We commend an American treatise on the Common Law (3), not merely to all the students of the Temple, but to all readers who have leisure and intelligence to devote to one of the most curious and instructive features of modern history, to one of the most remarkable instances of what historical and antiquarian science has lately chosen to call survivals. We recommend it, not because its author's name has an hereditary right to respect, is an hereditary promise of merit, but simply upon its own intrinsic value. Mr. O. W. Holmes, junior, shows at great length, and in many cases, how the strange principles of the Common Law came into being, and traces their gradual modification into accord with the necessities of modern life. They arose, as he points out with great force, and perhaps with still greater ingenuity, in certain universal but distinctly barbaric notions in the circumstances of a civilization very much more primitive and less complicated than that to which we first trace their historical application. The chapter on early forms of liability is in this respect peculiarly interesting, tracing the general notion of liability—which attaches often as distinctly, or even more distinctly, to things than to persons—if not actually to the childish and savage notion of revenge, alike on animate and inanimate instruments of injury, yet to the language which grew out of that feeling. He shows very cleverly and amusingly the application of this metaphorical language on the Bench of modern justice in sentences that somehow seem perfectly correct and reasonable, but, when examined, are hardly more logical than the anger of the child who beats the naughty chair on which it has fallen. The old rule as to the liability of the instruments of homicide—

Whatever moved to kill the dead
Is dead and forfeited—

illustrates very clearly this confusion of Christian and almost civilized ideas with simply savage childishness.

Mr. Chaplin's *Chips from the White House* (4) will do well for the only purpose to which chips are generally applicable. They are fit for nothing but to light the fire with, except one here and there that throws some unintended light, not on the wisdom, but on the folly, of some occupants of the Presidential mansion. John Quincy Adams, for example, passes for one of the wisest and most dignified among them, and is evidently a favourite with the compiler. But his abuse of men, his equals in character and his superiors in intellect and political capacity, reminds us even more of Mr. Ferrand than Mr. Bright. Thus John Randolph's speeches "are a farrago of commonplace declamation, a stream of malignity and inflated egotism, one-third brandy and two-thirds water." From the day that he quitted the walls of Harvard College, a score of the foremost gentlemen in America, all named, and all bearing names at least as honoured as his own, are said to have "used up their faculties in base and dirty tricks to thwart the progress and destroy the character" of John Quincy Adams. A more contemptible exhibition of egotistic petulance and almost insane conceit has never been given to the world even by so injudicious a biographer as Mr. J. A. Froude.

Mr. Thayer's *Tact, Push, and Principle* (5) is a solid volume of good advice to young men, about as likely to profit them as all the other good advice that young men have received since the beginning of the world, and will continue to receive until the day, apparently not far distant, when it shall be the recognized function of the young to give advice to their elders.

Messrs. Hamersley's *Naval Encyclopedia* (6) is a very heavy quarto volume, convenient, no doubt, as a book of reference, but, in so far as a non-professional critic can judge, rendered somewhat incomplete and unsatisfactory in the effort to make it available by bringing it within such moderate space. For example, all we are told of the French navy is confined within the space of a quarter of a page. A much greater space is given to the history of our own navy, but the account of its actual condition again occupies but a quarter of a page. We are afraid that the work will be found inadequate in point of detail and minuteness to the needs of professional students, while others will have but occasional need to refer to it. It contains, of course, an immense quantity of

valuable information condensed into small compass, on such subjects as explosives, cannon, ironclads, and so forth, which are of pretty nearly universal interest. Great pains have unquestionably been taken with it, and if the author's labours are not crowned with all the success he desires and deserves it will be because the task he has undertaken has been clogged with incompatible conditions.

Mr. Calvert's volume (7) on Coleridge, Shelley, and Goethe belongs to a class of books numerous and familiar alike to the present generation in England and America, books in which a moderate amount of information, and that not very novel, is expanded by a vast quantity of reflection and comment, not very profound or original; a kind of work for which literary biography offers of course peculiar and almost unlimited opportunities.

Very different indeed is Professor Stanley Hall's little volume on certain aspects of German culture (8). It deals chiefly with those topics in which German accuracy and profundity of study has contributed largely to the general knowledge of the world on scientific questions and philosophic problems which occupy the especial attention of the present age, and not least with those in which the contributions of German thought to the universal treasure of knowledge have been least obvious and least appreciated. One passage, of no great length, illustrates the tone and value of the work before us as hardly any description of its contents could do:—"I know an old mechanic whose work is about perfect, and who is so conscientious and painstaking that he can trust no assistant or apprentice with any important part, although he has orders in advance for far more than he can do at almost triple the ordinary rates. He has been offered a large sum to allow his business to be extended under his name and supervision, but cannot bring himself to do so because he fears the work would not be as thoroughly done as he wishes. Another, a glass-blower, who, like the late Herr Geiseler of Bonn, has already made science his debtor by the thoroughness and ingenuity with which he has more than filled the orders of a few professional patrons, persistently refuses far more tempting offers to work for the trade. I would by no means assert that such men are the rule; but they are very often found, and have given a programme to the large party of small makers and sellers here. In some respects their position is, perhaps, analogous to that of the best old farming families still found in a few New England communities, but they are far more numerous. According to a recent reviewer, this class puts both art and conscience into business, and is the germ from which the future State will grow, while the Socialists accuse the Government of adopting a policy in the new tax laws which is likely to exterminate this party of business regeneration."

Under the title of *Early Spring in Massachusetts* (9), an admirer of Mr. Thoreau has given us a solid octavo volume full of descriptive extracts from his journal, full of curious and interesting reflections, and as well written as if intended for publication; but, considering the nature of the subject, perhaps somewhat too full. Had Mr. Thoreau prepared such passages for publication he would, of course, have condensed them not a little, and have avoided the repetitions inseparable from the comments of a diary upon the recurrent phenomena of Nature. The character of a Massachusetts spring suggests a vivid interest in the use of the Open Fire-place (10), so generally wanting in America, a subject upon which Mr. Pickering Putnam has put forth a volume whose illustrations are certainly its most valuable and curious portion, a work whose nominal purpose is a little marred by the evident disposition to insist on the merits of certain recent inventions and improvements.

Mrs. Howe's little treatise on Modern Society (11) is marked by all the characteristics of that hardly feminine school to which the author obviously belongs. There is a tendency to denounce faults, or supposed faults, without attempting to trace them to their roots in human nature and the necessary conditions of society, and to discover how far they are or are not avoidable or curable, and that exaggeration, still more that misrepresentation, of the claims and functions of their sex which ever characterizes those who are disposed to desert its true offices for those that men can necessarily fulfil better than women. After all, the work of the world must be done by men, and woman's education, woman's character, woman's place therein must be governed by the one paramount consideration—what will best enable them to fulfil their relations to the other sex. The author is very bitter upon the dollar worship of the age, though not fully disposed to acknowledge how very much more distinctly it characterizes America, France, and perhaps England, than any other country. It would seem as if she wilfully refused to discern the obvious reason that, in America and France, democracy has extinguished almost every other social distinction. One of the great uses of aristocracy is its tendency to maintain at least two other sources and standards of personal eminence—birth and public service.

(3) *The Common Law*. By O. W. Holmes, junior. Boston: Little, Brown, & Co. 1881.

(4) *Chips from the White House; or, Selections from the Speeches, Diaries, Letters, &c., of all the Presidents of the United States*. Compiled by J. Chaplin. Boston: Lothrop & Co. London: Trübner & Co. 1881.

(5) *Tact, Push, and Principle*. By William M. Thayer, Author of "Quentin Jewett," &c. Boston: J. H. Earle. London: Trübner & Co. 1881.

(6) *A Naval Encyclopedia; containing Special Articles on Naval Art and Science*. 2 vol. Philadelphia: Hamersley & Co. London: Trübner & Co. 1881.

(7) *Coleridge, Shelley, Goethe: Biographic-Ethiotic Studies*. By G. H. Calvert. Boston: Lee & Shepard. London: Trübner & Co.

(8) *Aspects of German Culture*. By G. S. Hall, Ph.D. Boston: Osgood & Co. London: Trübner & Co. 1881.

(9) *Early Spring in Massachusetts*. From the Journal of Henry B. Thoreau, Author of "Walden," &c. Boston: Houghton, Mifflin, & Co. London: Trübner & Co. 1881.

(10) *The Open Fire-place in all Ages*. By J. Pickering Putnam. Illustrated. Boston: Osgood & Co. London: Trübner & Co. 1881.

(11) *Modern Society*. By Julia Ward Howe. Boston: Roberts Brothers. London: Trübner & Co. 1881.

Mrs. Judd's account of the Hawaiian Islands (12) is worthy the attention of those who are at all interested in the fortunes of a peculiar, amiable, and, we fear, a doomed community. Her sketches have at any rate the merit of comparative brevity, though there is a certain disproportion in the space given to different topics, not according to their intrinsic value or general interest, but to the connection of the writer therewith.

Mr. Emerton's *Life on the Sea-Shore* (13) is a modest, we fear a somewhat too terse and dry, contribution to the diffusion among the young of such a knowledge of natural history as can be acquired by and rendered useful to all.

Miss Bates's *Longfellow Birthday Book* (14) is a compilation from the works of Mr. Longfellow arranged upon, perhaps, the most absurd and arbitrary principle ever adopted by selectors, arbitrary and unreasonable as that class of book-makers ever are.

Somebody's Neighbours (15) is a collection of reprinted stories, and *Flirtation Camp* (16), a story of adventure in Californian wilds, differing from a multitude of recent and very popular publications chiefly in this, that the actors are adults, not schoolboys, and that the presence of ladies adds life, colour, and warmth to the scene.

We welcome a new volume of verse from Mr. Greenleaf Whittier (17), certainly not his best. Nothing of his is ever wanting in vigour and spirit; few of his meditative or narrative pieces approach in force, energy, and effect to those of pure invective, and certainly none of those in this volume equal the best of those invectives that, while slavery existed, made his well-deserved reputation.

(12) *Honolulu: Sketches of Life, Social, Political, and Religious, in the Hawaiian Islands, 1828-1861.* By Laura Fish Judd. New York: Randolph & Co. London: Trübner & Co.

(13) *Life on the Sea-Shore; or, Animals of our Coasts and Bays.* By James H. Emerton. Illustrated. Salem: G. A. Bates. London: Trübner & Co. 1881.

(14) *The Longfellow Birthday Book.* Arranged by Charlotte Fiske Bates. Boston: Houghton, Mifflin, & Co. London: Trübner & Co. 1881.

(15) *Somebody's Neighbours.* By Rose Terry Cooke. Boston: Osgood & Co. London: Trübner & Co. 1881.

(16) *Flirtation Camp; or, the Rifle, Rod, and Gun in California. A Sporting Romance.* By T. S. Van Dyke. New York: Fords, Howard, & Hulbert. London: Trübner & Co. 1881.

(17) *The King's Messive; and other Poems.* By John Greenleaf Whittier. Boston: Houghton, Mifflin, & Co. London: Trübner & Co. 1881.

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

THE UNITED STATES.

The Annual Subscription to the SATURDAY REVIEW, including postage to any part of the United States, is £1 10s. 4d., or \$7 58 gold, and may be forwarded direct to the Publisher, Mr. DAVID JONES, at the Office, 38 Southampton Street, Strand, or to Mr. B. F. STEVENS, American Agency, 4 Trafalgar Square, London. International Money Orders can be sent from any office in the United States, and Subscriptions, payable in advance, may commence at any time.

THE SATURDAY REVIEW

OF
POLITICS, LITERATURE, SCIENCE, AND ART.

Price 6d.

CONTENTS OF No. 1,331, APRIL 30, 1881:

The Funeral of Lord Beaconsfield.
Greece. The Land Bill Debate. America.
The Week's Outcry. English Land. The Bradford Difficulty.
The French in Tunis. Shooting in the Army.
M. Gambetta on Education.
The Church Quarterly on Gregory the Great.
The Way We Advertise Now. Snakes in the Flowers.
Mr. Burgess. Rogues and Vagabonds. French Critics and French Dramatists.
Joint-Stock Investments. The Anglo-French Commercial Treaty.
The Picture Galleries. The Theatres.
Fornerson's History of Philip II.
Harry Jocelyn. Budge's History of Esarhaddon.
The Story of a Soldier's Life. Life of Lord Clyde. Bent's Genoa.
Two Black-Letter Reprints. The Camp of Refuge.
American Literature.

CONTENTS OF No. 1,330, APRIL 23, 1881:

Lord Beaconsfield—Candahar—The Land Bill—The Tunis Expedition—South Africa—The Brighton Review—The French Opposition—Elementary Teachers.
The Edinburgh Review on "The Oxford School"—The Cant of Conscience—The Natural History Museum—Aryan Oddities—Iberian—Seals—The Mystery of S. J. W.—Mars—Engine-Driving—M. de Lavalley on the Approaching Scramble for Gold—The Theatres.
The London Foreign Secretaries—Virginibus Puerisque—From Exile—What is a Out?—Guthrie's Riddle—Haughton's Physical Geography—Buried Alive—Gaelic Proverbs—Pastoral Days—Acosta's History of the Indies—Farming in a Small Way.

London: Published at 38 SOUTHAMPTON STREET, STRAND, W.C.

ADVERTISEMENTS.

DORÉ'S GREAT WORKS, "CHRIST LEAVING the FRATERNITY," "CHRIST ENTERING JERUSALEM," and "MOSES BEFORE PHARAOH," each 25 by 35 cent; with "Dream of John's Wife," "Christian Martyr," &c. at the DORÉ GALLERY, 22 New Bond Street. Daily, Ten to Six. Is.

THE ANNUAL SPRING EXHIBITION of High-class PICTURES by BRITISH and FOREIGN ARTISTS, including Professor Leopold CARL MULLER'S picture, "An Engagement outside Cairo," is NOW OPEN, at ARTHUR TOOTH & SON'S GALLERY, 5 Haymarket. Admission, Is.

FRENCH GALLERY, 120 Pall Mall.—The TWENTY-EIGHTH ANNUAL EXHIBITION of PICTURES by Artists of the Continental Schools (including Portraits of the Right Hon. W. E. Gladstone, Prime Minister, Moltke, Dr. Dollinger, and other works by Franz Lenbach), is NOW OPEN. Admission, Is.

PALL MALL GALLERY, 48 Pall Mall.—On and after May 1 will be OPENED the EXHIBITION of PICTURES by the celebrated Russian Artist, AIVAZOVSKY. Aivazovsky's "COLUMBUS'S SHIP IN A STORM."

AIVAZOVSKY'S "COLUMBUS LANDING on the ISLAND OF SAN SALVADOR," and many other notable Paintings, at the PALL MALL GALLERY, 48 Pall Mall.—Admission, Is. Fridays, 2s. 6d. Catalogue, 6d.

THE GROSVENOR GALLERY.

SUMMER EXHIBITION.

WILL OPEN ON MONDAY, MAY 2.

ADMISSION, ONE SHILLING.

SEASON TICKETS, FIVE SHILLINGS.

BRITISH MUSEUM.—The BRITISH MUSEUM will be CLOSED on Monday the 2nd, and RE-OPENED on Monday the 8th of May. EDWARD A. BOND, Principal Librarian.

ARTISTS' GENERAL BENEVOLENT INSTITUTION,

For the Relief of Distressed Artists, their Widows and Orphans.
The ANNIVERSARY DINNER will take place in Willis's Rooms, on Saturday, May 14, at Six o'clock. The Right Hon. the EARL of ROSEBURY in the Chair.
Donations will be received and thankfully acknowledged by:
JOHN EVERETT MILLAR, R.A., Honorary Secretary.
PHILIP CHARLES HARDWICK, Treasurer.
F. LAMBE PRICE, Secretary, 34 Old Bond Street, W.
Dinner Tickets, including Wines, One Guinea.

M. PIERRE LAFFITTE (Director of Positivism) will give TWO PUBLIC LECTURES, in French, on Wednesdays, May 4 and 11, at Five P.M., at Newton Hall, Finsbury Lane, E.C.—"The Social and Moral Philosophy of the Eighteenth Century." Admission free.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.

For the Science and Practice of Agriculture.
For intending Land Owners and Occupiers, Land Agents, Surveyors, Colonists, &c.
The R. A. C. Farm, surrounding the College, is a mixed farm of about 300 Acres.
For Prospectus of Committee of Management.—The Right Hon. the Earl of DUCIE.
For Prospectus of College and Farm, List of Scholarships, Prizes, Diplomas, &c., apply to the PRINCIPAL.

LANDSCAPE GARDENING.—STUDENTS for the Profession will be received by Mr. EDWARD MILNER in the Crystal Palace Company's School of Gardening and Practical Floriculture after May 1.—For Prospectus, apply to the Under-Secretary at the Palace.

F. K. J. SHENTON,
Superintendent of the School of Art, Science, and Literature.

OWENS COLLEGE, Manchester.—The COUNCIL, having decided to found a new PROFESSORSHIP of APPLIED MATHEMATICS, invites applications from Gentlemen desirous of becoming Candidates. The fixed stipend is £200 per annum, in addition to two-thirds of the fees paid by Students.

The appointment will date from September 20 next. Further information respecting the duties of the Professor may be obtained from the PRINCIPAL of the College.
Applications and testimonials, addressed to the Council, will be received up to May 28.
J. HOLME NICHOLSON, Registrar.

SCHOOL for DAUGHTERS of GENTLEMEN, 34 Lad-broke Gardens, Kensington Park, W.—Preparations for the University Examinations. Plan of teaching similar to that of the High Schools. First professors and certificated governesses. Particular attention to diet and hygiene. Terms moderate.—For Prospectus apply to PRINCIPAL. Next Term begins May 3.

EDUCATION.—SCHOOL for the DAUGHTERS of GENTLEMEN, close to Kensington Gardens, recommended by Messrs. W. W. W. and GURNEY of Finsbury Square, W., who state that they cannot speak too highly of the educational arrangements of the school, which are conducted on a liberal scale by Eminent Professors, assisted by resident certificated governesses. Every attention is paid to the health, comfort, and happiness of the Pupils. The Next Term commences on May 3, 1881.—For Prospectus, apply to M. S., 30 Linden Gardens, Kensington Gardens, W.

THE Misses A. & R. LEECH'S SCHOOL for LITTLE BOYS will RE-OPEN on Tuesday, May 2, at 35 Kensington Gardens Square, Hyde Park, W. Arrangements are made for Daily Pupils.

THE DORECK LADIES' COLLEGE, 63 Kensington Gardens Square, London, W.—The SUMMER TERM will begin on Tuesday, May 2. Lady Principals—Miss M. E. BAILEY and Fraulein NEUHOFER.

THE DORECK COLLEGE.—CLASSES for the SONS of GENTLEMEN.—The SUMMER TERM will begin on Tuesday, May 2. Lady Principals—Miss M. E. BAILEY and Fraulein NEUHOFER, 63 Kensington Gardens Square, London, W.

THE DORECK COLLEGE KINDERGARTEN, 64 Kensington Gardens Square.—The SUMMER TERM will begin on Tuesday, May 2. Lady Principals—Miss M. E. BAILEY and Fraulein NEUHOFER.

EDUCATION.—GERMANY, BONN—on-the-Rhine, 37 Baum-schuler Allee.—The Fraulein KUNDE receives a limited number of YOUNG LADIES. Home comforts, best masters, unexceptionable references.—For particulars apply to the above.

CHELTEMHAM COLLEGE.—TWELVE SCHOLARSHIPS. Eight £40; Four £20. Election, third Tuesday in May.—Apply to the SECRETARY, The College, Cheltenham.

ENTRANCE SCHOLARSHIPS at the OXFORD MILITARY COLLEGE.—Two of £70 Two of £50, and Two of £25 a year, tenable for two years, will be offered after September. Candidates must either be Sons of Officers or claim to be intended for the Army. For some of the Scholarships they must be under Fifteen; for the rest under Sixteen.—For particulars apply to the HEADMASTER, Oxford Military College, Cowley, Oxford.

THE CONSERVATIVE PARTY.

ONE of the reporters of the proceedings at Hughenden stated, among other details, that the Duke of Richmond, Lord Salisbury, and Lord Cairns walked together after the funeral to the station at Wycombe. It may accordingly be inferred that the supposed competitors for the political succession of Lord Beaconsfield were then not on unfriendly terms. Any latent scepticism which might survive will have been removed by Sir Stafford Northcote's speech at Kettering. The most important functions of the office of Leader necessarily devolve on Sir Stafford Northcote, for none of his colleagues can pretend to control his conduct of Opposition in the House of Commons. As long as Lord Beaconsfield took part in affairs, it was inevitable that he should on great occasions decide the policy of the party. No other Conservative politician could pretend to compete with the claims of a statesman who had led the House of Commons nearly thirty years ago, and who had been twice Prime Minister. When Mr. Disraeli became Chancellor of the Exchequer in 1852, Sir Stafford Northcote had held no higher office than that of private secretary to Mr. Gladstone, followed by an appointment at the Board of Trade. His capacity was afterwards recognized by promotion to the offices of Secretary of the Treasury, Secretary for India, and of Chancellor of the Exchequer; and Lord Beaconsfield, when he left the House of Commons in 1876, showed sound judgment in his selection of a successor. Sir Stafford Northcote understood the details of business and the theory and practice of finance better than his brilliant chief; but they had no similarity of temperament, except that both were exempt from partisan bigotry. Sir Stafford Northcote would probably have devoted his attention to practical and useful legislation if the efforts of the Ministry had not, through the force of circumstances, been concentrated on foreign affairs. The urgent pressure of Eastern politics confirmed the ascendancy of Lord Beaconsfield, who had no resistance to apprehend in his own Cabinet after the secession of Lord Derby and Lord Carnarvon. Since the change of Government Lord Beaconsfield has probably interfered but seldom with the discretion of the leader of the House of Commons. On the front Opposition bench Sir Stafford Northcote has no rivalry to apprehend, since on his appointment Mr. Gathorne Hardy, who was perhaps a more effective debater, was translated to the House of Lords. Sir Richard Cross and Mr. W. H. Smith are excellent men of business, and efficient debaters, but neither pretends to be an orator. Mr. Stanhope and Lord George Hamilton can afford to wait for their turn as Parliamentary chiefs.

In modern times the leaders of parties have, with few exceptions, sat in the House of Commons. Within the last forty years Lord Melbourne, Lord Derby, Lord Russell, and Lord Beaconsfield have been Prime Ministers; but only the last has really decided the counsels of the party. Lord John Russell surpassed Lord Melbourne in authority and influence, and Mr. Disraeli bore a similar relation to Lord Derby. During their year of joint office, Mr. Gladstone overshadowed Lord Russell, who finally gave way to his indefatigable colleague, when they were driven from office. Sir Robert Peel, Lord John Russell, Lord Palmerston, Mr. Gladstone, and Mr. Disraeli have been real party leaders both in and out of office. The Duke of Wellington was content to represent the Conservative party in the House of Lords with second-

dary political rank; and on the other side Lord Lansdowne and Lord Granville have held the same position. The Duke of Richmond, from the resignation of Lord Derby to the accession of Mr. Disraeli to the peerage, did the Conservatives valuable service by rendering it possible for Lord Salisbury and the present Lord Derby to maintain an equality of political rank. It is not improbable that the same arrangement may be at least provisionally revived, though circumstances have materially changed. Lord Cairns would perhaps not be disposed to contest the claims of Lord Salisbury, though he has for a time discharged the duties of leader. It is not at present known whether either peer would be disposed to acknowledge the political superiority of Sir Stafford Northcote; in any case prudent politicians must deprecate the ill-timed controversy which has lately arisen as to his claims. The Duke of Richmond might advantageously undertake the duty of answering questions and providing for the conduct of debates, and so reassure the more timid members of the party. The practical selection of a leader will possibly be deferred till the Irish Land Bill is introduced into the House of Lords. In case the Conservative majority should unfortunately be divided on the question of acquiescence in irresistible injustice or of desperate resistance, the fractions of the party must severally select their own representatives in debate. Still that party has often shown a steadiness of discipline which has puzzled and incensed the minds of their opponents.

The choice of a leader of Opposition has sometimes involved the future nomination of a Prime Minister. The most formal appointment to such a post was that of Lord Hartington, when, on the temporary retirement of Mr. Gladstone, he was selected in preference to Mr. Forster. If Mr. Gladstone had not reconsidered his decision, Lord Hartington would now be either First Lord of the Treasury or principal Minister in the House of Commons. No similar patronage is at the disposal of the present Opposition. The informal office which is held by Sir Stafford Northcote confers both honour and political influence, but he will long have to confine himself to the function of criticism and resistance. The Ministers have so large a majority that the leader of Opposition cannot even wish, and much less hope, to displace and succeed them. Mr. Gladstone and his allies, after driving them out of office, are preparing to turn the key upon them by an organic change in the Constitution. The transfer of all electoral power to the working classes, with the readjustment of constituencies, will entirely alter the conditions of political life. The Conservative party has twice within living memory recovered from apparently hopeless prostration, under two leaders of dissimilar character and faculties. Sir Robert Peel was unrivalled in knowledge of business and practical ability; and he surpassed all men in the skill with which he profited by the errors of opponents. Within ten years from the passing of the Reform Bill, which seemed to have annihilated his party, he returned to office without a rival, and almost without an Opposition to face him. When his conscientious repudiation of a great economic mistake had broken up the compact body of Conservatives, Mr. Disraeli once more undertook the task of reconstituting a disorganized party. His success was not less surprising than that of his predecessor, though it was not equally complete. His ultimate triumph might perhaps have been permanent but for the external complications with which he had to

deal. Time will show whether it is possible once more to retrieve a ruinous defeat. The revolutionary changes which are now threatened may perhaps perpetuate the supremacy of the democratic faction.

If the task is feasible, it is more likely to be accomplished by the exercise of prudence and patience than by any stroke of genius or exhibition of daring. There is no doubt that a constant reaction against democratic encroachment is proceeding, for property and refinement are naturally hostile to the supremacy of numbers. The constituencies of 1832, which were once deemed revolutionary, would, if they had survived to the present time, have probably returned large Conservative majorities. The new experiment, to which both Mr. DISRAELI and Mr. GLADSTONE contributed, has resulted, with a brief interruption, in the election of the present House of Commons, and in the accession to power of Mr. GLADSTONE, Mr. BRIGHT, and Mr. CHAMBERLAIN. The Ballot has been even more mischievous than the extension of the suffrage; and the impending change will complete the work which is already far advanced. The rapid progress of democratic innovation has been remarkably illustrated by the recent history of France. All moderate politicians now appear to be permanently excluded from power, though only a few years ago the Republic of M. THIERS appeared only to be threatened by the reactionary or dynastic parties. English Liberals holding the opinions which seemed to prevail in Lord PALMERSTON'S time now almost despair of the possibility of maintaining the traditions and institutions with which they were familiar; but a more hopeful temper is laudable, and may possibly be justified by experience. If Sir STAFFORD NORTHCOTE has sufficient cheerfulness and courage to persevere in his opposition to the present Government, he will perform a great public service. In course of time he will probably be reinforced by numerous seceders from the Liberal party, if not by the whole body of those who were once called Whigs. He will not be tempted by the example of his predecessor to anticipate or further the democratic measures which he may probably be unable to resist. He must rely on the probably unanimous support of the upper and middle classes of society.

THE IRISH LAND BILL.

IT is, perhaps, not wholly disagreeable to the Government that the discussion on the Irish Land Bill drags itself along so slowly and with so many interruptions. They may possibly think that the intervals weaken the effect of what they cannot but acknowledge to be the damaging expositions of the unfair working of the measure as it stands. For some time it has been obvious that, numerous as are the points open to criticism, the heat of the battle will turn upon Clause 7. The arrangements by which tenant-right is to be created somewhere in space, and bestowed upon the tenant without in any way involving landlord wrong, were from the first detected as the weakest point of the whole; and, as the powerful speech of Mr. GIBSON first laid stress on them from the point of view of political advocacy, so did that of the late First Lord of the Admiralty on Monday last expose them from the point of view of the practical man of business. It is very remarkable that the objections urged have never yet been met, and have, indeed, scarcely been attempted to be met. Mr. FORSTER, with the somewhat awkward ingenuousness which characterizes him, took the bull by the horns, and declared that the clauses were not meant to mean what they obviously do mean. But this is cold comfort. The Irish ATTORNEY-GENERAL, when, after much waiting, he attempted to answer Mr. GIBSON, evaded the point; Mr. SHAW-LEFEVRE evaded it again in his answer to Mr. SMITH. As for favourable critics who are not under Government responsibility, it is needless to say that very little satisfaction is to be got from their remarks on the matter. It has been pointed out before, and it must continue to be pointed out until the Government take some notice of it, that what Mr. GIBSON and Mr. SMITH fear, what Mr. FORSTER and Mr. SHAW-LEFEVRE disclaim, is exactly what the Irish party in a body and a certain number of English Radicals advocate and hope for. What Mr. FORSTER thinks unfair these persons think the minimum of possible fairness; what he thinks is not in the Bill is in their eyes the very thing which, and which alone, makes the Bill worth having.

The injustice done to the landlord, or alleged to be done,

by those who take the clause in its obvious acceptation is twofold. In the first place, a great slice is cut out of his property by the arrangements for deducting compensation value from competition value in the fixing of a fair rent. In the second place, the enactment of the indestructibility of tenant-right malts him still further. He may buy up one tenant's right, but it revives in the next tenant. Both these things have been denied; but no one on the Government side has attempted to show that they are not true, and still less has anybody on the Government side offered to change the words of the Bill for other and unambiguous words, safeguarding the landlord's interest as well as the tenant's. This is the touchstone of sincerity in such a case. If Mr. FORSTER will add to the Bill a statement in so many words that the value of the tenant-right is not to affect or diminish the value of the landlord's right, and that an owner who has fairly extinguished the tenant-right may then occupy or let as he pleases, without incurring responsibility for anything except future improvements effected with his consent by the tenant for the time being, then critics of the Bill will know where they are. It cannot hurt the Government to do this, if, as they assert, it would be very unfair to the landlord that the construction, barred by such an addition, should be put on the Bill when it becomes an Act. But, at the same time, it is, to say the least, improbable that they will do anything of the kind. Prophecy is dangerous, but it is hardly dangerous to prophecy that such an alteration would make the measure the object of violent opposition from the whole Irish party. At the same time, the injustice of the construction itself is so clear, the language of the Government in reference to it has been so half-hearted, the thing is itself so monstrous when fairly considered, that even so obedient a majority as Mr. GLADSTONE'S can hardly be expected to pass this particular clause if the Opposition keep up their fire upon it in Committee without alteration. The present Parliament is capable of much. But it is difficult to believe that the majority of it is yet capable of affirming such a proposition as the following. There are, let it be supposed, two farms. One of them is conducted on the principles of the Portsmouth Estate, where not a farthing is spent by the landlord, and he is satisfied to take his rent-charge and let the tenants transfer the customary property he concedes them in their holdings as they please. The other is a farm on which the owner, at great cost, has made all improvements, and has bought up at the price fixed by the Court the interests of every kind of an outgoing tenant. Yet, if this owner re-lets his land, no matter at what rent, a fresh tenant-right is to spring up on it and to flourish, just as it flourishes on the other.

This injustice, and other such injustices as this, appear the more the Bill is considered. It does not follow that nothing is to be made of it. Unwise as it may be for the most part to attempt a kind of State patronage of a particular industry, the reclamation of waste lands, the buying up of the lands of those landlords who are willing to sell, and their resale on easy terms to peasant proprietors, are things which conceivably might be attended with fortunate results. The worst of it is that these results are not what are looked for by the Irish, and not that for which the supporters of the Government have encouraged the Irish to look. Mr. GLADSTONE'S short but most instructive speech on the Welsh Sunday Closing Bill throws floods of light on his attitude as to the more important measure which is now making its lame way through the Commons. The majority in any locality, no matter what their wishes, have only to express them, to come to Parliament with the expression, and it is the business of Parliament to carry those wishes out. Now, it is undoubtedly the wish of a majority of the population in certain districts of Ireland to pay no rent. It is probably the wish of the majority of the population in others (let us hope few and far between) to shoot the herds on grass-farms. It may be the wish of the majority in one or two to roast a certain number of bailiffs to encourage the others. Probably, Mr. GLADSTONE is not as yet ready to propose a Permissive Roasting Act, or to bring in a Bill for the better abolition of herds taking care of grass-farms; but his Welsh speech and his Irish measure lead to such things as a perfectly logical consequence. The singular thing is that all this, though it is clear enough, alips, to all appearance, off the mental backs of the majority even of Englishmen. The attitude of the Irishman—doubtless, in the main, and under favourable circumstances—a

good-natured fellow enough, who roasts or mutilates a bailiff at the bidding of the Land League; and the attitude of an Englishman, who regards the spoliation of landlords as a great act of national justice and statesmanlike policy, are curiously close to one another. Agitation, the companionship of leagues and federations, the constant repetition of well-sounding platitudes, deaden intellect and morality in the one case as in the other. It was remarked, not long ago, by a supporter of the Government, in a tone half argumentative and half exultant, that people who address the present electorate as if they were addressing the ten-pounders make a great mistake. That is, indeed, evident enough. The ten-pounder was not a model person; he did not much understand the higher politics, he was gullible if the right side of him could be got at. But he was not wholly indifferent to the national honour, he was not to be taken in by mere phrases, and, above all, the doctrine, men not measures, never wholly seduced him. Of his successor it does not appear that as much can be said. Still, the attitude of the English supporters of the Government is for the most part one of dubious acquiescence more than of sincere agreement. The attitude of the Irish members is becoming more and more complicated. Mr. PARNELL's formal amendment, the divided resolutions of the Home Rulers, and the curious parley between the Government and the Land League leaders as to a recommendation on the part of the latter in favour of the payment of rent, seem likely to introduce a new and possibly an interesting chapter in a history which has hitherto been somewhat dull.

GOVERNMENTS AND THEIR AGENTS ABROAD.

ALMOST any other subject of debate must be a relief to the House of Commons in the rare intervals of the Land Bill, yet only a small audience was found a week ago for a discussion on two not dissimilar subjects. Mr. PEASE's proposal to abolish the China opium trade had the advantage of being in a high degree practical, if only it had been likely to be accepted; but the sacrifice of seven millions of Indian revenue is too serious an enterprise to be undertaken without conclusive reasons. Mr. LAING's speech alone exhausted the subject, and Lord HARTINGTON added the usual official explanation. The money cannot be spared; and, if any other argument is needed, there are doubts whether the importation of Indian opium greatly increases the consumption, and even whether the use of the drug is uniformly noxious. According to Lord HARTINGTON, the practice chiefly prevails in the Western provinces, where no Indian opium has penetrated. The opium debate was preceded by the introduction of a motion of Mr. RICHARD's, which gave occasion for an instructive speech by Mr. GLADSTONE. Only a small majority in a thin House supported the Government in its refusal to adopt a wholly inadmissible resolution. The philanthropists had mustered in comparative strength to protest against war and opium. Mr. RICHARD asked the House to affirm the proposition that the power "claimed" and exercised by the representatives of this country in "various parts of the world to contract engagements, annex territories, &c., without the authority of the central Government, is at variance with recognized rules of international law, and is fraught with danger to the honour and true interests of the country." One objection to the resolution is that no such power is claimed, though it may sometimes be exercised; and, if the practice were inconsistent with recognized international law, it would be unnecessary to condemn it. In truth, the discretion which may be allowed to subordinate agents has nothing to do with international law. If the act of a civil or military officer is recognized and approved, foreign States look for redress exclusively to the Government. It is not the province of international law to distribute responsibility between Ministers and Governors, Commissioners or Generals.

Mr. GLADSTONE differs little from Mr. RICHARD either in his horror of war or in his freedom from that kind of sensitiveness which has generally been associated with a regard for the national honour; but as the representative of the Government he could scarcely sanction an indiscriminate limitation of the powers entrusted to its agents. In barbarous or half-civilized countries it is necessary for officers on the spot to resent insults and to repel, or sometimes to anticipate, attacks; and there is no reason to apprehend that in dealing with

regular Governments any subordinate agent will involve the country in a quarrel. In the only modern instances of such a misadventure the English Government was the offended party, and in both cases satisfaction for unauthorized acts was finally obtained. A French officer in Otaheite, nearly forty years ago, almost provoked a war between France and England by his lawless arrest of Mr. PRITCHARD, an English Consul. M. GUIZOT, notwithstanding the reproaches of the Opposition, at last disavowed the injustice which had been perpetrated, though he afterwards complained that Sir ROBERT PEEL had not been as easily satisfied as Lord ABERDEEN. A much grosser case was the stoppage of the *Trent* and the arrest of Mr. MASON and Mr. SLIDELL by the American Commodore WILKES. There was no doubt that the offending officer had, for the sake of obtaining popularity, deliberately violated international law; and at first it seemed that his calculation had been well founded. He was unanimously applauded in his own State of Massachusetts, and the Federal House of Representatives passed a resolution in approval of the outrage. Fortunately Lord PALMERSTON was then Prime Minister, and his immediate preparations for war had, as in some other instances, the effect of securing peace. The President determined to surrender the prisoners; and the warlike faction had to console itself with a blustering despatch, in which Mr. SEWARD announced that his Government would have set international law at defiance if it had not, for reasons of its own, been indifferent to the detention of the captives. For the only European war in which England has been engaged during more than sixty years the Ministers of the day were responsible. It is highly probable that the rupture with Russia might have been averted if the management of the negotiations had been entrusted to the Ambassador at Constantinople, or even to the Minister at St. Petersburg. The Emperor NICHOLAS, deriving his information from Baron BRUNNOW, who in turn listened to the pacific language of Lord ABERDEEN, repelled the warnings of Sir HAMILTON SEYMOUR with the frequent assurance that the English people were opposed to war.

It is true that Indian annexations have in many instances been effected by the Viceregal Government, or in early times by officers of less exalted rank, with little reference to the wishes of the authorities at home. WARREN HASTINGS and CLIVE, WELLESLEY and DALHOUSIE, prosecuted their Imperial policy with little regard for the timid warnings of the East India Directors and Proprietors. It may be added that, if they had been subject to such restrictions as those which are suggested by Mr. RICHARD, there would now be no Indian Empire to confine within its actual limits. It is said that on the eve of one of his expeditions Lord WELLESLEY detained the homeward-bound fleet for several weeks, that his designs might not be prematurely disclosed to his employers in England. Lord DALHOUSIE was almost as exclusively responsible for the annexation of Oude, and for the second Burmese war, which was not the unjustifiable transaction which Mr. RICHARD has been taught to consider it by his study of a pamphlet of Mr. COWDEN'S. Great statesmen bent on making their successors the first potentates in Asia, while they remained loyal subjects of the English Crown, would not have been effectually restrained by any resolution of the House of Commons. The impeachment of WARREN HASTINGS, which was promoted in vindication of the principles now maintained by Mr. RICHARD, ended, after many years, not only in acquittal, but in a general conviction of the injustice with which his services had been rewarded. Mr. RICHARD mentioned several instances in which functionaries of humbler rank had involved the country in war. The remedy for such excesses of power is to be found, not in Parliamentary resolutions, but in the enforcement of official discipline. As to the particulars of a petty war in the Malay peninsula, Mr. RICHARD seems to have been imperfectly informed. Mr. GLADSTONE's condemnation of the warlike proceedings of Sir JAMES BROOKE is inconsistent with the judgment of many of those who have studied the question, and his position was rather that of a private adventurer than that of a Government officer. Sir THEOPHILUS SHEPSTONE's precipitate annexation of the Transvaal was afterwards sanctioned by the Secretary of State and the Cabinet, and it was not disapproved by Parliament. The untoward war with the Zulus was condoned both by Lord BEACONSFIELD's Administration and by Mr. GLADSTONE'S.

Mr. RICHARD, whose object is not to enforce discipline, but to diminish the chances of war, may perhaps have been convinced by Mr. GLADSTONE's speech that the House of Commons and the nation are or really were as liable to warlike impulses as any Indian or Colonial functionary. The Crimean war was much more unpalatable to the House of Lords than to the House of Commons, and the House of Commons was impelled by the almost unanimous feeling of the country. In that instance, at least, popular enthusiasm was not capricious; for the terms of a patched-up peace were generally disapproved, notwithstanding the heavy sacrifices which had been sustained. Mr. GLADSTONE effectually destroyed that part of Mr. RICHARD's argument which was founded on Sir JOHN BOWRING's reprisals for the seizure of the *Arrow*. The many bitter enemies of Lord PALMERSTON took the opportunity to form a strange coalition for the purpose of driving the hated Minister from power. As Mr. GLADSTONE says, Lord DERRY was the first to denounce the China war, and he was cordially seconded by Mr. DISRAELI. Mr. CORDEN, Lord JOHN RUSSELL, and Mr. GLADSTONE united their forces with the Conservative leaders, and the Government was consequently placed in a minority. The result of the combination was nevertheless a severe disappointment to the confederates. Lord PALMERSTON appealed to the country which understood that the Chinese vote had been really intended as a censure on the prosecution of the Crimean war to a successful issue. The coalition was scattered to the winds; Mr. CORDEN and Mr. BRIGGS were temporarily excluded from Parliament; and Lord PALMERSTON returned with a large majority, pledged to nothing but to the support of the Government. The nation had on this occasion been as warlike as the most ambitious of agents abroad. Mr. GLADSTONE took occasion to correct the error which had been zealously cultivated by his partisans, without protest from himself, that Lord BEACONSFIELD's policy, whatever may have been its merits, was in any respect unconstitutional. Two or three years ago Liberal politicians countenanced the fallacies of a factious pamphlet, written to prove that the Ministers had unduly strained the prerogative of the Crown. It was for the time difficult to convince heated opponents of the Government that the predominance of a Minister with a large majority conformed to the strictest requisitions of constitutional propriety. The pamphleteer almost succeeded in his object of making the QUEEN personally responsible for her conscientious deference to the advice of her responsible Minister. Mr. GLADSTONE now reminds the House that Lord BEACONSFIELD and his colleagues rather checked than stimulated the patriotic zeal of the House of Commons. Of the feeling itself he consistently disapproves, but he rightly distributed the blame or praise which may be due. The only security against a turbulent policy is, according to Mr. GLADSTONE, the cultivation of a moderate, just, and pacific temper, by those who from time to time direct the councils of the nation. No objection can be taken to his doctrine if justice and prudence are combined with a delicate and resolute regard for the rights, the welfare, and the honour of the country. Tame submission to wrong is the worst of all methods of attempting to preserve the peace.

THE OCCUPATION OF BISERTA.

THE French have occupied without resistance the little town of Biserta. Four ironclads appeared off the town on Sunday, demanding that the place should be given up, and it was given up. This is much the most important step taken since the French troops crossed the frontier. Tabarca, it now appears, was not taken without resistance, as the Governor of the place would not go away without doing some damage to those who were bombarding forts belonging to his master with whom the bombardiers were at peace. He had been directed by the Bey to retire without fighting, but the temptation to fire at those who were firing at him was too strong. He may safely calculate that when the war is over his master will not resent his disobedience with any great severity. Kef made no resistance, but it only surrendered on the display of overwhelming force. The French artillery was in position, and was ready to open fire when the Governor complied with a summons to yield. These were distinct acts of war against a ruler with whom France claims to be at peace. But then it might be plan-

sibly extended that the occupation of Tabarca and Kef were measures indispensable for subduing the Kroumirs. The Bey would not co-operate with France in punishing the Kroumirs, and when France announced that it would take on itself the whole task of inflicting punishment, the points necessary for carrying out the process had to be occupied, whether the Bey consented to the occupation or not. But occupying Biserta is quite a different thing. Biserta is far away from the Kroumir country, and there can be no connexion between occupying it and putting down tribes in a totally different part of the territory of Tunis. The French Government must have had motives for ordering the occupation of Biserta which were only very indirectly connected with what it still alleges to be the sole object of its enterprise. Biserta, although far away from the Kroumirs, is not far from the capital of the Bey, and the principal object in seizing on Biserta must have been to overawe the Bey. If he dare, he would undoubtedly do his best to help the Kroumirs, and a large portion of his subjects is burning to take vengeance on the invaders. It may have seemed to the French Government that the surest way to keep the Bey and his subjects quiet was to seize on a point which showed that France could easily operate at the same time against the Kroumirs and against Tunis itself. But this was not the only gain in occupying Biserta. France has had to decide whether it will permit the Porte to intervene as the Suzerain of Tunis, and it has decided that it will not. It does not recognize that the Porte has any more authority over Tunis than over Morocco. In such a controversy words might follow words, and despatch might follow despatch, and nothing be settled. A rapid and effectual mode of giving a practical turn to the discussion suggested itself in the occupation of a town so far away from the scene of the main expedition that the authority of the Porte would be distinctly challenged; and it would have to own that, if it chose to claim the Bey as its vassal, it could do nothing to protect him.

The occupation of Biserta caused great and natural commotion in Italy. Biserta is a poor deserted place, but it possesses a harbour which in old days was famous, which might probably be made as good as it ever was at no great expense, and which is in very unpleasant proximity to Sicily. If the French permanently hold Biserta, it would be to the Italians much the same thing as if they held Tunis itself. Possibly the French Government was not displeased with the reflection that, if it was overawing the Bey and challenging the Porte, it was also frightening Italy. The contest at Tunis between France and Italy has been not only a political but a personal one. The French Consul has done all he can to spite the Italian Consul, and the Italian Consul has worked his hardest to spite the French Consul. One of the complaints most frequently and persistently made by the French Consul has been that his Italian rival has had printed in Sardinia an Arabic journal intended for distribution among the Tunisian Arabs, in which everything was said that could be imagined to incite the common people of Tunis against the French, and to prepare it for a rising against them. The French Consul-General has now, as he says, got hold of the agent employed for the purpose, and is able, as he alleges, to tell the whole story of the concoction and gratuitous distribution of this journal. The French theory is, that the border tribes partly harass and partly incite to disaffection the Algerian Arabs, that the border tribes are pushed on by the country population of Tunis, that this population is pushed on by the Italian Consul and his paper, that the Italian Consul is supported by the PRIME MINISTER, and that the PRIME MINISTER guides the Bey. The occupation of Biserta was therefore probably intended to break this chain of impulse at the point where higher influences began to tell on the country population. The Italian Consul is not likely to acknowledge that he has done all his rival says he has done; but, so far as he could not help acknowledging it, he would naturally defend himself on the ground that France claimed an exclusive interest in Tunis to which it was not in any way entitled, and that he had to counteract the excessive and unjust influence in the best way he could. But this would only make conspicuous the great advantage which France has in all controversies as to Tunis. Other Powers can only point to future political dangers. They can insist on the impolicy of violent action which may lead to disturbance in Europe, or can base their arguments

on the general necessity of maintaining the balance of power in the Mediterranean. France can point to a pressing immediate local danger. She can say that Tunis hinders her in the work of governing and civilizing Algeria. It may not be easy to prove, but it is still harder to disprove, that the real danger to Algeria comes, not from a handful of Kroumirs, but from the stirring up of an Arab population against France, which has a contiguous Arab population of its own. The meaning of the punishment of the Kroumirs thus attains new and large proportions. The Kroumirs are not to be merely punished, but rendered permanently incapable of doing harm. To ensure this, those who push them on must be made to feel that they, too, are under the strong hand of France; and to make them feel this the French have occupied Biserta.

Italy, however, whether she dislikes the occupation of Biserta or not, can do nothing directly and for herself. When Signor CAIROLI resigned because the Chamber pronounced him not to have taken a line towards France sufficiently bold, when it was proved that no one could be found to succeed him, and he had to be reinstated in power, it was made evident that Italy was not really prepared to take a bold line with France, and could find no Power to support her in taking it. Italy has accordingly now put herself, so to speak, under the shelter of England. It is to England that assurances are given of the objects of the Tunis expedition, and it is from England that Italy learns what these assurances are. Sir CHARLES DILKE has been asked in the House of Commons whether he thinks that the permanent annexation of Biserta would be consistent with the assurances given by France, and he had but one reply to give—that it would not be consistent. There is not the slightest reason to suppose that France means to declare that it has annexed Biserta. The French Government has intimated that it hopes, when the Chamber reassembles, to be able to state that the objects of the expedition have been attained. The operations of the French troops have been delayed by deluges of rain, but directly the weather permits the final operations against the Kroumirs can be rapidly despatched. The different divisions are now so posted that they can converge to a central point, to which it is expected that the Kroumirs will be driven. The Kroumirs may not consent to be driven to a central point, and may slip away, but the converging divisions will sweep the country and destroy at once the humble possessions of the tribes and all power of resistance. The fighting power of the Kroumirs was gone when they found that Tabarca and Kef were occupied, in spite of the protests of the Bey. They may choose to die fighting or not, and they may possibly keep up a lingering guerilla warfare after they are nominally subdued, but the main military operation of the French will have been undertaken and performed. But the French Government has not only to deal with the Kroumirs, but with the Bey. It will be sure to demand that he shall give sufficient pledges that there shall be no more danger to Algeria from Tunis. What it will ask for will be limited by the necessity of showing to other Powers, and especially to England, that it can be plausibly connected with danger to Algeria; but within those limits it will be very possible for France to make demands which the Bey will be unwilling to grant. There is no chance of his granting anything before the French Chamber meets, and in this sense it is impossible that the Tunis affair should be by that time at an end. He will refer to the Porte, and the Porte will refer to the Powers, and the Powers will refer to France, and France will say that it has nothing to do with the Porte, and will only deal with the Bey himself. Negotiations will drag on, but meantime the French will hold Biserta; and, if the Bey does not choose to come to terms, they will hold it until he does. The occupation of Biserta may be thus said to have been devised with a view to the meeting of the French Chamber, as well as for other objects. If the weather changes, and the troops can operate in the next few days, the French Government may be able to say to the Chamber that it has virtually accomplished its purpose; for the main military operation will be over, the time for negotiations will have come, and France will hold a substantial guarantee for the satisfactory issue of these negotiations.

THE WELSH SUNDAY CLOSING BILL.

THE venerable objection to admitting the thin end of the wedge turns out to have more force in it than it has lately been the fashion to suppose. It seemed sensible enough to say that each case in which it was proposed to make a change in the law ought to be determined on its own merits. The fact that there were good reasons for making the change in the particular instance would not necessitate making it in any other instance, unless the reasons in favour of it were equally good. Unfortunately, there are a great many people with whom a precedent is of more weight than any number of arguments. If a thing has been done once, they are perfectly satisfied that it should be done again. The House of Commons was under the influence of this sentiment on Wednesday, when it read the Welsh Sunday Closing Bill a second time. What has become of the stout resistance that not long ago was offered to a similar measure for Ireland? It has disappeared before the irresistible consideration that what has been conceded to Scotland and Ireland cannot be refused to Wales. The unhappy FORBES-MACKENZIE Act is at the bottom of the whole business. Parliament consented to pass that ill-omened measure, in the belief that Scotland was so unlike any other country that legislation might safely be settled to its sole and separate use. It now appears that, whatever other differences may exist between Scotland and the rest of the United Kingdom, Scotch, Irish, and English fanaticism are all cut out of the same piece. No two nations could seem more unlike than the Scotch and the Irish; but, so soon as the agitation in favour of closing public-houses got possession of them, they became virtually indistinguishable. Now Dissenting Wales has followed in the footsteps of Presbyterian Scotland and Catholic Ireland. The difference of religion seems to count for absolutely nothing. Irishmen are not inclined to Sabbatarianism; Welshmen are. Irishmen see no harm in crowding the pleasures of a whole week into the Sunday; Welshmen rather regard it as a day on which it specially becomes them to afflict their souls. But neither the creed which teaches men that Sunday is a feast, nor the creed which persuades them that it ought to be a fast, can find any place in its system for the public-house. That is equally condemned by both. When it has been shown that a certain percentage, real or imaginary, of Welshmen have signified their assent to Mr. ROBERTS's Bill, those who voted for the Scotch and Irish measures feel that it would be impossible to explain in a way which will satisfy Welshmen their motives for not voting for the Welsh Bill. The consequence is that it is read a second time by an overwhelming majority, and has every chance of being allowed, as Mr. GLADSTONE puts it, "honourably and kindly to take its place in the Statute Book." What is permitted in the case of Wales will next perhaps be demanded on behalf of some English county. If Wales is different from England, so is the South of England different from the North, and the manufacturing districts from the agricultural. The moment that it seems possible to get a majority of the ratepayers anywhere to say that they wish to see public-houses closed on Sundays, Sir WILFRID LAWSON will not be wanting to the occasion. It was very well for Colonel MAKINS to make it "clearly understood" on Wednesday that, though he did not oppose Mr. ROBERTS's Bill, he "must not be expected" to abstain from offering opposition to a proposal to apply the same measure to England; but, whether it is expected of him or not, it is pretty certain that, when the critical moment comes, he will not offer it. The particular county for which it is proposed to legislate will be found to be marked off in quite a remarkable way from all its neighbours; and after this plea has been listened to in a certain number of instances, the advocates of Sunday closing will once more become impressed with the advantages of uniformity, and the remaining counties will have their public-houses closed, in order that they may not constitute an anomalous exception to the rest.

It is not often that we find ourselves in complete agreement with Mr. PETER TAYLOR. But his speech on Wednesday was characterized by a really refreshing savour of common sense. He would not allow that any conceivable case could under any conceivable circumstances be made out for Mr. ROBERTS's Bill. If all Wales was in favour of it, then there was no need to do by law what the Welsh were prepared to do without law. If there was a considerable minority against it, that minority ought not

to be tyrannized over by the majority. If the minority were a small one, it was all the more necessary to give it legislative protection against the majority. Mr. TAYLOR has not yet come to see the beauty of legislation which makes the State interfere with one set of individuals because another and larger set wish to have their own theories of life invested with the force of law. His Radicalism is evidently behind the time, and he has much to learn from those bolder spirits who take no pleasure in doing, or abstaining from doing, a thing themselves unless they can compel some one else to follow their example. Mr. GLADSTONE and the *Times* are pleased to say that Sunday closing, like closing at a certain hour at night, is simply a question of police. That depends in a great measure upon the motives by which the supporters of the Bill are actuated. The part played by the police in the regulation of the traffic in strong drink is justified by the disastrous effect which that traffic sometimes exercises on public order. If public-houses were open all night, for example, the confusion that would ensue might easily pass beyond police control. If it could be contended that Welshmen are so exceptionally constituted that one glass of liquor, when taken on a Sunday, qualifies them, one and all, for immediate admission to a police-cell, it is possible that Mr. ROBERTS's Bill might be the only remedy of which the case would admit. But the Welsh members who spoke on Wednesday vied with one another in describing Wales as a moral paradise. Mr. RATHBONE could "say unhesitatingly that there "was no part of the United Kingdom in which the "law was more implicitly obeyed or in which there "were fewer offences against it than in Wales." Mr. OSBORNE MORGAN declared that "crime is almost as unknown in Wales as Conservatism." Mr. JAMES pointed with conscious pride to the fact that in Wales the churches and chapels are full, while the gaols are empty. It is surprising that, when Wales is already thus perfect, her representatives are not afraid of meddling with the happy combination of conditions which has made her so. Perhaps it may turn out that the Sunday visit to the public-house is the source not of the rare instances of Welsh vice, but of the customary plethora of Welsh virtue. Mr. ROBERTS may yet discover that he has been wrong in striving to gild refined gold, and to make Welshmen more lovely and of better report than they already are. It might be safer to treat the momentary backsliding of the Sunday, when the open door of a public-house suggests that society and refreshment are to be had within, as a useful check upon spiritual pride. When such a picture as this can be painted of the principality, it is almost a contradiction in terms to speak of Sunday closing as a question of police. The very word suggests disorder and violence, and there can be little room for either in the daily life of Welshmen. Consequently, the motives of Mr. ROBERTS and his friends must be looked for in quite other directions than that indicated by Mr. GLADSTONE. If the hearty supporters of the Bill could be subjected to analysis, it would probably be found that one-half of them were total abstainers and the other half fanatical devotees of Sabbath observance. The former regard Sunday closing as a useful stepping-stone to closing on week-days; the latter are bent upon giving effect to their peculiar convictions in entire disregard of the convenience of the community.

It is needless to say that there is not one of the arguments used in support of Sunday closing which would not be equally applicable to Sir WILFRID LAWSON's pet scheme of closing public-houses altogether wherever the district in which they are situated is in favour of it. Indeed, Sir WILFRID LAWSON may point to Mr. GLADSTONE's speech as showing a very marked advance in the direction in which he wishes him to go. "The question," he said, "when "it comes to be decided for England, will have to be "decided with reference to the public opinion of England." This admission really involves everything that Sir WILFRID LAWSON can care to establish. "Local opinion," Mr. GLADSTONE declares, "ought to have considerable weight"; and Wales is modest in claiming only to have her public-houses closed on Sundays and not on week-days as well. If local opinion is really to have considerable weight in deciding how many public-houses there shall be, and for how many hours in the day they shall remain open, we do not see that it can be got at better than in the way which Sir WILFRID LAWSON suggests. Indeed, a Local Option Bill, whenever it is introduced, will have some recommendations which are wanting to

a Sunday Closing Bill. The one proposes to close public-houses on Sundays over the whole area to which it relates; the other will only propose to give the rate-payers of each district leave to close so many of them as they like, and at such times as they like. It will not be hard to make out that Parliament is less committed by this latter proposal than by the former. If Mr. GLADSTONE lives long enough, he will probably be found maintaining that even a Maine Liquor Law is only a question of police.

GERMANY.

PRINCE BISMARCK, who is never quite himself unless he is quarrelling with some one, has selected as his last victim a body comparatively so humble as the Municipality of Berlin. He has this time been wounded in his pocket, and he screams out, bullies, and threatens with all his wonted vivacity and recklessness. It is a pleasure to him, as it was to the First NAPOLEON, to ascertain, by practical experience, how much every one around him can be made to stand. He has pondered long and deeply on human nature, and he has assured himself that human nature will stand anything if it is once sufficiently frightened. NAPOLEON was simply brutal, not only to the men, but to the women, who composed his singular Court; but he brought home to them every day and every hour that it was only through him that they had any existence at all above that of a day labourer. The indispensable man can charge what he pleases for being indispensable. The offence of the Berlin Municipality was that it had rated Prince BISMARCK's official residence at the value which it would have possessed in private hands. The PRINCE, in reply, hinted broadly that Berlin was a nest of Progressists, and that the Progressists in office used their petty power to put a specially heavy tax on his house because they hated him. But this was so plainly a question of figures, and so capable of easy disproof, that he had to merge his grievance in that of the 250 and odd Government officials at Berlin who all have residences allotted to them, and all have to pay in taxes more than in proportion to their salaries. Little pay and a fine house to spend it on is an inconvenience in many ways, and the disadvantages of useless splendour are brought home to a poor man when he is taxed as if he had money enough to live comfortably in a house far too big for him. It might be supposed that the remedy was in the hands of the Government, which could curtail the magnificence of the residences of its officials, or give them better salaries, or simply pay the taxes which inadequate salaries do not enable them to meet. But Prince BISMARCK did not want to make an equitable arrangement for the officials, but to snub his enemies, the Town-Councillors of Berlin. He therefore brought in a Bill providing that Government officials should not be taxed to an extent exceeding ten per cent. of their salaries. He got a Committee to agree to this, with the substitution of fifteen per cent. for ten, and he got his proposal, thus modified, accepted by a majority of six on a division in the Reichsrath. This was not much of a victory, but he got an opportunity of launching his thunderbolts at his enemies. The Progressists of Berlin had offended him, and must be brought to their senses, and he let them know that there was much more in store for them than an alteration in the law regulating the tax on houses. He foreshadowed the awful doom that was hanging over them and the unruly city which they mismanaged, but only too faithfully represented. He had it in his mind to deprive Berlin of the angust presence of the Reichsrath. It should no longer be the seat of the Imperial Parliament. Germany, and all that is great and wise in Germany, should no longer flock to Berlin, but to some very humble place like Cassel. There is no Progressist ring there to vex the CHANCELLOR's soul; there are no gorgeous houses on which iniquitous taxes could be levied. Peace and simplicity reign at Cassel, and to Cassel the Imperial Parliament would go, leaving impenitent Berlin to mourn its loss, if the CHANCELLOR chose to give the order he threatened.

No one, not even the Germans who treasure up Prince BISMARCK's words as oracles, thought that this time the great man was quite serious. It is not a very easy matter practically to change the seat of a Parliament. Ministers, and the vast tribe of officials under

them, cannot work at all unless they are close to their offices, and, with the Court and the Ministerial offices at Berlin and the Parliament at Cassel, no business could be got through in Parliament. No serious attention could be paid to the threat of Prince BISMARCK; but, what is really remarkable in it is, not the threat to Berlin implied in it—for the PRINCE is equally ready to threaten the highest and the lowest of mankind—but the strange estimate of the worth and dignity of the Imperial Parliament which it revealed. It seems never to have occurred to Prince BISMARCK that the Parliament would have to say whether it wished to leave Berlin and go to Cassel. He might not, after all, do anything so awful as ride away from Berlin; but he took it as a matter of course that, if he did ride away, the Parliament would merely touch its hat, and rifle, like his groom, behind him. He did not appear to have the slightest desire to insult or annoy the Parliament, but his mind was so thoroughly pervaded by a low opinion of the Parliament, that it never occurred to him that it could be insulted or annoyed. The Reichsrath is fast lapsing into a very poor specimen of a Parliament. It is becoming what is called in Russia a jolly-like institution. It is flabby and incoherent. It is supremely bored by the tedium of its existence. Early in the Session there was a proposal which, it might have been thought, would have awakened up any Parliament—that it should only meet every other year. There was no quorum; so the discussion could not go on. Just before Easter there was to be a great investigation into the advisability of making drunkenness more severely punishable; and what could be more interesting in a land of beer? Again there was no quorum and no discussion. The CHANCELLOR'S great Bill for helping the insurance of artisans by State aid has got into a Committee, but nothing seems able to get it out. He himself has announced that he does not see any prospect of the Bill passing this Session; and he only got his majority of six for his Bill to reduce the taxation of his house by the assistance of the Clerical party, who acknowledged in this way that he had not been plaguing them recently so much as usual. On one occasion, and on one only, the Reichsrath has this Session taken the initiative, and acted with the weight of a decisive and united majority. Shortly after the assassination of the CZAR, it resolved to ask the Government to take steps with all other Governments for the detection and punishment of intending or actual assassins. But it was only unanimous and decided because it conceived it to be no part of its business to examine what steps could be taken. If it had stayed till it ascertained what it meant, there would have soon been no quorum. To think or to act is not the sort of business that will take provincial lotus-eaters to Berlin. It happened, however, to fall in with the views of Prince BISMARCK that he should be thus called on to do something. In concert with Russia he wished to make a new European combination against the revolutionary party, and he sounded the other leading Governments on the subject. The scheme, if it ever attained consistency enough to deserve to be called a scheme, has now fallen through. England and France refused to have anything to do with it, and, encouraged by their example, Italy, and even Austria, have joined in the refusal. The reason why the scheme collapsed is obvious. If a foreigner, having murdered, or attempted to murder, a sovereign abroad, comes to England, and sufficient evidence of his guilt is given to satisfy a magistrate, he is handed over. If while in England he contrives himself, or incites others to contrive, the murder of a foreign sovereign, he commits an offence for which, if a jury finds him guilty, he is punishable, and ought to be duly punished, by English law. All beyond this is a matter, not of law, but of police, and independent nations cannot let their police do the work of the police of foreigners.

Apart from Prince BISMARCK and the Reichsrath, German life still flows on, showing, like the life of other nations, sometimes its good and sometimes its bad side. The Anti-Semitic agitation still continues, and Prince BISMARCK is too well aware of its probable influence at the coming elections to quarrel with it openly. He said lately, in the Reichsrath, that he did not himself approve of it, but that he had, he owned, sent a most polite message in answer to a telegram telling him of the success of a meeting of Jew-haters. He had sent this message, not because he hated the Jews, but because he was a most polite man, and was always polite to every one. This seems a wonderful tax

on the credulity of his hearers, but there is no reason to suppose that he meant to say anything but what was to him an obvious truth. He has got an ideal BISMARCK, in whose existence he firmly believes; and, probably, if there is one thing in the world of which he is profoundly convinced, it is that he is a courteous Christian hero. But Germans have other and better things to think of than bullying the Jews. In the first place, there are their forecasts of weather. The PRINCE and the Progressists actually shook hands the other day over meteorology. They stood reconciled on the neutral ground of the North Pole. It appears that the Germans make forecasts of weather, which are only wrong once in every four times, and they do not understand how wonderfully lucky they are to be so often right. Their scientific men have suggested that almost absolute correctness might be attained if only a new series of stations was established going as far towards the North Pole as practicable. Prince BISMARCK was quite touched with the proposal, and promised to do all in his power to carry it out. The Germans are really great travellers, and show much courage and patience in distant and dangerous expeditions. One of their celebrities, Dr. LETZ, has just returned from a very successful, although difficult, wandering from Tangier to Timbuctoo, and not only has he done the things which travellers in that part of the world often fail to do, but he has had the satisfaction, so dear to the scientific mind, of exploding two popular errors. He has knocked all the poetry out of Timbuctoo, and has reduced its ancient or fabled magnificence down to an assemblage of huts with a starving and inconsiderable population. Then he has, so to speak, barred the flooding of the Sahara and the creation of a vast inland sea by ascertaining the simple fact that the Sahara is not a basin at all, but a plateau or succession of hills far above the level of the Mediterranean. Germans pride themselves, and most legitimately, on their men of science, and they will duly appreciate and enjoy these results of the labours of Dr. LETZ. But they pride themselves still more on their princes, and they have just had an opportunity of showing how deep and effusive this pride in their sovereigns can be. The Duke of BRUNSWICK has now reigned for fifty years, and the day of his jubilee has been kept with rapture by Brunswick and by Germany. Nothing, it is said, could have been more touching, more hearty, more German, than the outburst of love and loyalty displayed in the quiet city of Brunswick both by those who lived and by those who came there. The peculiarity of the Duke's life and the secret of his intense popularity in the evening of his life seems to have been that for fifty years he has done nothing. He has hurt no one and helped no one, and the people among whom he lived hardly knew him by sight. When at last, after fifty years of residence, he actually went about the streets of his capital in a close carriage, it was natural that the rapture of the most rapturous of people should overflow, that flowers should be strown in his path, and blessings invoked on his venerable head.

SOUTH AFRICA.

THE Cape Colonists are in a happier condition than their neighbours in the East; for peace is concluded with the Basutos, while the negotiations for the settlement of the Transvaal are beginning with little prospect of a satisfactory issue. Mr. SMITH has defeated, by a narrow majority, a vote of censure on the policy and conduct of a war which seems to have been unnecessary, but which has been prosecuted with creditable energy. It is thought that the Basutos would have accepted, in the first instance, the nominal compromise which he embodied in the terms of peace. They now agree to disarmament with the understanding that, on the payment of the considerable tax of 1*l.*, any native who is not suspected of illicit designs may retain his rifle. It may be confidently conjectured that the Basutos in general will keep their weapons without incurring the cost of a licence; but, although the peace imposes on them but a nominal sacrifice, there is reason to suppose that they were tired of the war. Their principal chief put an end to hostilities by surrendering himself on the sole condition that the English Governor should arbitrate on his case. The Basutos had perhaps arrived at the conviction that they would be beaten in the long run,

although the colonial troops had not achieved any decisive success. Both parties may perhaps be better friends after a contest which proves that the civilized combatant is on the whole the stronger, and that the Basutos have the means of making themselves formidable or troublesome. The nominal claim of the Home Government to interfere at the close of the war for the protection of the natives may be conveniently waived, since it has been ascertained that oppression cannot be practised with impunity. Mr. SPRIGG and the party which maintains him in office have displayed considerable firmness of purpose in dispensing throughout the contest with Imperial aid. It is evident that, although responsible government may have been prematurely introduced, it could not have been long withheld from colonists who are prepared to fight their own battles.

The debate which ended in the acquittal of the Ministers may perhaps have represented a certain feeling of antagonism between the English and Dutch races in the colony. The Cape Boers have never been earnest in the war; and a contingent which they furnished to the army took occasion to retire from the field in the middle of a battle. The Dutch colonists have not been pre-eminently well disposed to the natives; but they may have wished to drive Mr. SPRIGG and his colleagues from office. As far as the conflict was a result of rivalry of blood and language, it is satisfactory to learn that the English interest has prevailed. Mr. SPRIGG, who is urged by his adversaries to take the opinion of the constituencies on his policy, will probably not follow unfriendly advice. The Dutch are a majority in the western provinces, and, perhaps, in the colony as a whole; and recent events in South Africa may possibly have produced a feeling of uneasiness tending to disaffection. There is no response to the appeal of the Transvaal Boers to the non-English inhabitants of the colony. A South African Republic from which English settlers were to be excluded is still only proposed by agitators in the Transvaal. The section of the community which promoted and managed the Basuto war would not be easily expelled from its property and its native land. Demagogues always exaggerate the dangers and the imminence of the civil conflicts which they foretell and provoke. The colonists of Dutch, French, and German descent may not be enthusiastically devoted to the English Crown, but they have never shown a disposition to rebel. Some of them may, perhaps, have read with surprised amusement the warnings of English alarmists, who are more ethnological in their political theories than the mixed population of the Cape. The warlike native tribes, though they have nothing to say to political controversies, exercise an unconscious pressure on the people of the colony. Europeans, if they were otherwise disposed to quarrel, could not prudently engage in civil war while a third belligerent stood ready to take part with one of the principals or to profit by the weakness of both.

It is possible that the same forces may exercise an influence on the settlement which is, under almost insuperable difficulties, to be attempted in the Transvaal. Before the conclusion of the hurried peace the English generals rightly declined to avail themselves of the offered services of the natives. Uncivilized allies cannot be restrained from acts for which those who accept their services are held responsible. A century ago CHATHAM denounced the English Ministers for employing against the rebels those "horrible hellhounds of war," the Red Indians of North America. In the present day opinion is still more scrupulous; and it is felt that civilized men have a common interest in repressing the efforts of savages. Even if war with the Boers breaks out again, in spite of the exertions and sacrifices of the English Government, it would not be permissible to enlist the natives in the cause; but experience has already shown that they are fully alive to the danger which threatens themselves from the re-establishment of Boer dominion. To them the English Government, which has in all parts of the world treated uncivilized subjects with humanity, is the representative of law and justice. If the evidence of correspondents on the spot may be trusted, the natives, who are far more numerous than the white inhabitants, are preparing for war with the Boers as the alternative of English protection. A chief who is said to be able to bring 3,000 men into the field protected English refugees and loyal Boers during the war, and announced his intention of repelling any attempt to interfere with his guests. When the province is

evacuated by the Government authorities, it is not impossible that English adventurers who will probably have suffered gross injustice may not be too squeamish to direct the unskilled strategy of the natives. The inhabitants of the villages and petty towns will welcome any confederates who may defend them against the violence of the Boers, or who may avenge their wrongs. It is said that in some places both the English and those Boers who had submitted willingly to the annexation are arming for the protection of their lives and property. The Boers are probably more than a match for the dissentients; but they would be grievously embarrassed by a simultaneous native war. The Government, with the rashness which usually accompanies extreme timidity, threw away the opportunity of making reasonable terms of peace, while they could have supported the negotiations by an overwhelming display of force. The only chance of bringing the triumphant insurgents to reason is furnished by the probability of armed resistance on the part of the loyal settlers and of the natives.

Sir HERCULES ROBINSON, who had been detained at Cape Town by the arrangements for peace with the Basutos, has now proceeded to Natal, where the negotiations will commence on his arrival. The difficulty of ascertaining whether the Boers have any representatives with whom a binding settlement can be effected will not be admitted, since the Imperial Government has already made peace with the members of the so-called Triumvirate. It is, perhaps, not surprising that, even if the self-appointed rulers are sincere in their pacific professions, they have not been able to restrain their countrymen from acts of insolent violence. The former Boer Republic had an anarchic organization, and the principal objection of the insurgents to English administration was that it was comparatively regular and energetic. No contradiction is offered to detailed statements of plunder and of forcible expulsion of loyal English subjects. The Ministers at home apparently persuaded themselves that they were negotiating with a homogeneous community, which was nearly unanimous in its wish for independence. They forgot the English; they forgot the well-affected Dutch; and it was perhaps natural that they should overlook the existence of the natives. Every life which is sacrificed in consequence of the precipitate and discreditable peace will be attributable as blood-guiltiness to the Government. If a doubtful report has any foundation, it would seem that the Minister who is primarily, or at least nominally, responsible has repented of the policy which was perhaps forced upon him by superior authority. Lord KIMBERLEY, according to one account, now proposes to substitute responsible government of the modern colonial type for independence. It is scarcely worth while to consider the merits of a policy which will certainly not be accepted by the Boers. Sovereignty over a self-governing colony is an ambiguous title or prerogative, but suzerainty is invented for the express purpose of being absolutely unmeaning. The Boers consider the restoration of the Republic as the promised reward of victory, and they will not be contented with any smaller concession. It is possible that they may calculate too confidently on the patience of the English nation, if not on the indulgence of the English PRIME MINISTER. KRUGER, PRETORIUS, and their associates will be well advised in discouraging outrages on loyal inhabitants, as long as a considerable English force is within reach. They may probably have been inclined to comply with the demand of Sir EVELYN WOOD that the garrison of Potchefstroom shall be reinstated in possession; but Mr. GLADSTONE has since considerably informed them that they must either receive the garrison or make some other reparation. They will not be able to restore to life a certain number of English soldiers who were killed in consequence of the perfidious conduct of the Boer leader; but they may by this time have learned that they cannot overrate the anxiety of the English Government, or of its chief, to terminate the controversy on almost any conditions. Parliament will perhaps be allowed to form and express a judgment on the policy which has been pursued, when its results have become inevitable. The obstinacy of the Boers in the matter of Potchefstroom is rewarded by the indefinite postponement of Sir MICHAEL HICKS-BEACH's motion of censure.

THE LAW OF DISTRESS.

THE present House of Commons is not of Lord Melbourne's mind, that most things are better let alone. It does not require before it legislates to see clearly that the state of things which it proposes to introduce will be at least better than the state of things which it proposes to disturb. There are many questions upon which the action of Parliament will always be decided by the consideration whether it is wiser to abolish a law against which a fair case can be shown, or to retain it until it is proved that a more satisfactory law can be put in its place. Mr. PELL put the facts about distress for rent very clearly when he said that though such a law would not now be enacted for the first time, this was not in itself a sufficient reason for repealing it. Like most laws which are neither entirely wholly good nor wholly bad, it has had some unforeseen results, and the controversy on Tuesday, so far as it was influenced by argument, turned on the issue whether these unforeseen results had made it worth retaining. Very few, however, of the speakers paid much attention to this side of the question. Some of them were too deeply pledged to the tenant-farmers among their constituents to be willing to listen to any plea for delay. For them the law of distress was doomed beforehand. Even with the more independent county members, the fact that the tenant-farmers are for the most part hostile to the law had necessarily considerable weight. They are too important an element in most counties for their opinions not to be taken into account. The members of the late Government lay under a special disadvantage in being the authors of an Act abolishing the Scotch law of hypothec, which differed indeed from the English law of distress in being more stringent, but closely resembled it in principle. When allowance has been made for these several hindrances to full discussion, it will be seen that the debate was not likely to bring out the arguments on either side to much purpose. Perhaps its most interesting feature was the evidence it afforded that the Government have still a good deal of lee-way to make up before their English policy will stand on the same heroic level as their Irish policy. It is singular to find one of the authors of the Disturbance Bill admitting as a matter of course that the landlord ought to have some effective means of recovering possession of his land if he fails to get his rent. Possession of his land was the last thing which Sir WILLIAM HARCOURT was willing in 1880 to give an Irish landlord; but, even in 1881, he still holds that in England land belongs to the owner and not to the tenant. How long he may remain in this benighted state is another matter, but we should be inclined to say no longer than the birth of an English land question.

The one thing that seems to be admitted as regards the law of distress is that it has a tendency to lessen the disadvantage at which a tenant without capital is naturally placed by the side of a tenant with capital. The extent to which it had this tendency, and the benefit to be derived from such a tendency so far as it existed, were much disputed. As to the first point, much probably depends on the character, and something on the circumstances, of the landlord. A man who is neither imprudent nor needy will, under no circumstances, be disposed to let his land to a farmer whom he does not believe to be likely to do justice to the land. He knows, indeed, that the law of distress gives him security against the loss of his rent, and so far makes it a matter of indifference to him whether his tenant is steadily growing richer or is on his way to the Bankruptcy Court. But he knows also that the value of the land does not depend only on the certainty with which the rent can be recovered, and that, in the long run, it is most profitable to have only solvent tenants. Now solvency is not entirely a matter of capital; character has to do with it as well, and the prudent landlord who lets a farm to a tenant without capital does so rather from his knowledge of his character than from his ability to levy a distraint upon his goods. But Mr. COURTNEY pushes this argument too far when he maintains that, if the law of distress is abolished, small farmers will be trusted by their landlords in the future as they have been in the past. As the law stands the landlord is guaranteed against immediate loss if he makes a mistake, and it is impossible to say beforehand how much influence the abolition of this guarantee may exert upon a landlord's conduct. He now says to himself, I must remember, if I let my farm to a man without capital, to make careful inquiries as to his

antecedents, so as to ensure myself in every possible way against being saddled with a tenant who will only do harm to the land during the time that he remains on it. Still, if, after taking all this trouble, I find that I have misjudged my man, I shall not be positively out of pocket by him. The land may be something the worse when he leaves the farm than when he enters upon it; but I shall not suffer any actual money loss. It is quite possible that this last reflection may have an appreciable weight with a landlord. Speculation, when the worst that can happen to you is to make no profits, is a more attractive pursuit than speculation which may end in making a considerable loss. Deterioration of land is diminution of capital, but loss of rent is diminution of income; and, provided that the extent of the former injury is slight, it comes home to a man very much less than the latter. At present, when a landlord is hesitating between a promising tenant without capital and a tenant of whom he perhaps knows nothing beyond the fact that he has capital, his choice may be determined by the recollection that, if he chooses the former and then finds that promise is not performance, the rent at all events will be secure. If this security is taken away, a landlord may be more apt than he is now to say that, after all, capital is a certainty, while character is to some extent a matter of chance.

Supposing, however, that the law of distress does help to put the tenant without capital on a level in the eyes of a landlord with the tenant who has capital, is this process one that ought to be encouraged? We may be glad to see small tenants holding their own by the side of their richer neighbours and bidding against them in the farm market; but are the results of their competition so satisfactory that it is desirable to maintain a law for the express reason that it multiplies cases in which such competition is possible? That is a point which will partly be determined by the circumstances of the landlord. There are needy landlords as well as needy tenants, and it is quite possible that the existence of the law of distress may encourage needy landlords to think of nothing but the amount of rent that is offered them. A tenant without capital may often do more in this way than a tenant with capital. For one thing, he has nothing to put into the land, and so has no return on his investments to allow for. For another thing, he is often more ignorant of his business, and consequently more hopeful of doing well in it, than a tenant with capital would be, and his offer to the landlord may square with his hopes rather than with any well-founded calculations. Again, his want of capital makes it more indispensable to him to have a farm. His only property is his labour, and such rule-of-thumb acquaintance with farming as he may have picked up, and these are not possessions that he can transfer to any other trade. To get a farm, therefore, is a matter of life and death to him—at least, it is the only thing that stands between him and the position of a day labourer. All these things taken together will often dispose a tenant without capital to offer a decidedly larger rent than would be offered by a tenant with capital. If the landlord is not needy, he takes all these circumstances into account, and decides that the risk of having a bad tenant is not compensated by the fact that at the worst the rent can be recovered by distraint. But when the landlord is needy, and his paramount object in managing his land is to draw the largest possible income out of it, he may think—from his own special point of view he may even rightly think—that the risk is worth running. In this case the law acts as a direct encouragement to a class of tenants who do not in any way deserve to be encouraged.

This circumstance alone would account for the dislike which large farmers feel to the law of distress. They look upon it as handicapping them in the race. The inducements which they, and but for the law of distress they alone, could offer to a landlord can now be offered by men who have no capital to invest in the land, and consequently no natural security to offer for the payment of the rent. The law of distress creates an artificial security for this payment, and in this way puts large and small farmers on a level. Their dislike to the law is increased by the difficulty it puts in their way whenever they want to borrow money. In proportion as farming becomes an affair of capital, it becomes also an affair of credit. Even a really well-to-do farmer will at times want to spend more money on the land than he may have at the moment to spend. The law

of distress puts him in a worse position as regards a lender, whether of money or goods, than he would occupy if that law were repealed. The banker who makes him an advance, the implement-maker who lets him have costly agricultural machines on credit, would be prepared to deal with him on more favourable terms if the landlord had no more facilities than other creditors of recovering the debt due to him. As it is, if the farmer fails, the landlord helps himself to his goods, and it is only when his claims are fully discharged that the banker and the implement-maker are allowed to share in the distribution. Undoubtedly this operates as a very serious check upon a farmer's power of getting advances, and the more ambitious and energetic a farmer is, the more this check irritates him. That, as is said by well-informed observers, he is really the better for this check, inasmuch as it prevents him from borrowing more than he would be able to pay, is probably true; but this is one of those services for which no man ever was grateful or ever will be.

THE SMALL-POX EPIDEMIC.

THAT commonplace public which cares little for the susceptibilities of local authorities, and a great deal for the extinction of small-pox, will find itself in unwonted accord with the managers of the Metropolitan Asylums Board. At their meeting on Saturday it was stated that they were doing all they could to urge upon the Local Government Board the necessity of immediate legislation upon the questions raised by the Hampstead Hospital case. Unfortunately, it is extremely uncertain what amount of success their efforts will meet with. No doubt Mr. DONSON is full to overflowing of good intentions. An epidemic in London is the opportunity of the President of the Local Government Board. From that particular office the road to Fame's proud temple is peculiarly hard to climb. It is only once in the course of many years that its chief has the chance of associating his name with a Bill which will set people talking. Ordinarily, he is confined to the dull routine of departmental labour. When he enters the room in which Cabinet Councils are held he is expected to leave his business outside. His colleagues have to settle questions of war or peace, to pacify or coerce Ireland, to consider how Mr. BRADLAUGH may best be smuggled into Parliament. They have no ears for a Minister whose talk is, or should be, of drains, and whose thoughts are less occupied with the redistribution of land than with the supply of water. But, when London is visited with an outbreak of small-pox, even a Cabinet Minister, if he has not been revaccinated, may feel just alarm. It is true that death when he appears in this form is not perfectly equal in his dealings with the rich and with the poor. The one is pretty often taken, the other is usually left. But even this rule is not unfailing, and not even a Liberal politician can be perfectly certain that he himself may not prove an exception to it. In any ordinary Session, therefore, Mr. DONSON would have a very good chance of carrying his Bill. With the state of public business what it is, however, this chance is immeasurably less. There are limits to a Government's power of carrying out its good intentions, and the attitude of the managers of the Metropolitan Asylums Board puts Mr. DONSON in a position of considerable difficulty. If they were prepared to accept the judgment in the Hampstead Hospital case as virtually deciding a question of sanitary policy as well as one of sanitary law, there would be time enough between now and August to carry a Bill through Parliament. But the managers are not in the least prepared to take this view of their duties. They regard themselves as confessors in the cause of Public Health. They are powerless, as one of the managers said last Saturday, "on account of out-door hostility and the abstention of Parliament to do anything to help them." This view of the case entirely ignores the fact that this out-door hostility is directed not against the function of the Asylum Board, but simply against a particular reading of the duties which devolve upon it when discharging this function. From the report of the proceedings at the managers' last meeting it might be supposed that the inhabitants of London were unwilling to admit the existence of small-pox among them, or that they insisted on each case being treated in the patient's own home. It ought not to be necessary to say that this is an entire misrepresentation of the facts. It is only to a particular kind of hospital that objections have

been taken. The contention which underlay the Hampstead case—the contention which, unless the managers take care, may yet underlie a Fulham case—is that no district ought to be burdened with more than its own small-pox patients. If the managers of the Asylums Board had recognized the reasonableness of this view, they might have saved the public some money and some risk. It would have been easy to provide local accommodation for local wants, and the difficulty of isolating patients might have been appreciably less if isolation had involved only a short journey. Unfortunately, the managers refused to believe that there could possibly be two ways of dealing with small-pox patients. They must be brought together in large bodies, in some three or four large hospitals, and the districts in which these hospitals are situated must be made between them to bear the burden of all London. If the legislation which Mr. DONSON is called upon to introduce is to be animated by this spirit, its passage through the House of Commons will be by no means a matter of course. The inhabitants of the districts which it is proposed to convert into receptacles for the small-pox patients of all the districts round will offer as stout an opposition to it as they possibly can; and, weak as they may be by themselves, it is impossible to say how much sympathy their hard case may not evoke. In spite of all that the managers may say, the common-sense view of the matter is that neighbourhood makes all the difference in the world as regards the cure of sufferers from infectious disorders. Those who will readily recognize the duty of caring for disease when it arises at their doors will not be equally well disposed when the disease is intentionally brought to them from a distance.

It is probable, however, that, even if the managers of the Asylums Board had been willing to give effect to this distinction, additional legislation would still have been needed. If the inhabitants of Hampstead would have had an equal right to redress, supposing that the hospital had only contained Hampstead patients, it would have been altogether impossible to deal with such an epidemic as the present; and it is not at all certain that the inhabitants of Hampstead might not have had such a right. It is of the utmost importance, therefore, as regards the successful treatment of the disease, that the Metropolitan Asylums Board should be empowered, in conjunction with the local sanitary authorities, to make proper provision for the reception and isolation of all small-pox cases within the district in which the disease has shown itself. A Bill of this kind, if supported by the managers, might soon become law. A Bill of this kind not supported by the managers, or a Bill of a different kind to which great local opposition would be offered, might meet with very great difficulties. It has been suggested that the controversy between aggregation and multiplication of hospitals might be got over by sending the patients to floating hospitals, made out of old men-of-war, and moored in the lower part of the river. This scheme has the recommendation of combining the advantages of both methods of dealing with the disease. The patients are isolated in a few large hospitals, but no district is made to suffer by having one of these hospitals placed in its midst. Even the objection which is taken to the transport of patients from one part of London to another would be met to a great extent by this plan. In many cases a large part of the journey would be by water, and a very large section of London lies within a short distance of one or other bank of the Thames. Once transferred from the steam-tender to the hospital-ship the small-pox patient would give no further trouble, and in the fresh air of the river his chances of recovery would be as good as possible. If the Admiralty can lay hands on a few disused men-of-war of large size the Government cannot do better than place them at the disposal of the Metropolitan Asylums Board for the purpose of being converted into small-pox hospitals. It is even possible that by this means the need for further legislation may be avoided. Whatever power the managers now possess with regard to the sending of small-pox patients to distant hospitals, they will possess as much when the hospitals are on the water as when they are on the land, while the motives for resisting their use of this power which now exist will then exist no longer.

If vaccination had been properly attended to in the past, there would be no small-pox to attend to in the present, but, judging from the statistics of vaccination in London, the next generation will be no better protected than this one is. The two obstacles which stand in the

way are the fanatical opposition which is excited in some minds by the vaccination of infants, and the absence of any means whatever of compelling the revaccination of adults. For the former obstacle the Local Government Board are to some extent responsible. The objection to vaccination from human lymph is not entirely unfounded; at all events, the paramount authority of Sir THOMAS WATSON can be quoted in support of it. To vaccination from calf lymph there is no such objection, and it is unfortunate that the use of calf lymph should not have received decided and steady encouragement long ago. That vaccination is very unequally enforced, even in different parts of London, is evident from the fact that, of the children born in Shoreditch, 16 per cent. are unvaccinated, while of those born in Whitechapel, only 4 per cent. are unvaccinated. There is no difference in the circumstances of these two parishes that can account for the number of unvaccinated children in the one being four times what it is in the other. It is to be noted that a quarter of the unvaccinated children in Shoreditch were children who had been inmates of the workhouse, if they had not been born there. In other words, they had been actually in the hands of the Guardians, and had been allowed to slip out of them without the law having been enforced. The Shoreditch Guardians have now appointed a second Vaccination Officer, a step which will be useful if a house-to-house visitation is set on foot, as it undoubtedly ought to be. But no amount of additional Vaccination Officers will secure the vaccination of children in the workhouse unless the Guardians are prepared to override the resistance of ignorant mothers who do not wish to have the child made ill for a week at the cost of so much additional trouble to themselves. In cases of this kind nothing but compulsion will have any effect.

YOUNG OXFORD.

AN Oxford Tutor in the current number of *Fraser's Magazine* has undertaken to enlighten the public on "Young Oxford," or in other words on the condition—moral, intellectual, social, and religious—of the present race of Oxford undergraduates. That a good deal of what he tells us is quite true we see no reason to dispute. To readers who happen to have any familiarity with the Oxford of twenty or thirty or forty years ago the first remark naturally suggested by his lucubrations will be that "Cæsar and Pompey are very like each other, more especially Pompey." Certainly, if his account may be accepted, there is a very strong family likeness indeed between the Oxford undergraduates of 1881 and his predecessors of any of the last three or four decades, in spite of all the sweeping changes, academical, religious and other, which during that period have passed over the entire system of the university. It is not for instance any peculiarity of the undergraduate of to-day that he "is likely to err on the side of neglecting religion rather than of positive infidelity," or that he is not invariably distinguished by "a spirit of innate reverence for constituted authority," or that he is "thoroughly Conservative in many points" and particularly in resisting all disciplinary innovations. Nor is it any specialty of modern Oxford that the university itself, and every college in it, is split up into various sets which have little common ground of agreement, and that "Christ-church is the resort of the young aristocracy who seem to consider the getting up of periodical rows an essential part of their education." There would seem to be a remarkable continuity even in the relative position and character of different colleges. We are told for instance that Balliol, New College, and Corpus still retain their scholastic pre-eminence, and our Tutor sees every reason to suppose that they will continue to do so. In one respect there is no doubt a change, and a change for the better, from the Oxford of half a century ago, though it has been in progress now for many years past, and finds an analogy in the altered and more friendly relations of boys and masters at our public schools. It may perhaps be questioned whether "more lasting friendships are often formed in Oxford between College fellows and undergraduates than among undergraduates themselves," but at all events the old tradition of looking on every don as a natural enemy and every college regulation as "simply made to spite me" has long since died out. There are still, according to our informant, a very few "dried up and crusty dons," who seem to resent the very existence of undergraduates, just as the sentiment used some years ago to be attributed to a well-known head that the final cause of undergraduates was to walk about the grass-plot in Quad and make themselves generally objectionable. Another nascent innovation recorded by the Tutor is by no means equally commendable. After telling us that it is entirely against undergraduate etiquette to settle a quarrel by an appeal to force instead of by a temporary or permanent process of cutting, he adds that this etiquette is sometimes set aside, and "quite lately have been fought two sham duels."

It appears that the American whose criticisms have called

forth the Oxford Tutor in vindication of his *Alma Mater* had declared that there is no intellectual life there among undergraduates apart from the schools, while somebody else has brought the opposite charge that the superabundant philosophy they are crammed with is apt to find its vent in Agnosticism. The first charge is manifestly an absurd exaggeration, "based," as the Tutor rather grandiloquently words it, "on very insufficient premises." Unless Oxford has changed remarkably in a very few years, there is a distinct tendency to disregard the schools altogether in the matter of intellectual life. As to the second, there will always no doubt be more or less of scepticism prevalent wherever a number of educated young men are congregated, and Oxford has proved no exception to the rule. The writer reminds us how Aristotle has observed that "young men, having but little experience, and being liable to be led astray by their passions, are not fitting students of moral philosophy;" and he might have cited further the caution addressed by the head of a distinguished College at Cambridge to his fellows in conclave assembled, "We must remember, gentlemen, that we are not infallible, not even the youngest of us." A commentator on recent Oxford history in the *Church Quarterly*, who goes a good deal more deeply into the subject than our gossiping tutor, forms rather a gloomy estimate of the religious prospect, in view of the clean sweep that has been made, or is being made, by modern legislation of almost every vestige of the old ecclesiastical safeguards and restrictions, whether collegiate or academical. But he admits that there are still important practical religious influences at work, and notes some encouraging features in the religious side of Oxford life. A somewhat angry correspondence which has been going on in the *Non-conformist* brings testimony from an unexpected and unsuspecting quarter that as yet the Church has gained more than it lost from coming into close contact there with her rivals on equal terms. Meanwhile, as was observed before, practical irreligion is pretty sure at a place like Oxford to be a more pressing danger than speculative unbelief, and we may hope the Tutor is justified in assuring us that, even in sceptical circles, the presence of a single man reputed to be pious, or of a boy fresh from school, puts a restraint on all sorts of doubtful conversation. In this matter probably the standard of "good form" and "shocking bad form," on which he dwells, would be held to apply, though it is no doubt true that at Oxford as elsewhere, "sundry things, drunkenness for instance, are allowed to pass muster, which a higher moral standard would condemn." Cigarettes and tea, however, rather than alcoholic liquors, are the special temptation of the present generation. Another phrase which he represents as being a potent instrument of social ostracism reminds us in its meaning of a term of hardly less questionable English much in vogue at Oxford some years ago, where it was especially, and often of course most unfairly, applied to new comers from Rugby, who were supposed to be "terribly in earnest" and to cherish by no means defective appreciation of their own capacities. Such men were called "pruff" in those days; now, it appears, they are said to "put on side," but the term is sufficiently vague to be a formidable weapon of offence against any one held to be "unclubbable."

It may be generally described as a combination of outward swagger and inward conceit; but the suspicion of "putting on side"—in Oxford, at all events—attaches itself to various individuals on most contradictory grounds. One man is supposed to "put on side" because he happens to be shy or reserved, and consequently talks less than his neighbours in general society. Another is held to talk too much, and so to "put on side;" and there are men who have laboured under the same imputation simply because they happen to walk in a less crab-like fashion than their fellow-creatures. "Side," where it does exist, is certainly an objectionable feature of character; but at Oxford, in nine presumed cases out of ten, we believe its existence to be purely imaginary.

The Tutor has a good deal to say, but not much which is not generally known, about Clubs at Oxford, beginning, of course, with the Union. But here, while he informs us, with discreet reserve, that "it has a history," he omits to give any intimation of how long its history has lasted, or to say that it kept its Jubilee eight years ago, although he repeats the threadbare story, which was reproduced in one of the speeches made on that occasion, about Mr. Lowe, as President of the Union, fining the present Archbishop of Canterbury a sovereign for disorderly behaviour. We are told again that the oldest of the Oxford convivial Clubs is the Phoenix, and that its records date back to the last century, and that very quaint legends are connected with it. We are not told that it went at that time under the more questionable name of the "Hell-fire Club," and that the "quaint legend" for which it is chiefly famous is the story of the Evil One appearing in person to carry off a drunken and blaspheming undergraduate from a supper party at Brasenose, which a fellow of that College, lately deceased, was popularly supposed to have witnessed as he passed along Brasenose Lane. It is fair to say that the Phoenix for some years has steadily disowned descent from the "Hell-fire Club." We need not follow the Tutor through his detailed report of "the amusements of Young Oxford," which are much the same as may be found *mutatis mutandis* at every English university or public school. Perhaps, however, much as some of the present Clubs would have shocked a Don of the last generation, it is not wholly irrational that a young man who has accidentally missed "Hall" should be able to dine without the certainty, if caught in the fact, of a Proctorial fine. Still less is it necessary to transcribe the author's summary of the existing regulations about the schools, which may always be found recorded in the *Oxford Calendar* for the current year. He evidently supposes that he has made a notable discovery, when he tells us, with much

solemnity, that "it cannot be held that it is in the way of schools alone that Alma Mater educates her foster-sons. Men acquire a species of education by contact with each other," with much more to the same effect, finally enforced by a long quotation from the Funeral Oration of Pericles. We need scarcely say that the idea thus elaborately paraded is one of the veriest commonplace of all educational literature, as regards both our universities and public schools. Its rationale is expounded with his accustomed grace and felicity in Cardinal Newman's University Lectures, but in itself it is familiar to every one who has the slightest practical acquaintance with the subject, and it is difficult to read without a smile the pompous announcement—as though of some grand discovery which it was reserved for an Oxford Tutor to flash upon the world in the pages of *Fraser* in the year of grace 1881—that "man is essentially an imitative being, and this is more especially true of young men." Perhaps we might venture to suggest as a corresponding verity that Tutors are essentially didactic beings, and this is more especially true of young tutors. It is easy enough, when one has once got into the vein, to pass from one truism to another. It is not wonderful therefore that, after filling several pages with a kind of glorified paraphrase of the *Oxford Calendar* and *Undergraduate's Journal*, and then elaborately discussing whether it is true that men at Oxford got some sort of mutual education from contact with each other, the Tutor should finally proceed to inquire—in a somewhat hesitating and tentative fashion, as though doubtful about the reply—whether they enjoy their Oxford residence at the time, and retain a pleasant memory of it afterwards. To most men—at least most Oxford men—the inquiry might perhaps appear rather a work of supererogation; as the Germans would phrase it, "that understands itself." But our Tutor goes to work systematically, and after balancing the pros and cons in due order arrives at last at the modified and not over confident conclusion that on the whole "few men, as they bid farewell to Oxford, as Magdalen Tower, St. Mary's, and Carfax [is there not rather a bathos about Carfax?] one by one fade in the distance [Oxford readers will note the nice topographical accuracy of the catalogue] are entirely devoid of some feeling of lingering regret." The statement is at least unimpeachably cautious and temperate. Byron had remarked long ago that

On leaving even the most unpleasant people
And places, one keeps looking at the stoop.

And that is really the utmost our sage informant thinks he "can safely say" of the feeling of an Oxonian bidding final adieu to his old home after three or four years' residence at the most impressionable period of his life. Our own recollections and experiences might perhaps have inclined us to a somewhat more enthusiastic estimate. But it is well to be on the safe side. Let us hope that when the time shall come for the Oxford Tutor himself to take his last look at "Magdalen, St. Mary, and Carfax, one by one," in sad succession, and bury himself in "the dusky purlieus of the law" or in the obscurity of a rural vicarage, he too will be able to rise for the nonce to "a feeling of lingering regret"; but we may also venture to hope that he will confine that generous sentiment to his own bosom, and not suffer it to expatiate in another article in *Fraser*; *salus una superque*. He has himself assured us, in his grave and sententious manner, that "the lesson of self-control is taught by the etiquette of Oxford society." Let him therefore apply that valuable lesson to his literary aspirations, and pause to consider, before he again comes forward to instruct the general public, whether he has anything to tell them which they did not know before. When Dr. Arnold first took charge of the Sixth Form at Rugby he resolved, according to his biographer, to innovate on the established practice of setting themes on the subject of *Virtus est bona res*. If our Tutor had not implied that he belongs to the younger generation, we might almost have suspected him of being trained at Rugby under the old régime.

THE INNOCENTS IN IRELAND.

THE two most guileless persons among Her Majesty's subjects of whom documentary evidence gives us any cognizance are, almost without a doubt, Mr. Shaw-Lefevre, M.P., and the editor of the *Freeman's Journal*. It is not quite easy to decide whether there is anything to choose between them. Mr. Shaw-Lefevre, more in sorrow than in anger, expostulating with Mr. W. H. Smith for even hinting that the Government found their account in encouraging Irish agitation; the *Freeman's Journal* plaintively asking what it is all about, why Dublin is proclaimed, why Mr. Dillon is arrested, are two pleasant sights. With Mr. Shaw-Lefevre we shall not greatly trouble ourselves. It would only be possible to show him why Mr. Smith and other sensible people think the Government to have been interested in the disturbances and outrages in Ireland by the aid of logic. Now logic, like political economy, is for the present taboo to Mr. Gladstone's immediate followers. It is good for Saturn-and-Jupiter-fellows, not for practical politicians. The *Freeman's Journal* offers metal more attractive than the member for Reading. The *Freeman's Journal*, greatly pondering, is disposed to attribute the proclamation and the arrest to the fact that "the outrage-mongers have again been at work." The outrage-mongers certainly have been at work, with a vengeance, and it may be profitable, if not pleasant, to consider their proceedings. It cannot be too constantly borne in mind what sort of folk Mr. Gladstone's clients are, and what kind of

deeds are to be rewarded by the carving of neat competences for their perpetrators out of the property of the landlords.

The achievements of the outrage-mongers during the last week or ten days amount, speaking generally, to one murder, two attempted, and possibly still to be completed ditto, one roasting, one ear-clipping, several firings into houses, and miscellaneous attacks on persons or property, including the ripping-up of a cart-horse or two, too many to mention; besides Mr. Dillon's speeches and the mobbing of the Emergency Committee representatives at Howth and elsewhere. The details of the various exploits are very curious and delightful, calculated to "stir the national conscience"—we believe that is the correct phrase—more than ever to do justice to the finest peasantry on this or any other planet, including Saturn and Jupiter. The roasting has been denied; but the practice has been a favourite one in times past, and Erin is quite likely to remember the days of old in this way. The ear-clipping has been exaggerated, says Mr. Forster, but he does not deny its truth. It is not particularly easy to understand what exaggeration of such a matter means; either the bailiff's ears are on his head or they are not, unless perhaps some stumps may be left. Perhaps in the latter case the Government regards the proceeding as a fair apportionment of the property between Mr. Dennohy and the Land League, not dissimilar to their own intended division of Ireland between landlords and tenants. The wreckings of houses, the firings into them, and so forth, are quite familiar and rather stale. But the murder is a very instructive murder indeed. We are not now referring to the Fenian outrage in Dublin, but to the affair in Connemara. The victim was a cattle-herd, and it is especially noteworthy that the farm on which he served had not been "landgrabbed" by any one, neither had any one been ejected from it. It was land which had for many years been in the occupation of the owner, and which previous to that occupation had been voluntarily surrendered to him by a perfectly responsible and independent tenant. Yet the caretaker and his son were dragged out of bed and shot in the road—the father being killed, the son mortally wounded. This was a testimony on the part of the Land League against herds. The import of this ought to be very carefully studied. Grass farms are, it is well known, the most profitable employment of land in Ireland, and the land is better suited for them than for any other purpose. But as they do not suit penniless peasants, and interfere with the growth of a ragged population always open to the influence of the agitator, they are forbidden *per se*. There is here no question of the crowbar brigade, no insinuation of any hardship inflicted on any living soul. The Land League has decided against any form of cultivation but such as it prefers, and the decision is enforced in a business-like and peremptory manner which, unfortunately, the Executive of the less powerful of the two Irish Governments does not imitate. It is noteworthy that the conscience-of-the-nation party have been very discreetly silent about this particular crime. Here at least is something which not merely no Land Bill such as the present, but nothing short of an agrarian law limiting holdings to, say five acres apiece, and prescribing their culture, can touch. The utter madness of supposing that any Land Bill in the direction of the earlier clauses of the present will cut away the root of the evil is demonstrated by this death of the unhappy man Lyden in a fashion which admits of no explaining away.

The speeches which at last goaded the Government into doing what ought to have been done a year ago, and laying Mr. Dillon by the heels, and the incident which no doubt partly led to the proclamation of Dublin, are almost equally instructive, and fortunately the lesson is not enforced by the death of an innocent man. The riot at the Howth sale is an admirable exposure of the state into which Government mismanagement, and nothing but Government mismanagement, has allowed the second city of the Empire, in point of political importance, to get. A tenant (of ample means, and who is not even pretended to be one of those objects of Mr. Gladstone's compassion, who can do nothing but rent from a brutal landlord the land which that monopolist withholds from them, save at an exorbitant price) refuses to pay his rent out of sheer wantonness. His cattle are distrained upon, and having been bought by fair bidders in the open market, the rent is paid. Thereupon a procession of howling roughs accompanies the beasts and the new owners into the city, hooting and hustling them, pelting them with dirt, and doing all that is possible to prevent the beasts from being shipped. Here, again, there is no possible imputation of personal hardship. The arbitrary dictates of an irresponsible association are enforced by a mob; and comparatively moderate partisans of that association ask with astonishment why precautions should be taken to make such things a little more difficult, or rather more dangerous, in future?

Perhaps the most interesting thing, however, of all is the speech which at last broke the back of Mr. Forster's patience in the matter of "John Dillon." That energetic person had already, in a phrase of his own, "sailed very near the wind" by telling the now famous story of the men with loaded rifles who lay in wait inside a house at which an eviction was threatened. On Sunday last he achieved the nautical manœuvre known as sailing, not merely near the wind, but a point the other side of it. It is noteworthy that Mr. Dillon does not condescend to make the least reference to the Land Bill. That panacea is for him simply *non avensu*. If his hearers would go on as they were going for two or three years, said he, they would and by handing over the soil of Ireland to the men who tilled

It. If they could resist, on the whole successfully, the exactions of the landlords till the autumn, the game was won. And then Mr. Dillon proceeded to explain the proper *modus operandi* for holding out till the autumn. In the first place, the levying of rack-rent was to be obstructed by every means ingenuity could suggest; in the second, every man, whatever his profession, who assisted that levying was to be "punished," to be "attacked," to be "followed at every turn of his life." Of course Mr. Dillon suggests that all this may be done within the law, though how things in themselves illegal are to be done within the law is not so clear. Equally, of course, his hearers took his test without his qualification. The Land League method of "punishment," of "attack," of "following," is murder, as in the case of Lyden; mutilation, as in the case of Dennehy; torture, as in the case of King; damage to property, combined with cruelty to animals, as in the case of the cart-horses ripped up the other day because their owners dared to lend them to the Constabulary. This is the simple plan by which the executive of the Land League obey Mr. Dillon's beautiful exhortation to "carry the conviction of their power into the hearts of their enemies." A charge of shot ought certainly to carry conviction. Knives and fire have at all times been favourite arguments with certain brutal and savage natures, and "Hate me, rip up my horse," is at least as logical as "Love me, love my dog."

To all this we shall of course hear, and indeed have heard, the old stereotyped answer. The Land Bill is to take the heart of stone out of the Irish peasant, and to give him a heart of flesh. The conviction of Mr. Gladstone's goodness, the delightful labours of the litigation of the Land Court, will soften his manners, and not permit him to be fierce. The chance of a fresh haul at his landlord's pocket every fifteen years will keep him quietly expectant in the intervals, when, indeed, he will be digesting haul the last. It is difficult to argue on such a point as this, because (it is unpleasant to have to say it) it is impossible to believe in the *bona fides* of the antagonist, or, accepting his *bona fides*, to admit his competence. Obviously Mr. Gladstone's Bill will do none of the things for the want of which the Irish peasant now murders and mutilates and tortures. It does not even profess to enact that no owner who holds grass land in his own occupation shall go on holding it. It does not even pretend to hand over the soil to the tiller. Its provisions forbid all the most dearly cherished misdoings of the tenant—subdivision, subletting, dilapidation, perhaps, even, though there seems to be a doubt about this, the beloved system of conacre. Mr. Gladstone himself declares that the changes asked for by the Irish Roman Catholic Bishops who, it need hardly be said, are far behind Mr. Dillon and the extreme Land Leaguers, would "give the Bill a new character." It is impossible, therefore, that the cause of these outrages should be removed by the Bill, even if it passed Lords and Commons by acclamation in the present week. Let it be granted to its fervent panegyrists that it is a great act of justice, a noble display of conscience, and all the rest of it. It is still not what Mr. Dillon and his likes are agitating for, and therefore there is nothing to prevent Mr. Dillon and his likes from continuing or renewing their agitation. All this is as clear as the sun at noonday, yet it seems to need repetition. Liberal members of Parliament are being daily begged, exhorted, threatened, that so they may vote for the Bill, the whole Bill, and nothing but the Bill. At the bottom of all these prayers, arguments, menaces, lies the contention that the Bill will stop agitation. Now it is perfectly certain, and more certain from the words of Mr. Dillon and the events of the last few days than from anything else, that it will do nothing of the kind. If the Bill had been law a month ago, it would not have forbidden Lyden to herd Mr. Graham's cattle; it would not have saved Butterly's cows from being sold; it would not have prevented, as far as can be seen, one single act by which, according to the sympathizers with outrage, that outrage has been provoked. Unless the recovery of rent by any means whatever is to be made impossible, and the following of any method of cultivation discouraged by the Land League forbidden, things will be just as they were, or worse. For a man who is promised a loose shoe is naturally all the more impatient of a tight one. So the murders, the roastings, the ear-clippings, the horse-stabbings, the mobbings of last week will go on merrily, and the conscience of the nation will be aroused again, and another slice will be taken out of the landlords' pockets, and so, *ad caput*, until there is none left. Obstinate questioners may possibly ask, What then?

ORATORS AND CRITICS.

THE speeches at the dinner of the Royal Academy were, perhaps, more remarkable for number than for merit, or for any light which they threw on the prospects of Art in this country. No one can expect to get many new and stimulating ideas from speakers who are almost obliged to use the language of rosy optimism. It would be absurd to suppose that the majority of distinguished persons who "rallied round" Sir Frederick Leighton cared much more for Art than for Literature, or Consumptive Bellows-makers, or Fishmongers, or any other persons and institutions that are the occasion of big public dinners. Novel utterances are often made at this feast, and Mr. Gladstone, as we shall see, came out with a very novel theory this year; but people are not bound to be startling at a dinner of the

Royal Academy. It is not like a meeting of the British Association, when the President used to be expected to start an entirely unheard-of theory of the beginning of life on our planet. Sir Frederick Leighton did his duty with industry, grace, and perseverance. "There shall never be a forlorn hope without you" is the promise his colonel gives Claude Melnotte in the *Lady of Lyons*. There was no forlorn hope without the President at the Academy dinner. Nine times, if we have correctly counted them, he marched into the breach. His remarks were usually poetical, and he used one especially pretty figure, about "a little realm controlling a vast empire, along the wide skirts of which war, ever smouldering, leaps fitfully and too often into flame." Both the host and the guests paid many sincere compliments of regret to the memory of Lord Beaconsfield. Mr. Gladstone did not indeed seize the occasion to avow that he had always regarded his late rival as his heart's best brother. He confined himself to the perfectly safe remark that Lord Beaconsfield was "an extraordinary man" and his life "an extraordinary life." And he could not but rejoice that the extraordinary man had been painted by Mr. Millais. That was all. But, if Mr. Gladstone was less than effusive about this matter, he made up for it by one of the richest and rarest economical discoveries which is associated with a name distinguished in finance. "The English school," he said, "is comparatively little in the eyes or recollections of the great civilized nations in Europe." And why? Because we are a very wealthy nation, and can afford to keep our pictures at home, despite the frantic bids of the civilized, but indigent, nations of Europe. The Italians, on the other hand, though most wealthy in works of art, have been notoriously poor, even in paper money. Consequently they sell their pictures, and so increase their artistic reputation abroad; while we keep our performances jealously at home—except Mr. Alma-Tadema's "Sappho," which is going to America. Mr. Gladstone actually said, "Had we been a poor country like Italy, and produced all the works of art we have done, the fame of British art would have been more widely extended, and made familiar to the ears of Europe. It is, then, owing to the power of England to keep the works of her artists at home that her artists have not taken that place they would otherwise have taken in the general estimation of the world." This is a beautiful theory, which we could hold with more confidence if there were more signs of the anxiety of the foreigner to bid; if, so to speak, he kept looking wistfully through the shop-windows at the gorgeous treasures which are "not for him, nor the likes of him." In another way, Mr. Gladstone's application of political economy to art is encouraging, not to say exhilarating. People who understand about these matters say that, as a nation, we are rapidly growing no richer. Agricultural depression and the decay of trade are undeniable facts. Never mind. As our financial credit declines, our reputation for art is bound to soar; and, when we cannot pay our artists their prices, France will begin to bid, "Russia will step in with her tallows," Spain will enter the market, and the works of Mr. Frith, and of Mr. Solomon Hart, will hold their proper place, at last, in the estimation of Europe. Such are the uses of adversity, and it is by stepping-stones of national poverty that our artists will climb the pinnacle of fame.

Literature is rather in the shade at present; but even the existence of literature was recognized at the Academy dinner. Out of two hundred and fifty guests, no fewer than eight were men of letters. This is as it should be. Art and Literature are sisters, and have commonly flourished together; therefore Art, on her gaudy day, does not forget her poor unsuccessful relation, but offers her more than the crumbs which fall from her opulent table. No fewer than eight "literary chaps" were bidden, we repeat, to the dinner of the Academy. The messenger of Art reached Mr. Matthew Arnold in that garret above the tripe-shop in Grub Street where he used to smoke with dear old Arminius. Mr. Robert Browning was also there, "among the swells," as George Warrington said. There was also Canon Farrar, the author of a sweetly pictorial *Life of Christ*; and though no other members of the staff of the *Daily Telegraph* were there, yet the *Times* reporter was present, and Canon Stubbs, and Mr. Burnand, and Lord Houghton, and Mr. Bret Harte. Mr. Matthew Arnold was called to return thanks for this large and representative selection of men of letters. And yet Mr. Arnold did not seem happy. "Men of culture," says a contemporary tragedian, "are never happy," but the occasion, the novelty and splendour of it, the lusciousness and abundance of the repast, might have been expected to bring a smile even to the lips of the mourner for Arminius. It is true that Mr. Arnold's speech was cut out by the reporter of the *Observer*, who (very naturally) did not think literature deserved much notice when princes and premiers were going about. But Mr. Arnold, though a *sacer vates*, can hardly have foreseen the supercilious conduct of the *Observer*. Perhaps he was crushed by the novelty of the opportunity; for it is usual, on occasions of this sort, to have Literature represented by a prosperous journalist of the Americanized kind. However it happened, the strayed reveller was gloomy. He said that Literature had lost her old place and power. Men of letters were, if anything, ornamental rather than useful, "facultative, not obligatory." "Sir William Grove and Science are obligatory; it is I and Literature who are facultative." No fellow likes being facultative when he comes to think of it—though perhaps Mr. Arnold is the first man of letters who ever did think of it in these peculiar terms. But he consoled himself by fancying that Art "is in the same boat." We only wish Literature were in the same boat, nay, the same gilded barge, as

Art. Then Mr. Arnold scathed "the swells" with his wonder "what could have induced you to import among them such an inutility as a poor man of letters." He seems to have fancied that the six or seven men of letters should have dined, like Dr. Johnson, behind the screen. He appeared as the slave at the Roman triumph, and whispered to the President, that he, too, was mortal, that his "experience and career" were remote from those of Rank's gilded children. He spoke pathetically of "our struggle," the fierce struggle for bread in which poets and painters are ferociously engaged. "What do they know" of all sorts of uncomfortable things, and of "mighty poets in their misery dead"? Mighty poets do not seem so very badly off in this quarter of the nineteenth century. Having thus uttered the thing that was in him, and the message of the proletariat, Mr. Arnold gave place to the Lord Mayor. Did the Academy think what it was doing, when it took the siege perilous, so to speak, and asked Lord Mayors and Premiers together? It was tempting Fenianism and revelling over dynamite. The Lord Mayor was rather amusing about Blackfriars Bridge and Art in the City. But the company could not get rid of the gloomy impression left by Mr. Arnold, and probably many of the great dreamed that night of Mr. Arnold, Mr. Frederic Harrison, and the private guillotine which, according to the former playful writer, the latter keeps in his back-garden.

Critics, of course, have by this time had their say about Art, like the orators. They have written exactly what was expected of them. The terrible "Dreum of the Academy," published a fortnight ago in these columns, has been fulfilled. The comic 'Arry critic has made the very puns about "Idyl," and "idle," and about shepherds' pipes and tobacco pipes, which our dreamer heard him utter. Another critic has felt, as usual, that it is really impossible for him to write about the pictures of the year, and has confined himself to some prolonged remarks on the early training of Millet. Perhaps he will reach Mr. Millais and Mr. Alma-Tadema in August, if he struggles very hard. The critic who is so fond of Lemprière and of the history of the last century has had plenty to say about the "Sappho" Mr. Alma-Tadema did not paint, and about Suffolk Punches, Candahar, and kindred topics. The critic who is so fond of strange adjectives has invested freely in a delightful new word, "coloration." The critic who knows all about folk-lore has chiefly confined his remarks about the Academy to a treatise on the story of Cinderella. The critic who is such a great man that nothing pleases him has called everything "flaccid" which is not "fantastic." And the moral critic is writing a tract on what he believes to be the conversion and repentance of Mr. Burne Jones, with an essay on "Backsliding Brethren," suggested by Mr. Allingham's portrait of Mr. Carlyle, with blue china plates fastened on the walls of his room.

WRONG-HEADED REFORM.

THE work of improving our army goes gaily on. To say that it resembles the labours of Sisyphus is to give but an inadequate idea of its magnitude. He, at any rate, had the mournful satisfaction of getting his stone nearly to the top of the hill; but we never seem to get our dead weight of military reform even half way up before it comes down with a run, and leaves us in blank despair. It is not easy to fix the precise period at which this reforming mania commenced, but he would be a bold man who would venture to predict where it will end, for the simple reason that we appear to progress in the well-known Hibernian ratio of two steps backward to one forward. We have been engaged for years past in rewinding pieces of new cloth on to a very ancient garment, and then in wondering that the rents become wider and wider. And the best of it is, that the greater part of all this patching has been unnecessary, or at most the necessity for it has been self-imposed. From the day when, in imitation of a foreign Power, we discovered that we too ought to have a Reserve, we have been engaged in a fruitless struggle to make one man do the work of two; or, to put it more correctly, to make one boy do the work of two men. At the period just mentioned the situation was this—by enlisting men for twelve years, the whole of which was spent with the colours, and by further prolonging this period to twenty-one years with about one-third of the men who had completed the first period, we were just able to satisfy the ordinary military requirements of our Empire. True, we had no reserve for a European war or for any great emergency; but our daily needs in the shape of ever-recurring little wars were pressing, and we had in fact to decide the following question—Should we continue as we were, that is, taking the full value out of our recruit when once caught, by keeping him in any case for twelve and sometimes for twenty-one years; or should we dismiss him at the end of six years into a Reserve which might or might not be wanted, trusting to chance to meet the extra demand which such a step would cause upon our recruiting powers? In an evil hour we chose the latter, and we have never since had a moment's peace or respite from the trouble in which this decision has plunged us. The worst of it is, that nothing will induce us to look the question fairly in the face. That question we maintain is this. Our recruit-producing power is limited and constant; our military requirements are large and constant. We must, therefore, do one of two things—satisfy the present, and leave the future to chance, or make sure of the future in the shape of a Reserve and leave the present to chance in the shape of insufficient numbers of untrained men or rather boys. Having

then decided to take care of the future, we are now grumbling because we cannot satisfy the present as well; in plain English, given a decidedly small piece of cake, we are surprised and indignant because we cannot both eat it and have it. As year by year passes, and we see how little our Reserve has done, we turn our eyes to our active army, and then we see how little it, too, has done. Neither, in fact, has been of much service, and an uneasy feeling is beginning to prevail that we have made a grand mistake, but we have not the courage to own it. When an incident like the Candahar march occurs—an incident which ought to and would open the eyes of any but the wilfully blind—and when that incident is further supported and its moral strengthened by the deplorable failures in the Transvaal, we partially awaken to the real truth, but only for a moment. A few sentences of pretentious dogmatism, a few sneers at old-fashioned notions and ideas, are sufficient to shame us into silence; and once more we go drifting on, sacrificing alike the splendid history of our army in the past and its efficiency in the present for the sake of a future which may never come. On a former occasion we made use of these words when discussing the question of the new organization of our regiments:—"We want a certain number of recruits annually; if we can get them, the present system, or, for that matter, any other system, will do well enough; if we cannot get them, no amount of manipulation, organization, reform, or by whatever other name it may be called, will enable one man to do the work of two, or to be in two places at once." This, we maintain, is the real point, and we refuse to allow ourselves to be diverted from it. But, as we have already observed, nothing will induce the nation at large to face it. We double round it, we evade it, we temporize with it, we procrastinate, we extol our Militia, we glorify our Volunteers—we do anything and everything except recognize the fact that our regular army is neither numerous enough nor seasoned enough for the work it has to do. The ingenuity which we exercise in fencing with the question is simply astounding. There is no limit to the amount of public time and public money which we are willing to devote to what is called Army Reform, provided only the one thing needful is left undone. One makeshift after another is tried, the invariable result being that each so-called improvement leaves us, if anything, further and further from the desired end. For instance, upon one occasion when the state of our army was more than usually unsatisfactory, and the nation at large was ready for some effectual change, we abolished purchase among the officers, and having thus satisfied ourselves that we had thereby provided an ample supply of recruits, we calmly went to sleep again for awhile. On another occasion we established short service and a Reserve, on another we tried linking our battalions in pairs, on another we administered a dose of public money in the shape of twopence per diem extra pay, on another we gave the soldier his ration of bread and meat free of charge, and now we are going to link regulars and Militia and abolish our old numerical titles. We have also reformed the soldier's dress, his barracks, his food, his treatment, and we have reformed his discipline to an extent that will shortly leave none at all. All this and much more have we done; but the one vital question of how to provide a sufficiency of trained and seasoned soldiers for our ever-present needs we carefully ignore. We are far from saying that these reforms were unnecessary or superfluous; on the contrary, many of them, notably those which affected the personal welfare of the soldier, were good and useful measures. Even the larger schemes were at least plausible; for purchase was admitted to be morally indefensible; the local connexion which the brigade depot system aimed at was certainly desirable, if it could be only achieved; while the formation of a strong Reserve, if it weakened the active army, gave the country a certain feeling of security. It is the very plausibility of these measures which has been their most dangerous feature, inasmuch as they have only served to distract public attention from more important issues.

At the present moment we are threatened with a fresh reform, and one which, though somewhat novel in its character, is in the main of a nature precisely similar to those just mentioned. Sundry articles and letters have recently appeared in the *Times* advocating an improvement in the shooting of our infantry. It has been urged that, because our men were defeated on every occasion in the Transvaal, their bad shooting was the cause of the disasters, and accordingly we are recommended to brush up this particular branch of our military instruction. Now, we have already given our approval of any reform that may be attempted in this direction. If the shooting of our men is distinctly deficient, by all means let it be looked to. But what we wish to insist upon is this—namely, that it ought to be clearly demonstrated that our defeats were solely due to bad shooting, and to nothing else. In a word, was our failure in the Transvaal a purely musketry failure, or was it a military failure? The answer, in our opinion, is clear, namely, that while fully admitting the superior individual shooting of the Boers, our defeats were not wholly attributable to the bad shooting of our men. We are not quite prepared to allow that because the Boers have proved themselves to be among the best marksmen in the world, we are among the worst. Let us look at matters a little more in detail. Our first defeat was at Laing's Nek, where we were on the offensive; and it was admitted at the time that, despite the advantage which the Boers enjoyed from their defensive position, our attack would undoubtedly have succeeded had we only provided proper supports at the critical moment. Next we had the affair on the Ingogo, where a number of our men with two guns made targets of themselves on an open plateau for the fire of concealed skirmishers. Last, and worst of all, we have

the affair on the Majuba Hill, where we were on the defensive. Can any unprejudiced, impartial person read the account of that action as given by the Special Correspondent of the *Standard*, and then say that our defeat was solely due to bad shooting? We maintain that our defeats were due mainly to defective tactics, want of discipline, and the absence of that feeling of confidence, that perfect reliance of comrade upon comrade, which was once the prevailing characteristic of our soldiers. The British soldier of the past was not in the habit of being pushed by his officers into action, as described by the authority just quoted, he was not in the habit of turning tail and running back from the comrades he had just come to reinforce. Throughout the whole of that miserable affair the sole redeeming feature was afforded by the old soldiers, who stood and behaved as old soldiers who know and trust each other always do. We are quite aware that a considerable amount of capital has lately been made out of the fact that a large proportion of our men who fought at Quatre Bras and Waterloo were young soldiers. Granted that it was so; but it should be remembered that there were many old men in the ranks, and also that the discipline of those days was very different from what it is now. That the Boers are better shots than our men is unquestionable—they are probably as a race the best shots in the world, and no regular soldiers, from whatever country they might be chosen, could hope to compare with them. Our tactics should, therefore, have been directed to neutralizing, as far as possible, this superiority, which was precisely what we did not do. On the contrary, we afforded them every opportunity of utilizing it to the utmost, and, having failed in tactics, in discipline, in steadiness, in almost every good quality for which the British infantry soldier was once conspicuous, we throw the whole blame on our rifle practice, which is in reality only responsible for a certain portion of it. Let us be honest and apportion the blame properly. Let us recognize the fact that the young, half-trained, and almost wholly undisciplined soldier is a mistake, and a very serious one too. If we persist in wilfully shutting our eyes to this patent fact, our next war will simply be a repetition on a larger scale of our recent disasters. By all means, as we have already contended, let us improve the shooting of our men, and do away with the present ludicrous restrictions on its efficiency.

THE HIGHEST CRITICISM.

THERE are few more pleasant sights than the spectacle of important youth laying down the law to an obedient and breathless world, and this spectacle has seldom been presented more pleasantly than in an article signed William H. Hardinge, in the current number of the *Nineteenth Century*, on "French Verse in English." When we took up the number we confess ourselves to have been totally ignorant of Mr. Hardinge's name. But it seems from his paper that he has published some translations, especially from Nadaud, and it is nearly certain that he must possess the blessed quality of youth. He has set himself to show that translators of French verse into English are, as a rule, and backsliders. Their "selfishness" and their "want of care" have, it would seem, marred Mr. Hardinge's youth by giving him occasion for many tears. Their "demerits are of so glaring and detrimental a nature" that they cannot be "lightly passed over." They "deadens the colour" of their originals and "spoil their singing." They are "saint-hearted and metricaly inaccurate." Especially does Mr. Hardinge fall foul of Mr. Andrew Lang's *Ballads and Lyrics of Old France*. Mr. Lang is a person quite capable of defending himself, and we have not the least intention of taking up the cudgels for him. It so happens, however, that Mr. Hardinge's strictures on this particular book give a very useful criterion for his own work. He is dreadfully angry with Mr. Lang for not translating *Ballades* and *Rondeaux* into the exact rhymes and metres of the original. Considering that Mr. Lang's book was published in 1872, and that Mr. Hardinge's own acquaintance with these forms (a not over-accurate one, as we shall shortly see) appears to be wholly derived from an essay of Mr. Goosse's, published in 1877, a little more charity might be desirable. However, Mr. Hardinge is doubtless desirous to show what an accurate person he himself is. So, too, such minute strictures as his assurance that "O ciel, je vous revois, Madame," is not properly represented by "Again I see you, ah my Queen," and that "All night I lay awake" is not good for "Je m'éveillais tous les quarts d'heure," must be meant to show the severe standard of literalness which Mr. Hardinge desires to have applied to his own work, plentiful specimens of which are vouchsafed. A short examination of this work on the principles thus indicated by Mr. Hardinge may be recreative.

Mr. Hardinge's general doctrine is that translations must be absolutely faithful in form as well as in matter. His chief claim to a particular discovery of principle is that the alternation of masculine and feminine rhymes in French must be represented in English by single and double rhymes. It is perhaps needless to say to any one possessed of an ear and of a knowledge of the two languages that this principle is utterly false. The final *e* of a French line has neither the metrical nor the rhythmical value of a full syllable, and the substitution of a full syllable for it in English, except in a very few instances, entirely alters the balance of the line. Let that pass, however. Mr. Hardinge vouchsafes examples from all ages of French poetry, though it

is rather odd that he mostly takes his examples from school-books. His descriptions of Thibaut of Champagne's poems as "troubadour singing" would seem to infer that he thinks that pleasant singer wrote in Provençal, which is a little unfortunate. However, he shall have the benefit of these doubts; and we will pass on to his version of Charles d'Orléans's famous "*Le temps a laissé son manteau*." Here Mr. Hardinge is very severe on Mr. Lang for giving the poem only twelve lines instead of fourteen. That is to say, he does not know that it is still a very moot point whether the strictest *rondel* form has thirteen lines or fourteen (the manuscript evidence being strongly in favour of thirteen), and that it is at least possible that Charles wrote only twelve. If any reader should ask how this is possible, we may explain in passing that the point is how often certain refrains are repeated. Critics who indulge in dogmatic condemnation on such points should give more evidence of full information than Mr. Hardinge does. However, let us take his version itself, remembering his standard of literal accuracy. "*De vent, de froidure et de pluie*" becomes in Mr. Hardinge's literal version "acold and wet from winter's prison." Mr. Hardinge has cut out the wind and generously put in winter and prison instead. "*Il n'y a beste ne oyseau Qu'en son jargon ne chante ou crie*" becomes "No birds or beasts but sing and cry In jargon at this merry season." But the last stanza is the best example of Mr. Hardinge's stern determination to be literal. The French is—

Rivière, fontaine et ruisseau
Portent en livrée jolie,
Gouttes d'argent d'orfeverie,
Chacun s'habille de nouveau.

This becomes—

Rivers and springs and brooklets lie
Newliveried where the ice has wizen,
And on the freshening leas they chruten
Are silver studs for jewellery.

One may certainly say, Bless thee, Prince of Blois, thou art translated. We have not space to comment on other poems with which (notably one of Vauquelin de la Fresnaye's) Mr. Hardinge has taken similar liberties. In discussing the celebrated "*Avril*" of Belleau, he falls foul again of Mr. Lang with equally evil results. He wants to show that the rhythm of the poem is "anapestic, although it may be hammered into spondee." Technical prosody is a subject rather ungrateful to most readers; but we may, perhaps, mention that this unlucky remark shows that Mr. Hardinge knows very little about it. The anapest may, or may not, once have been a possible French foot, but there are no anapests in "*Avril*," and no human being could hammer it into spondee. It is obviously trochaic, and Mr. Lang, who does know something of metres, has treated it as such. If anybody insists that every French poem must be got into iamb, it is needless to remind classical scholars that, with a slight change of base, almost any trochaic rhythm can be made iambic. But anapests are unnecessary and spondee impossible. This, be it observed, is not a question of opinion; it is one of scientific fact. More impressive to the average reader, however, will be a little misfortune of Mr. Hardinge's as to *Passerat's* May Day Ode. A translator of French poetry might at least be expected to know French. Mr. Hardinge, we fear, does not. *Passerat* wrote, "*En ce monde n'a du plaisir, Qui ne s'en donne*." That is to say, as any schoolgirl will tell Mr. Hardinge, "In this world none has pleasure but he who gives himself some"; or, as Mr. Lang fairly enough represents it,

In this world he hath no pleasure
That will none of it.

Mr. Hardinge translates—

There's naught in life that's worth desire
From it removed—

which is nonsense in itself, and has nothing to do with the original. In the same poet's *Vallanelle* this upbraider of selfish, careless translators gives us "Death no more my heart's appaller," for "Mort! que tant de fois j'appelle." Does Mr. Hardinge *par hazard* think that "appeller" means "to appall"?

We have unluckily no space to go through this amazing monument of conceited incompetence. That Mr. Hardinge makes *Gilbert*, in the well-known elegiac ode on himself, remark, "In life's gay feasting hall a luckless reveller bidden, One hour I sit one hour I die," as if the session and the death were alternative and recurrent, is perhaps only a slip of expression, as the remarkable statement that *André Chénier* wrote verses on "*the scream* between Calais and Dover" is perhaps only an example of amiable historic confusion. Two more instances, however, of the sort of work which finds room in one of the chief English reviews must be given. It is *à propos* of the *Juana* of Musset, whom by the way, he always speaks of as *De Musset*, that Mr. Hardinge is so very severe on Mr. Lang's loose renderings. In the same poem, over which he has thrown an air of vulgar burlesque, he has himself mixed "thee" and "you" in the fashion of the clumsiest schoolboy verse, has rendered "*Qu'à l'hiver sans qu'il y paraisse*," "It seems a jest: come next December," and "*Et toi qui ne t'en souviens pas*," "You whose sweet heart no memory trieth," makes "lady" rhyme constantly, more *Scotorum*, to "ready," and converts "*Et la diabolique journée*" into "That day-long frolic of Geheuna." This, however, is as nothing to the havoc he works with *Théophile Gautier's* glorious piece on Art. This is at once the lesson and the model of

absolute formal perfection in poetry, and here is Mr. Hardinge's version of its second stanza:—

No false constraint I crave for;
But, Muse, to walk you need
To have your
Buskin to fit indeed.

"Théo" was the most good-natured of men, but it is perhaps lucky for Mr. Hardinge, after giving such a rhyme as "crave for" and "have your" as an equivalent of Gautier's exquisite work, that his own head is not in the place of that "tête de Turc" on which the athletic poet used to delight "amener deux cents."

We have done with Mr. Hardinge, and perhaps some of our readers may think that we have taken too much trouble with him. Unluckily, when anybody furnished by chance or injudicious friends with a good tall pulpit, speaks with an air of authority from that pulpit on subjects which the general public does not understand, he runs a fair chance of being accepted as an oracle, if he is not duly taken down from his perch. Literary criticism is enormously voluminous nowadays, and it can only justify itself by being based on the most accurate and extensive knowledge. Mr. Hardinge's knowledge is very far from being accurate or extensive. But he has done more than merely criticize. He might very justly have found fault with the looseness of much modern translation, and though we do not think that his own suggestions for drawing the cord tighter are very happy, his opinion might at least have stood for what it is worth. But the copious specimens of professedly improved translation which he has volunteered take him out of the category of mere critics. He has undertaken not merely to break a stone, but to make a stone, and a very pretty stone, indeed, he has made. With considerable wisdom, he has not given the originals of his versions, and as those originals are not in the possession of everybody, the unfaithfulness which is one of his own chief faults is likely to escape notice. If, on the other hand, these specimens had been modestly put forth by themselves, as an attempt asking for judgment, they might have deserved milder treatment. But inaccurate criticism accompanied by feeble performance, bad work accompanied by arrogant censure of much better work—this is a combination which it behoves watchful censors in their turn not to pass without notice. Mr. Hardinge appears to have some metrical faculty, and may possibly, for aught we know, be a successful adapter of words for music. Very few people (unfortunately) attend to the words of a song nowadays, and so Mr. Hardinge's "Day-long frolics of Gehenna" and "have your" rhyming to "crave for," and all the rest of it, may serve their turn well enough. But when rubbish of this sort is put forth with a flourish of trumpets as precious art-work, it is time to bestir oneself. Mr. Hardinge remarks, with profundity, "making verse translations is, after all, very like making jam." He does not (though "have your" and "crave for" might seem to indicate this) mean discords, but pots. We can only say that, if his own translations remind us of any fictile products, it is of those which Robinson Crusoe produced on a memorable occasion. But the good Robinson did not, if we remember rightly, send his masterpieces for exhibition, with a legend commenting on the glaring and detrimental nature of the defects of the work of less-favoured potters.

PARISIAN THEATRES.

THE theatres of Paris, like those of London, are suffering from a dearth of new plays. The old authors, so say the managers, have ceased to write, and no new ones present themselves. The Ambigu is still playing *Nana*, but the literature of the muck-heap, as we feel disposed to describe the later works of M. Zola, is so little to our taste that we did not go to see it. Those who have done so admit that they were disappointed. Impropriety and audacity have been excised, and dullness alone remains. The Chatelet shows no signs of abandoning that curious medley of ballet, circus, farce, and drama (we class the ingredients in the order of their importance) called *Michel Strogoff*; the Porte St.-Martin has filled a gap by reviving our old friend *Trente Ans; ou la vie d'un Joueur*; and the Vaudeville has fallen back on *La Princesse Georges* and *Une Visite de Noce*. The Gymnase has tempted fortune with a new comedy in three acts called *Monte Carlo*, in which the audience has the satisfaction of seeing an exact reproduction of one of M. Blanc's gaming saloons, and some amusing illustrations of the odd superstitions of gamblers; but the intrigue is poor, and the acting not particularly good. There is, however, one novelty sufficiently important to be noticed in detail. It is by M. François Coppée, one of the three most popular of living French poets, the other two being M. Leconte de Lisle and M. Théodore de Banville. M. Coppée's historic drama, *Madame de Maintenon*, in a prologue and five acts, in verse, which has just appeared at the Odéon, is the most ambitious work that he has yet attempted, if we except another five-act drama, also in verse, *La Guerre de Cent Ans*, which appears in his published works, but which no manager has yet been bold enough to mount. The action of the prologue takes place in the house of Scarron, in 1660. Françoise d'Aubigné, before she became his wife, had been beloved by Antoine de Méran, a young Huguenot, who has just returned to France after a ten years' absence. They were only children in those days; but she had never forgotten her boy-lover, and his exile had been cheered by the hope of finding her free on his return.

Antoine departs for America, taking with him his young brother. Before he goes, however, Mme. Scarron gives him a hymn-book as a keepsake, in which she has written her own name and his, with the words "Au revoir" and the date. The play begins fifteen years afterwards, when Mme. Scarron has become Mme. de Maintenon, and a great personage at Court. Her marriage with Louis XIV. is about to take place. She has, however, one determined enemy, the Minister Louvois, who watches her incessantly, and hopes, before it is too late, to find out something sufficiently to her discredit to induce his master to abandon his intention. At this juncture Samuel de Méran, the brother of Antoine, and his living image, returns from America. Antoine is dead, and has charged Samuel to give back the hymn-book to Mme. de Maintenon with his own hands. In it he has written, under the former inscription, the word "Adieu." Louvois observes her confusion when Samuel is announced, and her emotion as she takes the book. We should here mention that a Huguenot conspiracy is going on, the Edict of Nantes having been revoked, chiefly through the influence of La Maintenon, as the Huguenots believe. In the second act we assist at a meeting of the conspirators, of whom the chief is a M. de Croix St.-Paul. Samuel de Méran has been induced to join them, and listens to a proposal made by an envoy of William of Orange to aid them with a considerable force, on the condition of receiving certain French towns in exchange for his assistance. The terms are about to be accepted, when Samuel bursts out with an appeal to their patriotism, which so changes the feeling of the meeting that only two votes are recorded in favour of the proposition. M. de St.-Paul, who sees that all action is now hopeless, suspects treachery on the part of Samuel, whose interview with the hated Maintenon has become known to him. Thereupon, to try his sincerity, he proposes to him to assist in a plot to seize the person of the young Duke of Burgundy as a hostage. Samuel accepts. Louvois, however, is informed of the plot, and of Samuel's share in it. He has also become possessed of the famous hymn-book, and imagines, not unnaturally, that Antoine de Méran had not only been the lover of Mlle. d'Aubigné, but that Samuel is her son. The plot fails; Samuel and the others are arrested, and the proofs of Mme. de Maintenon's supposed infidelity are placed in the King's hands. In the fourth act the King holds a Cabinet Council in Mme. de Maintenon's bed-chamber, after which she begs the life of Samuel. Then comes the most dramatic scene in the play. The King discloses to her his knowledge of the existence of the hymn-book, and his conviction that Samuel is her son. In vain she denies the accusation, the King refuses to believe her; he signs the pardon, however, and hands it to her, but under the terrible condition that if she makes use of it she must at once leave the Court. Placed in such an alternative, she hesitates for a moment; but her eyes fall on Antoine's gift, which the King had left with her, and she determines to sacrifice her ambition to save the life of his brother. She hurries to the prison, and implores Samuel to accept the pardon. He, however, suspected by his Huguenot friends, who, as they pass on their way to the scaffold, cry "Judas" at him, prefers death to a dishonoured life, tears the paper, and joins his comrades as the curtain falls.

In this analysis we have kept ourselves strictly to the main outlines of the play. There are, however, many interesting episodes, and allusions to passing events, cleverly introduced so as to help the accuracy of the historical picture, the fidelity of which is further assisted by a scrupulously exact *mise-en-scène* and correct dresses. We gather, therefore, as the play proceeds, a very clear notion of the atmosphere of plot and counterplot in which the "Grand Monarque" lived; and of the difficulties with which Mme. de Maintenon had to contend in mounting step by step the ladder of her high ambition. After all, however, what was M. Coppée's leading idea in writing *Madame de Maintenon*, viewing the work not as a history, but as a play? We think it is clear that he meant his great scene to be that in which the alternative of Samuel de Méran's life or the crown of France is proposed to Mme. de Maintenon. Such being the case, we submit that under his treatment of the situation curiosity may be excited, but that is all. For, after all, what is the young man to her? He is only the brother of a Huguenot who had never been seriously her lover, and with whom she had had only a single interview (that in the prologue) since she was twelve years old. His life or death could not, therefore, move her greatly; and the scenes in which she recalls the memory of Antoine, and so passionately pleads with the King for Samuel's life, and then entreats him to accept the proffered pardon, sound like "a tale of little meaning, though the words be strong."

The part of Mme. de Maintenon has been taken by Mme. Fargueil. She is, or rather has been, an excellent actress; but years have told upon her, and her voice is hardly strong enough for the size of the Théâtre de l'Odéon. Moreover, she has never had many opportunities of speaking verse. M. Lacroix, who plays Louis XIV., labours under similar disadvantages. The brothers de Méran are acted by M. Chelles, a young actor, who has only lately returned to the Parisian stage from Russia. We saw him a few months ago in *Jack*, a play founded on Daudet's powerful novel; and his present admirable performance does but confirm the favourable opinion we then formed of him. If he goes on as he has begun, he may in a few years be one of the first of French actors. The minor parts are all respectably performed.

Le Bourgeois Gentilhomme, which was one of the pieces revived at the Comédie Française for the anniversary of last autumn, has been lately given again. Great care has been

taken to present it exactly as it was originally given before Louis XIV. at the Château de Chambord, October 14, 1670; so as to give as accurate an idea as is now possible of one of the Court entertainments of that period. The dresses have been studied from contemporary authorities, and the original music and ballets are all introduced. Nothing can be imagined more beautiful than this combination of historical research, graceful movements, agreeable sounds, and admirable acting. The absurdity of the situations into which M. Jourdain is led by his love of great people and their ways is enhanced by the pomp and circumstance with which he is now surrounded. For instance, when the tailor brings home his new suit of clothes, and directs his servants to put them on "in the manner they use with people of quality," the whole business is done solemnly to the sound of music, the tailors gravely dancing round and round him, while some undress him, and others, still dancing, present each new article of dress. The fun, of course, culminates in the *Cérémonie Turque*, when he is initiated into the faith of Mahomet, a scene to which the magnificent architecture of the hall in which it is played, and the rich colours of the oriental dresses, impart the splendour of a picture by Veronese. M. Thiron plays M. Jourdain with infinite humour, and a total absence of vulgarity; and Mlle. Jouassain impersonates his wife with equal ability. The natural high spirits of Mlle. Samary stand her in good stead as Nicole; and, though she may not have all the graces of Mlle. Augustine Brohan, whom we saw in the part some years ago, yet she plays it with much liveliness and spirit. We must not forget either M. Truffier, the "maitre de danse," who dances as gracefully as if he had been a ballet-master all his life; or M. Göt, who glorifies the small part of Le Mufti into a great comic impersonation; or M. Delaunay, who displays a charming humour as the Turkish Prince. The *Cérémonie*, as presided over by him, is alone worth going to see.

The Parisian public, as we expected, has declined to make *La Princesse de Bagdad* the success that was expected by the author and M. Perrin. The Comédie has, therefore, been constrained to produce a new piece—a comedy in three acts—called *Le Monde où l'on s'ennuie*, by M. Pailleron, the only one of the older writers still available. He is known as the successful author of *Les Faux Ménages*, a powerful but disagreeable piece in four acts, played at the Français in 1869; and of several triffles, of which the latest and prettiest, *L'Étincelle*, is so popular in Paris, and was so strangely misunderstood in London. *Le Monde où l'on s'ennuie* is a bright and bustling comedy of modern life, dealing with literary and scientific people, their parasites, and their imitators. More than twenty characters take part in the action, in some of which well-known persons may be recognized; and the dialogue, which is full of hits at the follies of the day, is unusually brilliant. It is needless to say that it is admirably acted by the principal artists of the company. Before concluding, we may mention a curious experiment that M. Perrin is about to make. Having been reproached for not giving the younger artists an opportunity of appearing, he has determined to present them "standing staring altogether," in a solemn revival of *Le Mariage de Figaro*. Mlle. Barretta will play Suzanne, M. Coquelin cadet Figaro, and so forth. We shall await the result with interest; but we can hardly look forward to a success. Indeed, we much doubt whether M. Perrin is anxious to achieve one.

We are sorry to see that the veteran actor M. Ravel died last week. He had been on the stage for nearly half a century. In his younger days he acted at the Théâtre du Palais Royal with Arnal, Bouffé, and Lesueur, and his name will be found among the performers in most of the celebrated pieces that made the reputation of the Theatre at that time. Like his greater contemporaries, however, he did not merely excite laughter. He had considerable command of pathos, and was thus enabled, as he grew older, to play parts less directly farcical, as, for instance, that "very foolish fond old man," Brigard, in *Froufrou*.

REFUNDING THE UNITED STATES DEBT.

THE new Secretary of the United States Treasury has put forward a refunding plan, which, in many respects, is not a little remarkable. The portion of the United States Debt bearing 5 and 6 per cent. interest falls due in the present year; and, at the meeting of Congress in December last, Mr. Sherman, who was then Secretary of the Treasury, recommended a plan of refunding which, in principle, was adopted by Congress; but the Bill, as it ultimately passed, departed from the Secretary's recommendations in two material particulars. It reduced the rate of interest from 3½ to 3 per cent.; and, as Congress doubted whether the bonds at that rate of interest would be freely taken in the open market, it made it compulsory on the national banks to hold the new bonds as security for their note issues. The banks objected so strongly to this latter condition that they began to surrender their right of issue, for that purpose calling in the loans made by them for short periods. The public took alarm, fearing that they could not obtain the accommodation they required; and for a while it looked as if there would be a panic in New York. The interest paid on money for a few days reached for a little time the rate of 300 to 400 per cent. per annum; the prices of Stock Exchange securities fell from 10 to 20 per cent.; and, in short, so great was the disturbance, that the President vetoed the Bill. The

incident happened at a most inconvenient moment. The old Congress was about to come to an end in a day or two; and, at the same time, the President himself was about to go out of office, with his whole Cabinet. It is a striking instance of the difference between the governmental systems of England and the United States that the President, just at the very end of his term, had the courage to veto a Bill which had passed both Houses of Congress, and that in doing so he had the support of the public generally. When the new President entered upon his administration, he found himself in this difficult position. A portion of the Debt amounting to about 140 millions sterling was about to fall due, and no provision had been made by Congress with which to meet it. It is true that the Debt was merely payable—that is to say, need not necessarily be paid off. But the credit of the United States was good enough to reduce interest to 3½ per cent., and it would, therefore, be sheer waste to go on paying 5 and 6 per cent. Besides, the money market could hardly be expected to settle down and confidence to be restored while the refunding question remained in suspense. Yet there was a general fear that, if the matter was again referred to Congress, the disturbance might be repeated. The question, then, for the new President and his Cabinet to consider was, What was to be done? Here in England we should answer at once, "Call Congress together, and let it decide." But, as we have said, in the United States there was a very strong popular feeling against calling Congress together. This unwillingness to remit the matter to Congress affords striking evidence of the low estimation in which representative government is held in the United States. *A priori* one would think that a more unsatisfactory way of selecting an administration could not be devised than the American. Candidates for the Presidency are nominated by conventions of delegates, elected outside the law at hole-and-corner party meetings, and without any legal assurance whatsoever that there is a *bona fide* election; and the candidates are selected on the principle of excluding the best known and the ablest man. Yet, as a matter of fact, the President enjoys the confidence of the public in a far higher degree than does Congress, as is proved most strikingly by the case before us. The new Secretary of the Treasury went to New York to consult with the leading bankers from all parts of the country, and unanimously they urged upon him not to call Congress together, but to adopt a plan himself, for the express purpose of settling the matter without reference to the representatives of the people. And this course the Secretary has in fact adopted, with almost universal approval.

The plan is this. Mr. Windom has called in the whole of the 6 per cent. bonds, amounting in round numbers to about 39 millions sterling; but he has added a proviso that any holder of these bonds who wishes may send them into the Treasury with the request that a new agreement shall be stamped upon their face reducing the rate of interest from 6 per cent. to 3½ per cent., and that then they shall be allowed to stand out. It is contended by Mr. Windom and the bankers generally that this is not a new borrowing; and possibly, in strict law, it may not be so. Unquestionably there is not a new bond executed—that is to say, the old bond is not destroyed and a new one substituted for it. Yet, if we put aside special pleading, and look at the matter from a plain common-sense point of view, it appears clear that a new contract is really entered into. The Secretary of the Treasury calls in the 6 per cent. bonds, and by the fact of doing so it would seem clear that they have ceased to be current, and ought to be paid off and cancelled. Instead of doing so, however, at the request of the holders of the bonds or a proportion of them, he substitutes a 3½ per cent. rate of interest for a 6 per cent. Surely this is a new borrowing to all intents and purposes. At any rate, if not a new borrowing, it is a new contract. It is a prolongation of an old loan on new conditions, and, according to all the principles of representative government, it would seem that this cannot and ought not to be done by a Minister without authority from the legislature. Mr. Windom and those who approve his course, however, contend that an authority from Congress is not required; that the holder of the bonds is perfectly competent, if he pleases, to take 3½ per cent. instead of 6 per cent., and that the Secretary merely complies with his request; that the Secretary is not bound to pay off the Debt, and is not bound to pay a higher rate of interest than the holder of the bonds is willing to accept. It will be understood that we are not here examining the legality of the act. Our object rather is to call attention to the wide latitude which American Ministers claim for themselves and which American public opinion allows where here in England we should hold our Chancellor of the Exchequer to the strict letter of the law. It is remarkable, too, that the banks do not appear to entertain a doubt as to the binding character of the reduced bond. Should any one choose to question the authority of the Secretary of the Treasury, it possibly might be held that he had exceeded his powers, and that this new contract is not binding. In that case the question would arise whether the old bonds had expired, and whether the new contract could be enforced. Yet public opinion in the United States seems to have decided that it is perfectly safe to accept this arrangement with the Secretary, and it is generally expected that the new plan will be successful. It is announced furthermore that the Secretary of the Treasury has already sent an agent to London to receive the bonds of the European holders who may wish to retain them at the reduced rate of interest, and no doubt is felt that here also the plan will be accepted. If this should prove to be the case, and the great majority of the 6 per cent. bonds are retained by the present holders, the Secretary will pro-

ceed to do the same with the 5 per cents., which amount to about 100 millions sterling or a little over. But if the general expectation should be disappointed, and a large number of holders should prefer to receive their money rather than to enter into a new contract for which there is no Congressional authority, the Secretary of the Treasury has the means of satisfying them, so far at least as the 6 per cent. bonds are concerned. He holds at present a very large amount of cash in the Treasury, by means of which he can pay off a considerable amount of the bonds, and, if this fund should be exhausted without paying off all the bonds presented for payment, he possesses, or believes that he possesses, authority to issue new 4½ per cent. bonds to the amount of 21 millions sterling. By an Act passed some years ago for refunding the debt at a lower rate of interest, the Secretary of the Treasury was empowered to issue a certain amount of 4½ per cent. bonds, which he never exhausted, finding that he could equally well issue 4 per cents., and, of course, preferring the bonds bearing the lower rate of interest. The present Secretary of the Treasury contends that the power which is given under this old Act has not expired; and, we believe, that in this contention he is supported by Mr. Sherman, and by the present and past Attorneys-General. The contention would seem, to English notions at least, open to question. The Act to which we refer was passed for the purpose of refunding a portion of the Debt then about to fall due, and the authority given to the Secretary of the Treasury was to issue bonds bearing various rates of interest, but all in the aggregate not exceeding a certain amount. The Secretary of the Treasury preferred to issue the whole amount of 4 per cents. which he was empowered to do, and it would, therefore, seem that all his powers were exhausted. But Mr. Windom contends that this is not so, and he is prepared, as we have said, to issue 21 millions sterling of 4½ per cents. if the necessity should arise. In all this criticism, we repeat, we are expressing no opinion as to the legality of the steps taken by the Secretary of the Treasury. Our object, as we have already said, is to bring out the difference of practice as regards a money matter, on which generally there is so much jealousy of the Executive, that prevails in the two great English-speaking nations, both equally attached to freedom. Here in England, the most powerful and the most popular Chancellor of the Exchequer would never be allowed to strain to such an extent an Act of Parliament, and, indeed, it may be doubted whether the most autocratic Minister that England has seen for the last hundred years would ever think of assuming so much authority. It is to this point, and to the low esteem into which Congress has fallen in the United States, that we would direct attention. We are content to assume that the Secretary of the Treasury is acting upon the best legal advice, and that he will be sustained in his opinion by the decision of the courts, should the question ever be brought to a judicial issue.

As legal doubts do not seem to be felt, it is highly probable that the holders of the Fives and Sixes will generally consent to retain their bonds at the reduced rate of interest. It is perfectly certain that the credit of the United States is good enough to borrow at 3½ per cent., and perhaps even at a little lower; and, therefore, the holders will feel that they cannot make a better bargain than to receive at par the new 3½ per cents., which probably in the course of a very little while will rise considerably above par, and thus what they lose in interest they will gain in principal. Here in Europe, too, the same considerations will have their effect, though it is possible that in Europe there may be stronger doubts entertained of the legality of what the Secretary is doing. Still, the bargain is a tempting one, and it is probable that the Secretary's plan will be highly successful. Assuming that it is so, the process of reducing the United States Debt will go on at an accelerated rate. Between the close of the Civil War and the end of last June about 160 millions sterling of the United States Debt was paid off, and at the same time the charge of the Debt, partly by these payments and partly by refunding, was reduced to about one-half. During the current financial year, which our readers will remember begins with July, there has been a further very large amount of debt paid off. And it is probable that a still larger amount will be paid off in the course of the next few months. Indeed, at present the rate of reducing the Debt is, at the very lowest, 20 millions sterling a year. When the reduction of interest is effected, all the interest saved will be available for paying off debt, and thus every saving effected goes to amplify the means for wiping off debt. It is extremely probable, therefore, as is generally assumed, that in the course of the next fifteen years the Debt of the United States will have disappeared, provided always, of course, that there is not such another panic, followed by a long depression, as was witnessed in 1873. The Secretary of the Treasury's plan is, as we have said, simply to leave the old bonds outstanding, so that they can be paid off as rapidly as he has the means of doing so. Up to the present the bonds have run for a fixed period certain, at the end of which period only the right of redemption arose; but now these "extended" bonds, as they are called, will be payable at any time the Secretary chooses to call them in, and he will, therefore, have it in his power to use the entire surplus at his disposal in the reduction of debt as rapidly as it accumulates.

THE PICTURE GALLERIES.

DESPITE the absence of Mr. Burne Jones, whose loss is now deplored with every outward token of sincerity in quarters where his talent was the least admired, the exhibition of the Grosvenor Gallery presents a very interesting and varied display of artistic work. Strange to say, it is more than usually strong in the kind of painting that is popularly supposed to have no claim upon its hospitality. The higher forms of imaginative design suffer no neglect, and the examples in this kind contributed by Mr. Watts are among the artist's most successful achievements. Sir Coutts Lindsay also sends a large and powerful composition in illustration of Dante, and Mr. Britten and Mr. Richmond are represented by important canvasses of a decorative character. But it nevertheless remains true that some of the most impressive work in the Gallery belongs distinctly to the realm of realistic art. Portrait and landscape, which offer the noblest employment for the resources of realism, have rarely been so fully or so powerfully represented. In the place of honour in the East Gallery hangs a portrait by Mr. E. J. Gregory, which is truly a masterly performance in its kind. Mr. Gregory interprets character in no spirit of compromise. He is ever on the look out for the beauty and refinement that belong to his own art, and there is, indeed, beauty of a very high order in the work before us; but he does not seek by any means to soften the facts of nature, or to enhance the charm of his subject by substituting a face and form of his own creation. He is, in short, a vigorous realist, armed in an exceptional degree with the technical power needed to reproduce his impressions. And yet, underlying and controlling these technical gifts, we may detect a fine sense of style, by the aid of which the painter is able to give to the most literal and veracious copy of nature a certain dignity of its own. Mr. Gregory, as may be judged from this example of his work, is also a gifted colourist. The painting of the flesh tones in the face, and the execution of the white satin dress, could only have proceeded from an artist whose taste and perception are as highly cultivated as his hand. It is impossible, in looking at this remarkable portrait, not to be reminded, as much, perhaps, by force of contrast as by resemblance, of the portraiture of Mr. Millais. There are two pictures by the popular painter in the present exhibition; and in both of them there is an ample display of power. The first is a version of the same face and form that have served as the model in *Cinderella*; the second—which may almost be considered a sketch on a large scale—is a half-length portrait of Mrs. Perugini. In the skill bestowed upon isolated passages of his work, Mr. Millais can always, when he so chooses, place himself beyond the reach of rivalry, and he may equally be said to stand alone in the extraordinary sympathy which he can command with the most opposite types of character. What he lacks in his art is just that feeling for unity of effect which forms such a marked characteristic of Mr. Gregory's work. With the strength of a giant in all that concerns the rendering of particular realities either of colour, texture, or surface, he nevertheless constantly misses that subtle element of harmony which is needed to bring the separate portions of his work into right relation. This defect, it must be said, is always least prominent in compositions of only a single figure, such as the delightful child portrait here exhibited. The colouring of the face, of the most brilliant quality, is skilfully supported by the masterly rendering of the fair tones of the dress, and both again are powerfully enforced by the dark background which encompasses and defines the figure. In the same panel hangs the work of an artist whose realism is of a wholly different order. Mr. Holman Hunt, whose head of Professor Owen recalls the manner of the early German painters, leaves about his painting the traces of effort. The result, however admirable, is evidently gained by much labour. It represents a complex and minute process of execution applied to effects of light and colour that are sometimes of the most fleeting character, and thus it will sometimes happen that, though each separate touch may be verified by the witness of nature, the work as a whole misses the force and magic of illusion. Allowing, however, for these limitations of style, which belong to the general system of his art, and affect the quality of his invention no less than the technical character of the execution, this portrait of Professor Owen may be regarded as a very remarkable example of the painter's powers. Though the character of the face has been laboriously built up, as it were, by a series of separate and independent touches, it carries at last an impression of force and power. The truth would seem to be that Mr. Hunt's peculiar method is specially adapted to the rendering of features strongly and definitely marked. It succeeds less completely in giving the freshness and beauty of youth where the emphasis of detail is always in danger of overpowering the truth of the general impression. Here, it must be confessed, the realism of Mr. Millais, though less searching and methodical, comes nearer to illusion. Among other examples of vigorous portraiture to be found in the exhibition, the several heads contributed by Mr. Collier occupy a prominent place. The likeness of Lady Lawrence is remarkable for an original and effective treatment of light and shade; but perhaps the work that displays to greatest advantage Mr. Collier's masculine manner of working is the head of Mr. Walter Pollock, where the execution is wonderfully free, certain, and effective. There is here no appearance of labour, and yet the slightness and liberty of method yield a result of strength and solidity. In the portraiture of Mr. Richmond, of which there

are numerous and interesting examples, we come upon work of widely different aim. Mr. Richmond scarcely attempts to imitate texture and surface either in the flesh-painting or in the rendering of costumes. He finds his success upon refinement and completeness of design, and is content for the most part with broad and simple effects of colour. Perhaps the most complete expression of his style is given in the seated figure of the Bishop of Salisbury, which, according to its own standard, deserves to rank among the most remarkable portraits of the year. But this sentiment for beauty of outline and delicacy of modelling which belongs to Mr. Richmond's work is most happily employed upon the faces of women and children, and the portraits of Miss Holland and Mrs. Lyulph Stanley in the large room, to which may be added the graceful head of the Princess Louise, are admirable instances of what may be achieved by a painter who deliberately renounces many of the qualities of realistic colour which are commonly sought for in portraiture. We must not omit from the list of works in this class the contributions of Mr. Frank Holl, executed with an even and sustained vigour of handling, and marked by a firm grasp of individual character; and we may also direct attention to the several portraits by Mr. Hallé, and to a solidly painted head by Mr. Partington, a Manchester artist of ability and promise.

The array of landscapes in the exhibition is scarcely of inferior interest. In the East Gallery hangs a large and impressive study of the mountain scenery of Wales by Mr. Herkomer. For a work executed out of doors and in direct contact with nature, it displays remarkable unity and concentration of effect. There is no excessive elaboration of detail, though the rocky surface of the foreground is carefully and completely rendered; but there is in every part of the picture a fine sense of the quality and value of colour. With a canvas of these dimensions, and with a subject that has no incident to divert or distract attention, it would have been easy to have failed where Mr. Herkomer has succeeded. Anything less than the refinement of sentiment and of observation that he has brought to his task would inevitably have suggested the criticism that such a theme did not deserve to be treated on this extended scale. But Mr. Herkomer has avoided the reproach of emptiness by the delicate beauty of his colouring, and he has justified the choice of a large canvas by the solemn and dignified impression which he has succeeded in producing. In the next room hangs a landscape, of almost equal dimensions, by Mr. Mark Fisher, a painter who loves to depict the pastoral scenery of France, and who betrays in his method the influence of certain masters of the French school. As a representation of the season of spring the picture is possibly open to the objection that the general scheme of colouring is needlessly subdued. It would have been a more complete triumph for the artist if he had succeeded in infusing the same spirit of tranquillity that now animates his work into a composition of stronger and more vivid tone. But, according to the view that he has chosen to take of his subject, the picture deserves little but praise. The colour, though not of great strength, has admirable quality, and the execution is wonderfully broad and simple in character. There is no affectation of mastery, no failure anywhere of the power needed to give effect to his purpose; and in these respects the picture might serve as a model of style to the school of landscape-painters who are disposed to force certain portions of their work into competition with nature and to smudge and smear the remainder. Mr. Lawson's landscapes naturally attract a considerable amount of attention in the Grosvenor Gallery, for it was through these annual exhibitions that his talent was first made widely known to the public. It is gratifying to find upon the testimony of the several works bearing his name that the artist has taken a new departure in the manner of his painting, and that he is able to vary and extend his scheme of colour. Such art as this, with its strong admixture of poetical sentiment, stands in need of constant refreshment from the study of nature. The qualities for which it is most admired may easily be transformed into conventional defects, unless the painter is careful to keep his imagination always supplied with fresh material. Mr. Lawson has found inspiration for his recent work in the picturesque scenery of Yorkshire, and his two principal pictures illustrate the beauties of wild moorland and fruitful vale with a power and completeness of effect that he had not before attained. The "Valley of Desolation," with its sharp contrast of blue sky and lowering cloud, and its wide expanse of barren heath, is marked by a kind of dramatic quality that is especially rare in modern landscape. The colouring, it may be added, has a greater distinctness than has been usual in Mr. Lawson's later works, and there is an equal sense of mystery without the same sacrifice of definition in form. We may add to the list of landscapes the "Forget-me-Nots" of Alfred Parsons, the view of a Berkshire hill by Keeley Halsewelle, and the delicate studies of Algerian scenery by Mr. Barclay. Mr. Howard, Mr. Walter Craze, Mr. Phil. Morris, and Mr. Buxton Knight are also among the contributors in this class.

OTHELLO AT THE LYCEUM.

THE performances given of *Othello* on Mondays, Wednesdays, and Fridays at the Lyceum Theatre are remarkable, not only for the appearance of three great performers in the parts of Othello and Iago and Desdemona, but also for a completeness of cast and a well-tempered beauty of mounting which probably have never been surpassed, if, indeed, they have ever been rivalled. We can-

not point even to a suggestion of incompetence in any part, however subordinate; while the more important characters are played with a spirit and success which might atone for other shortcomings if they existed. To this we shall recur after speaking of the performance of the three leading parts. Of Mr. Booth's Othello we have already written at some length. The impression given by his representation at the Princess's of the truth of his conception and the skill and daring of his execution of the part is, as might have been foreseen, deepened by his appearance in circumstances so much more favourable. The chivalry, the poetry, the dignity of the part seem now more marked than they were before. The valiant Othello, as represented by Mr. Booth, has nothing of the savagery which has been imported into the character by actors whose gifts have sometimes blinded their audiences to what strikes us as the radical defect in their idea of the character. It is difficult to reconcile the notion of the not only blind, but absolutely degrading, fury which has on some occasions been attributed to Othello either with his winning such a wife as Brabantio's daughter, with the high repute in which he is held by the magnificoes, or with the account given of his nature by Iago, not to others, but to himself in soliloquy. Mr. Booth's Othello feels it as a bitter degradation to have threatened Iago, under the influence of the strongest passion, with his dagger, and to have asked him to set on his wife to observe. He would be incapable of actually kicking the prostrate body of an uncomplaining person whom he takes to be his friend. The chivalrous and romantic idea of the character which is illustrated by such points as these is, as we have said, more successfully apparent now than it was when Mr. Booth played the part amid surroundings which were not worthy of him; and there are some special points in his representation which gain so much from the changed atmosphere, that it is worth while to dwell upon them once again. Among these are the complete command and dignity of "Keep up your bright swords," the playing of the very difficult scene in which the Moor is employed at one moment in welcoming Lodovico and at the next in letting loose his waked wrath on Desdemona, and the throwing away—already referred to—of the dagger with which he threatens Iago. The speech to the Senate tells now much better than it did before, but we still have to object to the leading up to the point of "and I loved her that she did pity them," which mars the full effect of the line "This only is the witchcraft I have used." It must be noted, however, that this line is given with a complete dignity, which before it seemed to lack. So also in the great scene with Iago, the overpowering effect of Othello's passion, the more terrible because it is restrained by the sense of dignity which should belong to a great general, seems greater. In thus repeating our admiration for Mr. Booth's at once strong and romantic Othello we have only two criticisms to add. The lines

I kiss'd thee ere I killed thee: no way but this,
Killing myself, to die upon a kiss.

are so completely in consonance with the actor's conception of the character—which we take to be the true one—that their omission seems markedly unfortunate. The only other fault we have to find is a matter of stage management rather than of acting. There seems to us to be a certain want of dignity in the double action which Mr. Booth employs with his sword in the scene of the brawl. To strike up the swords of the quarrellers would surely be enough without making a second downward stroke at Cassio's blade.

Mr. Irving's Iago had been eagerly expected. It had long been thought that he might play this part with signal success; but perhaps even his most constant, by which we do not mean his blind-est, admirers may not have been prepared for the completeness of the success which he has attained. That the performance would be charged with thought, invention, and the highest skill in some directions could be easily foreseen. That the actor should, to these tolerably certain merits, add an entire throwing off of the mannerisms which have sometimes gone to injure his efforts was less to be expected. In this matter Mr. Irving curiously bore out Mr. Byron's very sensible theory that it is unsafe to judge a play or a player by a first night's performance. The fine qualities just referred to were present in Mr. Irving's Iago when he played it on Monday night, but they were then far less fully discernible than they were on Wednesday. On the first night some of his best effects came, compared with his subsequent performance, tardy off, in consequence no doubt of the nervousness which, as far as one can learn, all fine actors experience in undertaking a new and important part for the first time. With, as it seems to us, one exception, Mr. Irving shows us an ideal Iago; and this exception we take to the seriousness of the revengeful motive which he gives to the Ancient. He seems to take Iago's jealousy of Othello, if not of Cassio, with regard to Emilia as a real thing, and it has always seemed to us to be a kind of myth conjured up by Iago to at once excuse and amuse himself. Jealous he was undoubtedly, but hardly, perhaps, in that direction, and no lesser form of jealousy could be taken as an extenuating circumstance. However, Iago is from any point of view an extraordinarily complex character, and there is no doubt plenty of room for the idea which Mr. Irving seems to us to have adopted. Granted this, and, as it only comes forward in a very few passages, it can readily be granted, the actor's Iago seems to us first-rate all through both in conception and in execution. He is, in a sense different from the original one, all things to all men, the blunt reluctant counsellor of Othello, the pleasant travelled boon companion of Cassio, the complete man of the world who dazzles and honours Roderigo by taking him into his confidence, the rude yet fascinating husband to Emilia, and, in his own company, the

demi-devil who makes, at the risk and cost of his own undoing, the net that shall enmesh them all. It may be noted as a fine stroke of art that, except in soliloquy, he seems, through all the varying shades of character which he assumes a fellow of exceeding honesty. Mr. Irving conveys, by many fine touches, a sense of Iago's constant watchfulness over himself as well as over others. Thus, when he is left alone in the Sagittary, he thinks out his scheme with quick, but not unnaturally quick, astuteness; and, just as he is triumphing in the prospect of his success, footsteps are heard and guards with lighted torches pass along the corridor at the back. In an instant the whole nature of the man seems to change, and, in place of the plotting and exultant villain, we see a light-hearted soldier of fortune, who goes out towards and along the corridor carelessly humming a snatch of melody. In the first Cyprus scene Mr. Irving's delivery of the well-known speech beginning "She that was ever fair and never proud" seems to us as good as possible, as does his "aside" while Cassio is talking to Desdemona. There is another singularly fine touch in the subsequent soliloquy, "That Cassio loves her I do well believe it." In saying this to himself Mr. Irving's Iago has no hesitation; but when it comes to "That she loves him" he pauses, and the following words, "'tis apt, and of great credit," are the invention of a will which, for a moment puzzled, sees its way suddenly to solving a difficulty. We have already alluded to the signal merit of Mr. Irving's acting in the drinking scene, in which he sings capitally, introducing at one point, with good effect, a mandolin accompaniment, as we have to the honest reluctance with which he seems to give his evidence against Cassio. Close upon this, and upon his seemingly friendly cheering of Cassio, comes the soliloquy ending with "and out of her own goodness make the net That shall enmesh them all." The diabolical intensity of this was much aided by the impressive stillness of the actor until the last picturesque and meaning gesture of triumph.

The naturalness and seemingly easy strength hitherto displayed came out, as they should do, even more strongly in the scenes wherein the Moor changes with Iago's poison, and a scene admirably played by both actors comes to a fine conclusion with the perfect hypocrisy of Iago's "My friend is dead; 'tis done at your request," and Othello's following expression of trust and friendship. So, again, in the scene with Emilia and Desdemona, the expression of sympathy, interrupted only by the very well given speech to Emilia, "You are a fool; go to," seems as spontaneous and real as possible, as does the astonishment assumed at the supposed first discovery of the brawl in which Cassio is wounded and Rodrigo killed. The stage-management of this scene cannot be too highly praised. In this Mr. Irving, like Mr. Booth in the same part, introduces a very effective and obviously legitimate business by showing Iago on the point of making an end of Cassio with a stab in the back, when he is interrupted by the arrival of others, and changes his attitude with swift dexterity. The stoical endurance shown in the last scene, the extraordinarily significant delivery of the words, "I bleed, sir, but not killed," and the shrug of the shoulders as Iago, passing out with his hands shackled, looks round at Othello, make a worthy ending to what will surely rank as one of Mr. Irving's very finest impersonations. His bearing and his aspect throughout seem to us excellent, in spite of the amusing suggestion made by a critic who seems to have very odd ideas about the play in general, and about Iago in particular, that so honest a man as Iago passed for could not possibly wear so handsome a dress.

Miss Ellen Terry's Desdemona is, as might be expected, instinct with grace and tenderness, which are exhibited with especial beauty in the scene when and after Othello rates her for her supposed unfaithfulness. Of this we may have more to say after the performance of the play next week with Mr. Irving as Othello and Mr. Booth as Iago. Mr. Mead's Brabantio is at once stately and pathetic. Mr. Terries is by very far the best Cassio we have seen. He is soldier-like, is a gentleman even in his cups, and gives more point to the speeches about wine by carefully avoiding any suggestion of making points of them. Mr. Pinero, in Rodrigo, without a touch of exaggeration, gives an exact picture of the "silly gentleman," which Iago calls him, combining with much skill the ideas suggested by both words. Miss Pauncefort plays Emilia with some force and with much discretion; and Mr. Beaumont, as the Duke, displays the same dignity and good elocution which were observed in his Duke in the *Merchant of Venice*. The play is, as we have hinted, beautifully, but not excessively, mounted.

THE SPRING RACING.

THE profits as well as the pleasures of racing men must depend in great measure on the weather, and the proverbial uncertainty of the Turf is aggravated by the provoking eccentricities of our inscrutable climate. Commencing with the Craven Meeting, the spring racing has been carried on under singularly depressing circumstances on the "high places" affected to the national sport. For, with the single exception of Newmarket Heath, there are few bleaker spots in Southern England than Epsom Downs when the wind has been shifting from east to north. If confirmed wet is likely to be productive of surprises, protracted drought is sure to be prolific of the disappointments which leave sanguine backers "out in the cold," often without the satisfaction of a start for

their money. When the going is heavy over a muddy course, some obscure outsider with the power of a dray-horse may show to the front amid the shouts of the Ring, as in Dan O'Rourke's memorable Derby, when the winner started with 30 to 1 against him. But, when the ground has been parched to the consistency of iron, many promising horses may go to pieces in their gallops; and we may believe that it is to the present persistence of the easterly winds that we owe not a few of the recent sensations in the betting. Indeed, some animals that had been made warm favourites have been acknowledged to have broken down, like Mr. Crawford's St. Louis, who was credited with the honour of the Middle Park Plate; while the rumours in circulation about others have been partially confirmed, either by their being withdrawn from their engagements, or by their subsequent performances. And, even when a horse continues sound, the state of the ground may have interfered seriously with his preparation, or he may be withheld from a comparatively insignificant race to save him for some event of more consequence. It is certain that a phenomenal drought like the present must test the stamina of our best blood stock, and search out all the weak points in their constitutions. And, when we see so many of the expected starters come to the post with nothing wrong about their limbs and in high condition, it is not only creditable to the knowledge and care of the trainers, but generally reassuring after all we have heard of the growing degeneracy of the racehorse. But, if a dry season tries the soundness of the horse, it tests to the utmost the qualities of the jockey; and then, especially those who are prudent, will do well to consider before putting on the money who is likely to have the mount. Over deep and holding ground the simple secret with most horses is to sit still, with steady hands, and not to hustle prematurely. It is when the course is hard, when the pace must be regulated, and when the consequences of a cannon may be doubly serious, that the talent and coolness of the rider come into play. So they were wise in their generation who backed the wary and experienced Archer to win the City and Suburban on Bend Or.

Had there been a westerly wind and less chilly sunshine, the Craven Meeting would have been pleasant enough, though on this occasion the Craven Biennial was tame. As a rule, people go to the Craven less for the actual racing than to listen to the gossip of the Heath, and to get lights that may be useful in forthcoming transactions. This year the attendance was small, nor was there nearly so much as usual to be learned. The winners for the most part disposed very easily of indifferent fields; though in some instances, as is too often the case, the public performances woefully disappointed the reputations that had been formed on private trials. On the other hand, it is improbable or impossible that the results of this year's Craven will be sensationally reversed in any of the great summer or autumn races, as has not unfrequently happened before. The Craven Biennial, which was run on the opening day, has been associated with signal victories that have proved strikingly delusive. This year Tunis ran an exceedingly good horse, justifying his promise and character as a two-year-old; but it is certain that neither of the competitors he disposed of with ease can ever show to the front, either in the Derby or Lodger. There was far more interest in the race for the Craven Stakes on the Thursday, as conclusions might be drawn from it for guidance as to the Two Thousand Guineas. Great things had been expected of Monarch, the handsome son of Kingcraft. On the strength of satisfactory trials he was supposed to have been entrusted with the money of his stable, which was very strongly represented by no less than three favourites. But Monarch was in difficulties early in the race; he knocked up a long way from the finish; while Lord Rosebery's Cameliard won by half a length from his stable companion, Golden Plover, who had been kept back specially for these Craven Stakes. The pair met again in the Two Thousand, when the Newmarket running was confirmed; and Golden Plover must be ranked as one of those unlucky animals who are destined to land their friends in difficulties. Hitherto they have found excuses for him after each successive defeat, persistently continuing to take the odds, apparently on the principle of better luck next time.

Matters were better arranged this year at Epsom than last season. The meeting was compressed into a couple of days, and it did not clash with the gathering at Sandown. It may be said, on the whole, to have been favoured by the weather; for, although the first day was simply execrable, the second was exceptionally fine. But the number of spectators on Tuesday was small, and would certainly have been smaller had unfortunate amateurs realized all they were destined to undergo. We have seen the Derby run in a June snowstorm; but even in an English May it is happily somewhat unusual to have snow and sleet, with a violent thunderstorm. The course was white when the horses came out of the paddock for the Great Metropolitan Stakes, and the start was delayed besides by the sudden storm which sent the competitors back to shelter. But, if the customary inspection in the paddock was hurried over or altogether neglected, there was comparatively little cause for regret. There was little to be seen in the way of horseflesh that was much worth looking at; and what had promised at one time to be an unusually large field had dwindled down at the last to eight actual starters. It was a poor field, but it was a good race; and an outsider, with 30 to 1 offered against him, won an extremely exciting finish by something like a head. Brown Bess, a five-year-old, who had been rejected from the Fyfield Stable, and came in carrying a feather weight, must probably be content to rest her racing fame on the surprise of the Great Metropolitan Stakes. Those Londoners who indulge themselves in

a spring meeting at Epsom elect for the City and Suburban day as a matter of course; and on Wednesday, having assembled in their thousands, they had every reason to congratulate themselves on the obsequies. It was a big day in every respect; the stand was well filled and the hill was crowded; there was a big field for the great race, and not a few of the horses had great reputations; while the weather was nearly all that could be desired, and infinitely better than could have been expected. As might be supposed, when such rival cracks were to meet as Peter, winner of the Middle Park Plate; Bend Or, winner of the Derby; Potarch, winner of the Two Thousand Guineas; and Prestonpans, winner of the Liverpool Autumn Cup; there was much curiosity as to the result, and there had been strange fluctuations in the betting. "Strange," perhaps, we should hardly say, for among the horses that were most famous few were to be relied on. Peter had been signally beaten at Lincoln, while the Derby winner had disgraced himself in the Leger. Peter carried the top weight of 9 st. 1 lb., and besides some other reasons, to which we do not care to do more than allude, there was enough to explain the violent movements in the betting about him. He had hurt his foot, and been put on the sick-list for a week, and for some days it was understood that he was not intended to start. He did come to the post, and in fair condition; nevertheless, those of his friends who had hedged in time were happy. For he inclined to repeat his Lincoln performance; although, as he got badly away in the miserable start, the chances were greatly against him from the first. The dangerous Buchanan so far shared Peter's ill-luck that he likewise fell from the beginning into the rear ranks; while Petronel, the fortunate winner of the Two Thousand Guineas, who was rather favourably handicapped, getting well away in the front, was fairly beaten on his merits by Bend Or. The triumph of Bend Or, though with his burden of nine stone he seemed to make a liberal concession to so good a horse as Petronel, confirmed the handicapping. He showed in his Derby rather than his Leger form, and Archer helped him past the winning-post, with something to spare. Yet, had the jockeys been transposed, we can have little doubt that Foxhall would have made it a nearer thing, if he had not proved the actual winner. The looks and creditable antecedents of the magnificent American horse amply justified the confidence of his backers, who, we believe, included a considerable proportion of the knowing ones. We are very far from saying that Foxhall was not well ridden. But such a jockey as Archer can afford to give something considerable to a light lad on a powerful animal, pulling double in the crush and scramble over a course so difficult as the Downs. Foxhall, too, by the way, was a sufferer from the weather; for, though there was never anything wrong with his sinewy legs, the east wind had set him coughing for some time. Since the decision of the Epsom events, attention has been concentrated on the Two Thousand Guineas, which was run on Wednesday. In one way the race, that has often been significant, promised to be more exciting than usual, since speculation had seldom been more in the dark. For, besides that exceptional uncertainty in the public performances of the prominent competitors of the season to which we have alluded, the longer the prolongation of the drought, the greater became the risks to the training-stables. It was possible, moreover, that the horses recently engaged, although they had not actually and conspicuously come to grief, might have suffered in some strain that would develop itself afterwards. Peter run at Epsom, though he had been confidently scratched by some of the talent, which is a proof the more, if proof were needed, that common report is not to be trusted. But rumour had been very busy with the names of the earlier favourites for the Two Thousand, and the barometer of the betting showed conclusively that rumour in this case had been generally believed. Lord Falmouth's Bal Gal, who was said to be touched in the wind last year, was reported to be none the better after the winter. Mr. Stirling Crawford's St. Louis was boldly laid against as being lame, which has turned out to be the case, and Mr. Blanton's Scobell had followed suit for a time, although subsequently he started first in the betting. Cameliard, after his feat at Newmarket, Mr. Chaplin's Wandering Nun, who had run a dead heat with Scobell last year at Lewes, and Peregrine, were, upon the whole, as much in favour as anything. To Peregrine, indeed, a certain degree of mystery attached, as this Two Thousand was his first appearance in public. He had been bought last year of the Duke of Westminster for 700 guineas, but was kept in the stable, and it was said by those who ought to know that he had had a highly satisfactory trial with Bend Or. The result seemed to show that those supposed to be in his secrets had acted on safe information, for he came very easily by three lengths before the American Iroquois, and we may hear a good deal more of him before the Derby Day.

REVIEWS.

LIFE OF BISHOP WILBERFORCE.—VOL. II.*

ON the death of Bishop Wilberforce, and again upon the appearance of the first volume of Canon Ashwell's *Life of the Prelate*, we so fully discussed his character and career that it would

* *Life of the Right Reverend Samuel Wilberforce, D.D.* By his Son, Reginald G. Wilberforce. 3 vols. Vol. II. London: John Murray. 1881.

be idle to attempt any general examination in noticing the second volume of his biography which has been brought out by his eldest son, Mr. Reginald Wilberforce. Criticism would naturally be lenient to a work undertaken under circumstances of peculiar difficulty by one standing in such relationship to the subject of the memoir, and belonging to a generation which has practically to accept much of what he describes as ancient history. But, in truth, Mr. Wilberforce is in no need of leniency, for he has shown much ability in performing his task—in particular by the modest consistency with which he constantly effaces himself and makes Bishop Wilberforce speak as far as possible in his own person in letter and in journal, or else receive the confidences of distinguished correspondents whose language throws a reflective light on his own opinions.

Canon Ashwell proceeded on the same principle, but we think that the second biographer has been more happy than his predecessor in letting the reader into the secret of the various phases of a most versatile character. The Wilberforce of the second volume is not always discharging duties. He dines and he breakfasts at Grillon's, and he delights society with his coruscating wit, although, as in one touching passage of his diary where he takes himself to task for a particular occasion when he must have been more than usually brilliant, he sometimes confesses to himself that his reputation grew of the false excitement of a deep and recent sorrow. Moreover, he stands revealed as a keen politician, a Peelite of the Peelites, in that old time when to be a Peelite meant to eschew Radicalism, and Mr. Gladstone, as the Bishop is never tired of recording, was constantly inclining to the Conservatives—ever, it would seem, approaching, yet never joining hands. Mr. Wilberforce may, indeed, fear that in printing his father's outspoken soliloquies over men and things he has here and there come out with a startling opinion upon this or that highly-placed personage who is still living. Such passages are, however, sparsely scattered through the book; while it can do no one any harm to learn that the aversion with which Bishop Wilberforce regarded both Lord John Russell and Lord Palmerston was impartially intense. Of Sir James Graham he speaks in higher terms than have always been bestowed on that statesman, but his model men are Mr. Gladstone and Lord Aberdeen. On the other hand, the good-natured contempt with which he is wont to treat Archbishop Sumner, and his evident want of respect for the opinions of the Metropolitan's brother of Winchester, different as these are from his earlier deference to those dignitaries, exhumed by Canon Ashwell, effectually contradict that myth of a career of unchanged Church views which Mr. Wilberforce very judiciously lets fall into oblivion.

The present volume embraces the Bishop's life from 1848 to 1860, comprising the Bishop's earlier troubles with Mr. Allies and Dr. Pusey, and his later one—thanks to a meddling Mr. Golightly—with Dr. Liddon; the Gorham judgment, followed by the Papal Aggression, aggravated by Lord John Russell's Durham letter, and leading to that Episcopal Declaration from which the signature of Phillpotts was absent, the Crimean war and the first Derby, the Aberdeen, and the first Palmerston Governments, the revival of Convocation, the secessions of his brother-in-law, Archdeacon Manning, and of his brother, Archdeacon Robert Wilberforce, who soon after died, the death of his son Herbert, the Denison prosecution, the building up of his wonderful diocesan organization, the establishment of Cuddesdon College, and the various abortive Church Discipline Bills. Of these topics the narrative of the difficulty with Dr. Pusey might, we think, have been judiciously retrenched; a *précis* would have told all that was wanting without any painful reprinting of letters. It is, happily, a long-forgotten business; blotted out by the subsequent timely reconciliation of the two distinguished men who had been for only a short time painfully pitted against each other. It turned, after all, on considerations of expediency on both sides. The question on one side was the inquiry whether Dr. Pusey was judicious in adapting foreign books of devotion, from which he was unable wholly to exorcise foreign phrases and modes of thought? In so doing we think he was not judicious. But, on the other side, was Bishop Wilberforce judicious in inhibiting for a mere error of judgment such a preacher as Dr. Pusey, when he let so many fledglings, who had far better have been gagged, preach their shallow or erroneous twaddle? As to this question also we have no hesitation in replying that we regard the counterproceeding as injudicious. But at that period (1850) the Bishop had not fully taken up that new position which transferred the eclectic and at one time more than half Low Church disciple of the Sumners into the episcopal assessor of that staid High Churchmanship, of which from the days of Hooker and Andrewes down to those of Hook and Keble, the Church of England has under much provocation from opposing sides upheld and taught.

Mr. Wilberforce supplies a rather amusing incidental illustration of the mental struggles which the Bishop went through before he had completed his mental change which are afforded by certain retrospective confessions—running, as confessions are apt to do, into criticisms of our neighbour's motives—which at the beginning of 1852 the Bishop confided to some of his most confidential correspondents in reviewing his own conduct as well as that of his colleagues in reference to the precipitate advantage which, in his undignified terror, Bishop Blomfield took of Mr. Bennett's ill-advised conditional resignation of his Knightsbridge living, as well as to some kindred events of that distempered period.

In a letter to the Hon. (afterwards Lord) Richard Cavendish of December 26, 1851, the Bishop says, "With the deepest sense of our undeservings, I do think that Gladstone, in spite of his calm and powerful understanding and honest and true heart, shows signs of the natural effect of such continual defamation of the Bishops as the *Morning Chronicle* habitually indulges itself and its readers with." On the same day he writes to Mr. Gladstone, "I think that even you have been biased by the incessant vituperations of the *Morning Chronicle* to deal unfairly with many of the Bishops." We have no doubt that in this vigorous denunciation the Bishop meant to include the vivacious correspondent who was accustomed, with much frequency, to enlighten the *Morning Chronicle* with his views on Church questions under the signature of "D. C. L." Bishop Wilberforce's defence of his order is peculiarly feeble, amounting as it does to a confession of the shortcomings of the Episcopate which he professes to repudiate. We are sure that the *Morning Chronicle* never said anything more bitter than "the miserable episcopal appointments of Lord John": "Lord John Russell's miserable appointments and the fearful weakness caused by the character of the Primato"—namely, Bishop Wilberforce's cousin and former patron, Sumner, once of Chester—and "the weakening of all our just influence by the introduction of such men as Lord John has put amongst us; then of such a primacy," i.e. of a Sumnerian primacy, a paraphrase the significance of which will not be lost to those who recollect Canon Ashwell's volume. In these sentences Bishop Wilberforce has summed up with a directness only possible in private correspondence all which in more vague and less personal language the *Morning Chronicle* or its contributor intended to imply. It would have been impertinent on the part of that newspaper to have sorted the Episcopate according to the Ministers from whom the prelates respectively had got their mitres. As a fact, there was the bench, and that bench did not, as the *Morning Chronicle* believed, show itself strong enough in a very difficult crisis. If it were possible to conceive Dr. Wilberforce in any way involved in this general censure, it would only have been because the current of episcopal trades-unionism created in so great a degree by these miserable appointments may have carried him away. For instance, he joined in signing the unhappy "Rubrical declaration" of the spring of 1851, so justly denounced by Mr. Gladstone in a memorandum of January 1852, which Mr. Wilberforce prints, from which Bishop Phillips, as we have seen, not only held aloof, but wrote that counter declaration as a pastoral to the clergy of his diocese, which still lives by force of its intrinsic merits. Certainly the Bishop of Exeter incurred no vituperation from the *Morning Chronicle*, neither would Bishop Wilberforce have done so had he joined his veteran colleague, with whom he had really so much more in common than with "such men" as those with whom, as we see, he elected to throw in his lot.

We gladly turn from these trifles to the great public achievement of Bishop Wilberforce's episcopate, the revival of the Church's constitutional deliberative assembly, which the biographer sums up in a telling manner, recurring to it from time to time as fresh incidents present themselves, so as to sustain the thread of the narrative. With all the perplexities which beset Churchmen in this eighth decade of our century, the younger of them can have little idea of the cowardly stupidity which less than thirty years since shrouded the eyes alike of prelate and of politician. It was this darkness which Wilberforce had to disperse, and that stupidity which he had to enlighten; and the way in which he set to work brought out the manifold capacities of his large mind as they had never before been developed in isolated duels with clergymen however eminent or however disreputable. The game was by no means easy, for he had to deal with a bench of colleagues of whom in reality he thought, though he could not afford to say so, pretty much as the *Morning Chronicle* did. These, too, were headed by an Archbishop whom he had once worshipped with a boyish enthusiasm, while he had by this time, after painful struggles, seen through the kindly, vacillating, undignified, timidly obstinate, and withal occasionally sly, John Bird Sumner. He had equally to keep well with the various political parties, having obtained his first advantage at the hands of the Government which was not that of his predilections—namely, from Lord Derby and Mr. Walpole. Soon after, when his own special friend and on whom he particularly leaned, Lord Aberdeen, came into power, he found himself very rudely disillusioned by a letter from the Premier's son, Mr. (now Sir) Arthur Gordon, from which we quote the beginning. The "Lord John"—"who made the mischief is a very open secret:—

On my arrival in town I was concerned to find that the opposition to Mr. Gladstone, the visit to Windsor, and, as I cannot but suppose, a conversation with Lord John —, have combined to diminish the favour with which my father was once disposed to regard the Convocation movement, but which has certainly been on the wane for the last few months. We walked up as usual from the office to Argyll House. I began business by saying that you were to be in town on Thursday, but that you had expressed your willingness to come up for the promised interview on any day he might name. He hurriedly replied, "But can I see him? (ought I?) I can't enter into his views, you know. I can't allow them to act." I observed that he himself had invited the interview, and could not well now refuse to hear your arguments. "Very well, very well; but it can't go on—it must be stopped, I tell you." I remarked that I had no reason to believe you desired a long session, but that any direct attempt on the part of the Crown to "stop" it would be a novel proceeding, and would irritate all parties. "I like your 'novel proceeding'; is it not a novel proceeding on their part to hold any but merely formal meetings? Does not this make it high time for novel proceedings on our side? Do you

think I am going to tolerate them by a side wind because the Archbishop is a poor, vain, weak, silly creature whom they can bully with impunity?"

How the Bishop ultimately convinced that cautious but candid Scot, how statesmen were driven to see that, whether they liked Convocation or not, it was better to let it talk than put the gag on lips at Westminster which would out of Westminster make their opinions of their treatment disagreeably notorious, and how, last of all, the Archbishop himself ran to the Minister for permission to hold longer sittings of Convocation, is all capitally told in the book, and we shall not attempt to recapitulate a story which owes much of its interest to its details.

We have pointed out the biographer's constant care to make his father speak for himself; and when Mr. Wilberforce departs from his accustomed reticence and gives vent to a personal impulse, as in the passages in which he dwells upon his father's agony of mind at the secession of his brother Robert, and upon the deep sorrow of his son Herbert's death, he achieves the success, not always attained, of combining deep feeling and excellent taste.

We must note a misprint which will probably pass unnoticed by the younger generation, but which is very rich to those who are old enough to remember the persons whom it recalls. Lord John Russell, so the book makes the Bishop say, told him on January 29, 1859, "at my Reform Bill four prepared it. I, Lord Durham, Dungannon, and Althorpe" (the final e here being a mistake). Many readers will probably say, we know three of this lordly group, but who is "Dungannon"? The Minister who really took a part in the task was Lord Duncannon, son of Lord Bessborough, a pompous man with a high white neckcloth, who was included in the Governments of Lord Grey and Lord Melbourne, and died Lord-Lieutenant of Ireland and Earl of Bessborough in 1847. The person who would in 1859 have been called "Dungannon," though in 1831 he was only Mr. Trevor, was the most bigoted and unyielding of Irish Orange Tories, author of a forgotten *Life of William III.* It is a strange irony of fate that the misprint of a letter should hand the last Lord Dungannon down as one of the authors of the Reform Bill.

The Bishop and his biographer were both mistaken in supposing that he had received the degree of D.C.L. at Cambridge. When Henry VIII. forbade Oxford to teach Canon Law, he spared Cambridge. Consequently that University makes doctors alike of Canon and Civil Law, briefly termed *legum doctores*, or LL.D. Oxford can only produce Doctors of Civil Law, and calls them by English initials D.C.L.

It is a venial fault that, here and there, the book would have been the better for that fulness of illustration which an editor more contemporary with the subject of his biography could have provided. For example, in introducing the narrative of the Bishop's unlucky rencontre thirty-two years ago with Mr. Allies, as to which forgotten scandal within the last two years the world has, with but little advantage, been compelled to hear both sides, Mr. Wilberforce forgot to explain that the peccant Oxfordshire clergyman whom he abruptly projects on our spectrum had been distinguished as a leader of the neo-Newmanian school of Oxford thinkers, as author of a powerful vindication of the Church of England against that of Rome, and as an ex-chaplain of Bishop Blomfield. We cannot better conclude this article than by quoting the eminently wise letter of Baron Alderson, which led to the ultimate settlement of this ill-omened fracas. Had our rulers, both spiritual and temporal, been rather more fully pervaded than they have been during the last thirty years with the spirit of the shrewd old lawyer, the Church of England might have had a very different history to record.

April 28, 1849.

MY DEAR LORD,—A very great affection which I have long felt, and still feel, for Allies must be my excuse for troubling you about him. I was sorry for his book, with which I individually do not agree. Indeed, if I had been consulted by him, I should have advised a great portion of it to be omitted. I agree with you that there are parts very objectionable, but I think it will be very difficult to lay the law's finger upon them. But this is not the point. Supposing that, after a long, tedious, and acrimonious discussion, in which points of minute heterodoxy are ventilated in the Ecclesiastical Court, a successful issue is obtained, and judgment given against Allies—a problematical result, I conscientiously believe—yet at what expense and danger of schism will it be obtained! These Oxonians whose tendencies go towards Rome, as others who have gone towards Geneva, will die out if judiciously left to themselves. They will in the end do good. Wesley woke up the Church from her lethargy and breathed into her an Evangelical spirit. With this great good he did some great harm also. These are correcting the harm by introducing a more Rubrical and formal spirit into the Church, and reviving her discipline, and drawing attention to the real value of her Sacraments and Order. They, like Wesley, are doing harm by running into the opposite extreme. I will only add one word more. I do really believe, and that from good authority, that this proceeding against Allies will produce probably a schism, and will drive out some whom we all, and you especially, would wish most ardently to retain within our Church. And, as to Allies himself, I admit his errors—which I agree are errors—but I would set against them a self-denying life, a liberal spirit, to which money is really as dross, an unimpeachable morality, a great mass of learning, and the having written one of the best books [*The Church of England Cleared from the Charge of Schism*] against the vital principle of Rome—her supremacy. That was a great help to our English Church in the pending controversy. Is it desirable to drive out of the Church such a man? or is it not desirable, by a wise and kind abstinence, and by showing him kindly his errors, or letting them expend themselves noiselessly and without mischief, to retain within our own Church one of its most learned and holy, even if erring, members? With many apologies for this letter, believe me, in all true affection,

Yours,

E. H. ALDERSON.

COX'S MYTHOLOGY AND FOLK-LORE.*

SIR GEORGE COX has returned, with his wonted industry and ingenuity, to the subjects which he treated of in his *Aryan Mythology*, his *Tales of Ancient Greece*, and his *Manual of Mythology*. On this occasion he offers the student an *Introduction to Mythology and Folk-Lore*. The promise of the title is scarcely kept in performance. It is only of Aryan mythology, with glances at Egyptian and Semitic legends, that Sir George Cox has to speak. Again, his volume scarcely touches on folk-lore at all. He examines and weaves into his system some of the *ndrohen*, "folk-tales," if the expression may be used, which are current among European races. But the great mass of story, practice, and belief which is called folk-lore—and which is practically identical in Africa, America, Asia, Europe, and Australia—is not elucidated by our author. Readers, therefore, must not expect too much; they must look for little more than a repetition of explanations of Greek, German, and, generally, of Indo-European mythology. These explanations rest, for the most part, on Professor Max Müller's system, though it seems possible enough that Mr. Müller does not always agree with Sir George Cox. He has, indeed, warned his disciple that there are, in many myths, grains of history which cannot be dissolved by any philological acids. But we find here little notice of the historical element in the myth.

In reviewing Mr. Max Müller's *Selected Essays* a few weeks ago we examined his system in some detail. We need not repeat a task sufficiently arid. To us the system seems deficient in historical evidence, inadequate as an explanation of facts, and frequently inconsistent with itself. To put it briefly, Mr. Müller and Sir George Cox hold that in the mythopœic ages before the Aryan separation, and also after the settlement of the Greeks in Europe, language suffered from its own embarrassing opulence. Objects, especially such objects as the sun, and sky, wind and dawn and storm, had almost as many names as they had attributes. Statements like the following were commonly made when people "passed the time of day," or discussed the weather—"The wise one is just rolling up his golden ball," meaning, the sun is just beginning his daily course. Then many names lost their meaning, while the sayings in which they were imbedded kept their place in language. It came to be thought that the word for "the wise one" was a proper name, and a story was told about him and his ball which became the myth of Sisyphus. We are always obliged to ask for evidence to prove that these philological processes existed in the common talk, not only of undivided Aryans and of early Greeks in Europe, but of Red Indians, Finns, Zulus, Bushmen, Eskimo, Maingaians, and other races whose myths palpably resemble those of European nations. Almost the only evidence we are offered is that of the Vedas, which (being elaborate poetry) do not illustrate the every-day talk of any race whatever, and, being subsequent to the Aryan separation, throw no light whatever on Greek thought and speech at any period. As to the other races, the Vedas, of course, help us still less to understand their mythology. Again, both in Mr. Müller's works and in Sir George Cox's there is a lurking impression which, we are sure, neither writer is consciously affected by, that the ancestors of the Greeks once spoke Sanskrit. Thus Sir George Cox writes (p. 75), "Another Sanskrit name for the morning was Arjuni, the brilliant, but of this word the Greek in his westward journeyings had forgotten the meaning, and Argynnis became for him a beautiful maiden beloved by Agamemnon." Are we wrong in supposing that, in the separation of the Aryan stock, that branch which came to speak Greek broke away and went westward before it had learned to speak Sanskrit, and so could never have known the Sanskrit word Arjuni? Mr. Müller says "no sound scholar would ever think of deriving a Greek or Latin word from Sanskrit." Yet Sir George Cox holds that the Greeks knew and forgot the sense of Sanskrit words. If we are right, philologists can say no more than that roots of words were common to the various families of the Indo-European stock. Now, if the root of Zeus and of Dyaus is common to Greek and Sanskrit, we get no further than that fact. In what sense the undivided Aryans regarded the sky as a god (for there are various stages in the growth of this conception), it is impossible for mortal man to know. But even Mr. Müller says occasionally that the undivided Aryans, of the age when as yet Greek and Sanskrit were not, used Sanskrit words; thus, "the ancient Aryans, before they separated, spoke of Dyu, the sky, and Dyu, the God" (*Lectures on Language*. Second Series, p. 440). Now Dyu is a Sanskrit word, occurring in the Vedas, and retaining a good deal of the sense of "sky." Thus, though no Greek words are to be derived from Sanskrit, the ancestors of the Greeks knew at least two Sanskrit words, *Dyu* and *Arjuni*. We are compelled to suppose that the fault lies in our own want of apprehension, otherwise the consistency of these philological arguments seems disputable.

Out of Sir George Cox's closely printed pages we may select a few myths and examine his explanations. The story of Sisyphus is familiar; Odysseus saw him in Hades, rolling a great stone up a hill, by way of punishment, and, always as he reached the hillcrest, "back once again to the plain rolled the stone, the pitiless thing." This myth, we are told, was known to the primeval Aryan race before it broke up into Hindoos, Greeks, Romans,

Germans, and Celts. We admit that we are unacquainted with the Hindoo, Roman, German, and Celtic versions of the story. Sir George Cox explains thus:—"The tale of Sisyphus resolves itself, in fact, into one or two short sayings." "The wise being is rolling the ball up the heaven." "The great ball is rolling down the heaven." It cannot escape the most feeble intellect that, while the "wise being" is in heaven, Sisyphus is in hell, and that the sun, in point of fact, does not roll down the side of the heaven which he climbed up. The sun succeeds precisely where poor Sisyphus failed. But how do we know that Sisyphus is the sun? Why, thus; *Sisyphos* is taken by Curtius for a reduplicated form of *σοφός* with æolic *v*. Thus Sisyphus means "the wise man." Now, if Sisyphus, or *σοφός*, were an Aryan word before the lamented divisions in the Aryan camp, and if the undivided Aryans did call the sun "the wise man" = Sisyphus, men might have come to forget, in process of time, what their ancestors had meant. And they might have had a story about a wise man rolling a ball. But Sir George Cox must observe that, even if he could prove (which is impossible) that the undivided Aryans called the sun "the wise one," that is, Sisyphus, it would not follow that any hero whose name means "wise" is the sun. We lay no stress on the fact that the sun and Sisyphus do precisely opposite things. But how many unproved hypotheses, when one looks into it, there are in our author's explanation, which concludes with an undistributed middle. In point of fact, the punishment of Sisyphus is a simple invention, like making ropes of sand, filling a sieve with water, and so forth. We must add that Tantalus (p. 89) shares the solar fate of Sisyphus. "Tantalos, in fact, is Phœbos, for he has the wisdom which Phœbos alone possesses." The ground for this assertion seems to be that "Tantalos was admitted to share the secret counsels of Zeus." We do not know how many examples there are of contemporary savage potentates who are "admitted to share the secret counsels of Zeus," that is, who climb a sacred mountain, converse there with the tribal God, and return to give good advice to their people. Homer says much the same of Minos; but Minos, too, is the sun, at least, he "met his end in the distant evening land where the sun goes down. He is killed in Sicily by King Kokalos, the eyeless gloom of night," whose name Sir G. Cox "can scarcely fail to connect with that of Horatius Cocles." A slipshod fiend here tempts us to whisper an allusion to one whose name Captain Burnaby carried, with his pills, into the lands of morning.

We are very greatly tempted to analyse Sir G. Cox's explanation of the myth of Cephalus and Procris. We have traced the story through Apollodorus, Eratosthenes, Antoninus Liberalis, Hyginus, and Ovid. Why does Sir George shrink the older Greek version, in which Minos, not Artemis, gives Procris the spear that never misses, and the dog that nothing can escape, except the fox that no dog can catch? What would he make of these very amazing and unmentionable services which Procris rendered to Minos and Pasiphaë? But his explanation fails to satisfy, chiefly because we get no proof that Cephalus is the sun. The Vedas may have called the sun the "head of light," and Cephalus may mean "head"; but how do these facts bear on the matter? The Greeks knew no more of the Vedas than of the *Pilgrim's Progress*, and the Vedic poets, who called the sun "a head of light," produced no myth about a hero named "Head." The arguments lead to no conclusion. The philological theory always shrinks from admitting any explanation based on law, usage, custom. Thus the known facts of the power of medicine-men, who can fly in the air, turn themselves and others into beasts, converse with gods and with the dead, and are, in their turn, deified, scarcely find a passing mention in the explanations of Sir G. W. Cox. Yet at this moment, in Africa, America, Asia, and Australia, there exist men with all the powers and attributes of Zeus. Like him, they shake the heavens; like him, they mount in the air; like him, they cause rain and fine weather; like him they assume animal forms, and in death they are deified, retaining, as gods, the powers they enjoyed as men. Surely these facts do as much to explain Zeus and other gods (whose tombs were known to the priests) as a derivation from an Aryan root meaning "to beam." Even now men are identified with wind and weather, and are named after the sun and sky they control. Why are these facts overlooked by philological mythologists? The result is to obscure the history of institutions. Thus, Homer speaks with horror of poisoned arrows; but Sir G. W. Cox will not believe that "poisoned arrows were used by any Hellenic tribes." The idea that Odysseus sought them from Ilos, Mercurius's son, and others is derived from an equivocation which turned the violet-tinted rays of morning into poisoned arrows. He has another such explanation of the human sacrifices in Homer. "There is no evidence that Achaean chiefs . . . offered human sacrifices . . . it is easy to see that such stories could not fail to spring up when phrases which had at first denoted the varying actions of the sun were regarded as relating to the deeds and actions of human beings." We are inclined to reply, that there is no evidence to prove that phrases about the actions of the sun were ever regarded as relating to the deeds of human beings; while, as for Greek human sacrifices, we refer Sir George Cox to Grote (i. 124, 125). "Such sacrifices," says Grote, quoting Hermann's *Alterthümer*, "had been a portion of primitive Greek religion, but had gradually become obsolete everywhere, except in one or two solitary cases, which were spoken of with horror." The philological school of mythological interpretation

* *Introduction to Mythology and Folk-Lore*. By the Rev. Sir G. W. Cox, Bart. London: C. Kegan Paul & Co. 1881.

seems to us to invent one stage of the history of the human mind, and then to use the invention to sweep away evidence for the existence of another stage, known to have existed wherever civilization has studied barbarism. But to try to make philologists see this is to undertake the task of Sisyphus.

IRELAND'S TRUE DAUGHTER.*

THE heroine of this story, Marion Burke, may indeed be accounted happy among women. She is, when the book opens, thirty years old, and yet she is blessed with three ardent lovers. One of them of course marries her, the second drowns himself because he cannot have her, while the third dies of grief with all the propriety that becomes a baronet who was now somewhat advanced in years. The man who makes away with himself was, as might be expected, the desperate villain of the piece. By his death he proves the innocence of the injured hero, and hastens on his marriage with the heroine by at least a year, while the broken-hearted baronet was the owner of a fine estate which it was most convenient for the young couple to possess. He made an affecting end, and a no less affecting will, and, having no heirs, left all his property to the virtuous lovers. If Marion was a good deal older than the common run of heroines, yet she had much in her favour. Though she was thirty, yet she did not look more than four-and-twenty; moreover, "she was," we read, "neither too tall nor too short; neither too stout nor too thin. Her walk was dignified and stately, yet at the same time perfectly easy and graceful." If there was one of her features on which she might have prided herself more than on all the rest, it was, it should seem, her nose, for it was "in perfect proportion, with an unmistakable air of good breeding about it." "Every man," to quote a famous German writer, "has his own style, like his own nose"; and to this general rule our heroine was no exception. In her character there is not much that has impressed itself upon our memory, for, to tell the truth, our interest lay not so much in herself as in the dreadful villain, the benevolent but elderly baronet, and the virtuous bank clerk, who were all three at the same time her lovers. Yet we must not forget to put on record one at least of her sayings. She had more than once to cross the sea from Ireland to England. "Despite," we are told, "her heroic efforts and determination to overcome sea-sickness, she was invariably a victim whenever she was on board ship, at which times, to use her own words, 'she retired into private life until upon *terra firma* once more.'"

It is sad to reflect that the peace of so well-balanced a mind should have been for many months greatly disturbed. Yet villains have little respect for the unmistakable air of good breeding that may reside in a nose, or for that patient endurance which enables a woman not only to support the misery of sea-sickness, but even to utter a kind of aphorism which may be a guidance and a comfort to other heroines who are exposed to like torments. Most fortunately she was forewarned of the troubles that awaited her, and, therefore, she was able at once to meet them with that admirable propriety of conduct which she had always hitherto exhibited. The clouds and an old fellow of the name of Patrick were always ready to give her a prophetic warning whenever a prophetic warning was needed. But till the villain had actually come upon the scene and opened the plot, no warnings seem to have been required. He is not long, however, in making his appearance, and, in fact, he strides on to the stage before either of the virtuous lovers has made his entrance. His name is George Lionel. Though the son of a most respectable old General, and to outward appearance a charming man, "he was a depraved, low-minded, unscrupulous licentiate, well-known in the lowest society." The definition of a *licentiate*, according to our author, would seem to be a *licentious person*. If she is right in this, it is not to be wondered at that the Bishops and sound Churchmen in general gravely shake their heads over the steady increase of the number of licentiates among the clergy. Lionel pays Marion a call, but she, with a sense of propriety that was in keeping with her nose, at once went to fetch her father, and did not return to the drawing-room till the visitor had left. He went away incensed with anger, but still more inflamed with love, though she had, as he said, only replied to his compliments by a toss of the head and a curl of the lip. He galloped off to the Castle where he was staying, dismounted as in a dream, went up to his own room, threw himself into a chair, his hands clenched, his face working. She meanwhile had whispered to a little bird that her pet name was Harry. Her whisper was not so low but that it was overheard by Harry Staunton, the hero, who chanced at that moment to have come into the room. With a modesty which well befitted a virtuous bank clerk whose salary was only 150*l.* a year, he at once assumed that it was a certain Captain Harry Dickinson whom she loved. He therefore remained a most inactive lover till, towards the close of the story, he found out his mistake. Lionel, however, regarded him with suspicion, which soon passed into hatred. Licentiate though he was, he had not, however, acquired the art of masking his feelings. We are always reading that his face grew dark, and darker still, and that he looked fierce. At a ball, when he saw the hero and heroine walking towards the supper-table, "his face became livid, he

gnashed his teeth, and, losing all mastery of himself, he rushed wildly up the staircase and locked himself in his own room." At another time he first muttered, and then a horrible smile distorted his features. Next he clenched his fist, and then he balled out a suggestion. As his rival passed him in a carriage he shook his bent fist with a menacing gesture. How he managed to bend his fist we are no way told. He laughed, on one occasion, so hoarse a laugh that he even startled the birds upon the trees. In his features malignity and hatred were depicted, till at last the heroine herself sprang away from him as if he were some loathsome reptile. But we are here anticipating matters, and must return to the prophetic warnings that were given her. One evening she had been talking with Harry about the licentiate, and expressing her dislike of him. The good bank clerk, like the very virtuous young man that he was, had ventured to remonstrate with her and to speak up for the villain. They were at the time driving in a carriage, and a sudden turn in the road showed them a remarkable appearance in the sky:—

Although the sun had set, a mass of lurid red still coloured the sky where he had sunk beneath it, and above this, straight in front of them, stood forth a dark angry cloud with white foamy edges, looking almost like a solid rock, frowning down upon the gorgeous tints below.

Marion started suddenly from her seat, and pointing to the cloud with outstretched arm, she said vehemently:—

"That cloud is to the landscape what George Lionel is to me! He threatens me with some great evil, which I cannot fathom! A dreadful foreboding fills my mind when I think of him."

Harry, of course, assures her that these are foolish fancies, but she and the reader know only too well that there are more things in heaven and earth than are dreamt of in his philosophy. They, therefore, feel greatly relieved when the frowning cloud loses its solidity, and gradually floats away into the general mass around it. She emphatically says that this, too, may be a foreshadowing, and that the great evil which seems to hang over her may be dispelled as the cloud. Twice again does this cloud show itself. On the first of these two occasions she did little more than shudder; but when, towards the close of the second volume, at which time a heroine is always in despair, it a third time appeared, it was almost too much for her. It was a weird, gray-looking mass, that seemed to toss up foamy edges as it rose. "Oh! no! no!" she cried out in her dread and horror; "no, it cannot be." And yet it was! The gong sounded for dinner, but—though we may feel certain that she was famous for her punctuality—she would not go in. The soup might grow cold, but the end of the cloud she must see. Happily a third time it lost its rock-like solidity of form, and vanished like smoke, whilst a faint gleam struggled forth as if to comfort her. She expressed her gratitude to Heaven, and went in to her dinner. There was, by the way, one celestial phenomenon which does not seem to have astonished her in the least; and yet it is of a very surprising nature. On a certain day in July we read that "the evening was sultry, and the sun poured its rays hotly downwards." Such an extraordinary combination of an evening sun and rays poured downwards ought surely to have introduced us to something very much out of the common. We do certainly make the acquaintance of the virtuous baronet; but virtuous baronets happily are not so rare in real life as our novelists generally would lead us to suppose, and scarcely require to be ushered in by a confusion of the laws of nature.

We have not space at our command to recount the forebodings of old Patrick, though they are scarcely less impressive than those given by the cloud. The villain himself has his warnings, though he will not listen to them. He one day sees the very pool in which, two volumes later on, he is to drown himself. The next night he has a dreadful dream. In his sleep he grasps his rival by the throat, he wakes up, a horrible smile comes upon his features, he looks in a mirror and shudders at his ghastly face, he gets up at dawn, goes along the glen to the pool, sees in it his own weird shadow, says "Not yet, not yet!" hears the hum of awakening insects, asks "Am I mad?" and hurries back to his room, only to dress for breakfast and to go on with the execution of his villainous plans. He artfully contrives that the virtuous hero shall be arrested on the charge of stealing a bank-note, and not only arrested, but even convicted. For this, however, the reader and the heroine had been prepared, as old Patrick had learnt in a dream that Harry would have to go to gaol. This venerable old dreamer soon sees, however, in the coals that leap out of the fire a coffin and a purse. The respectable baronet proposes to the heroine, is refused, and dies of grief. Leaving as he does all his property to the persecuted lovers, he not only greatly aids in getting them out of their difficulties, but also he confirms the faith that is placed in pieces of hot coal. The villain, now that he has his rival locked up in Newgate, hastens over to Ireland, and also proposes. Being refused, he hands the heroine a letter which he had written beforehand, containing a full confession of his guilt, and with the most obliging despatch hurries once more up the glen and drowns himself. The hero is with all speed released, and not only gains the hand of the heroine and the fortune of the broken-hearted baronet, but on the very day that he leaves Newgate is made a partner by the banker who had so lately prosecuted him on a charge of theft. Old Patrick renders one more service. He is consulted by the police officers who were in pursuit of the villain. Guided by his mystical lore, they drag the darksome pool and find the body of the once charming licentiate.

GERVASE OF CANTERBURY.*

IN his preface to the second volume of the works of the monk Gervase, Dr. Stubbs confines himself to questions relating to their authorship, to the order in which they were produced, and to the historical value of each. On the history of the age of Gervase and the literary character of his contemporaries, he reminds his readers that he has already said nearly all that he had to say in the prefaces to previous works prepared by him for publication under the direction of the late and present Masters of the Rolls. Of the personal life of Gervase, and of the circumstances which impelled a man with little of the historical instinct in him to undertake the historian's office, we have as complete an account as it is possible to bring together in Dr. Stubbs's preface to the first volume of the works of Gervase, on which we have made some remarks in this *Review* (May 1, 1880). In that preface Dr. Stubbs had said that but for the great controversy between the monks of Christ Church and the archbishops, Gervase would probably have lived and died as nameless as any others of the unknown members of the community. That he had a profound reverence for St. Thomas of Canterbury, at whose feet he made his monastic profession, is plain from every sentence in which he speaks of him; but he allowed a long series of years to pass away after the Archbishop's murder before he took pen in hand, and when he did so his memory was not so trustworthy as it might have been, and thus probably he was the more ready to adopt the words of others, even in the narrative of events of which he was himself a contemporary witness. But the great quarrel with Archbishop Baldwin stirred his deepest feelings as a monk; and the history which he was thus incited to commit to paper was expanded into a narrative of affairs generally to the death of Richard I. From that point he intended to continue his work into the reign of John in the second book of his Chronicle; but this book either was not written or has been lost, and Dr. Stubbs regards the expression of Gervase respecting the lessons which, "by the Grace of God," may be drawn from the story of that book, as some evidence that it was not written at all.

But although his greater work was not carried on, Gervase betook himself to the composition of some minor chronicles and other writings; and these are published in the present volume. Departing in one instance from the order in which they are found in the manuscript followed in this volume, Dr. Stubbs places at the end instead of at the beginning the *Mappa Mundi*, or tract on the ecclesiastical and political geography of Britain. He thus gives first the smaller chronicle intitled *Gesta Regum*, with the continuation of this chronicle from the reign of John to that of Edward I. Of the manuscript, of which the editor speaks as "one of the precious and unique treasures placed by Archbishop Parker in the library of Corpus Christi College, Cambridge," no portion is from the hand of Gervase himself. The work of transcription was, he thinks, begun about the year 1260; but the handiwork of the first scribe, who wrote out also the *Mappa Mundi* and the *Actus Pontificum*, or Lives of the Archbishops, ceases in the chronicle about the year 1262, the penmanship of the MS. for the next sixteen years being in a very inferior style. From 1278 onwards the writing improves, and this portion is given in single columns, all the previous parts having been written in double columns.

The fashion which almost made it necessary for a chronicler to start from the Creation or from the days of Adam, Noah, or Brutus, filled a certain amount of space in each work with rubbish; and when he came down to times for which there might be some genuine historical evidence, the value of his work depended entirely on the quality of the evidence at his command. The really important part of each work is that in which the writer speaks of events which have either passed under his own knowledge or have been learnt from the testimony of contemporary witnesses. Thus the first part of the lesser chronicle of Gervase reproduces the fictions of Geoffrey of Monmouth, making them less attractive by the omission, here and there, of words necessary to the sense, and, as the editor remarks, thus showing "that the compiler did not bestow on this portion of his work more attention than it deserved." The chronicle thus begun Dr. Stubbs divides into three portions, the first ending with the close of the reign of Richard I., and, in his opinion, unquestionably the work of Gervase; the second continues the history through the first eleven years of the reign of John, and this also he thinks may have been written by Gervase, "although the evidence that such was the case is rather inferential and circumstantial than direct, and the conclusion cannot be preemptorily stated." The narrative in the sequel from 1207 to the end was beyond doubt not the work of Gervase.

For the history of the English invasion and of the times which followed it, Gervase betook himself chiefly to William of Malmesbury; and this narrative seems with the previous history to have had an independent circulation. At the least, in Dr. Stubbs's words, "they were made the basis of an historical work, and continued by another writer or writers to the age of Richard II.;" and a copy of this work, preserved in the Library of Trinity College, Cambridge, was read by Leland, who ascribed the middle as well as the earlier portion of the work to Gervase, and gave as from

Gervase large extracts, which come really from John of London or some intermediate writer. Owing to this error of Leland, these extracts, which are not the composition of the monk of Canterbury, are better known than the original work. The narrative of events from the Norman Conquest to the accession of Stephen Dr. Stubbs treats as the third section of Gervase's lesser chronicle. With a few words taken from his larger chronicle, it is mainly an abstract from William of Malmesbury, interspersed with passages from Florence of Worcester and his continuator for the reign of Henry I. The next section, which carries the narrative to the death of Richard I., is a more abridgment of the larger chronicle; and of all these sections Dr. Stubbs regards the historical value as very small, "serving merely to illustrate the author's method of working and to establish the identity of Gervase of Canterbury as the writer of the other works known under his name."

An examination of the *Gesta Regum* for the reign of John brings Dr. Stubbs to the conclusion that the pen of Gervase dropped from his hand when he had completed his entry for the year 1206; and his reasons, beyond doubt, close the question. The passage from the reign of Richard to that of his brother is marked by no change of treatment, nor is there any overlapping of the narrative, while one expression (*prefectus Angliæ*, to denote the justiciar) peculiar to Gervase is carried on into the chronicle of John's reign. Having entered fully into the controversies and wrongs of the monks in his larger chronicle, Gervase passes them by here almost in silence. A new hand would certainly have dwelt largely on the quarrel with Langton, "the absorbing topic of the period." But the writer for 1210, as Dr. Stubbs remarks, tells briefly the story of John's Welsh and Irish successes, and brings his tale to an end with the identification of John as the sixth king of Merlin's prophecy. The writer of the next paragraph goes back three years to record events which had been taken for granted by the previous chronicler, and speaks of Geoffrey FitzPeter, who with Gervase would have been *prefectus Angliæ*, as *justitiarius*. We may look upon it, then, as proved that Gervase is the author of the *Gesta Regum* to the year 1210; but there remains still the question whether this smaller chronicle was or was not an abridgment of a larger work, which he expressed his intention of writing as a continuation of his larger chronicle. Dr. Stubbs, as we have seen, had already given reasons for the belief that this continuation on the larger scale was never written. He notices here the further fact that the great French chronicle of Canterbury known as the *Polistorie*, having followed the longer chronicle to the death of Richard, follows the minor chronicle for the reign of John without any indication that the writer had before him any other continuation of the greater chronicle. Nor has he failed to notice that in the *Polistorie*, as in the *Gesta*, there is a change of treatment at the date 1210.

The narrative of the first ten years of John's reign by Gervase fills scarcely fourteen pages of Dr. Stubbs's second volume; but it is, nevertheless, of high historical value, as giving one or two facts not recorded elsewhere, and as furnishing important particulars of others. As an instance of the former, Dr. Stubbs cites the mission of the Abbot of Casamari as mediator between John and Philip in 1203, while, for the latter he refers to the account given of the extraordinary measures for defence and anticipation of invasion taken by John in 1205, with the very valuable document of instructions for the appointment and conduct of constables, and also to Gervase's record of the fact

that the same year in a great Council at Oxford John was compelled to swear to maintain the rights of the kingdom, an anticipation of the submission at Runnymede which seems to have eluded the pertinacious and somewhat malignant curiosity of Matthew Paris.

As there is not the smallest ground for supposing that Gervase wrote any part of the *Gesta* subsequent to the passage in which John is spoken of as the sixth king of Merlin's prophecy, it follows that we are indebted for the sequel to other hands. But who these may have been it seems impossible to say. The narrative is anonymous; it is a compilation mixed with original notes, and it is the production of a succession of compilers; but in these particulars it is, in Dr. Stubbs's words, "no exception to the general rule of the monastic annals." The materials thus brought together vary indefinitely in value. For the three years, 1238-1241, we have the story of the quarrel between Archbishop Edmund and the Christ Church monks spread over more than fifty tedious pages. But, although this lavish fulness of ecclesiastical details has shut out the wider national history of the time altogether, the letters which follow on the election of his successor are in many respects important. With these is given the Bull by which Innocent IV. appoints Boniface of Savoy to the archiepiscopal see. The document takes a noteworthy place in the history of papal assumptions, as in it

the Pope invests his nominee with the temporalities as well as the spiritualities of the see, in a way which was very unusual for several years after this date, and which under the rule of Edward I. gave occasion for some stringent measures of defence on the part of the crown and the national church.

For a period of thirty years, 1240-1270, there is a close correspondence between the continuation of the lesser chronicle of Gervase and the annals of St. Martin's, Dover. The latter, unfortunately, have been so injured by fire that they cannot be read consecutively, or edited with any approach to completeness. But Dr. Stubbs has compared them so far as to determine not only

* *The Historical Works of Gervase of Canterbury*. Vol. II. Edited by William Stubbs, D.D., under the direction of the Master of the Rolls. London: Longmans & Co. 1880.

their close agreement, but also the fact that each contains valuable information which is not to be found in the other.

The Dover annals [Dr. Stubbs tells us] contain copies of the *Mise of Amiens* and of the challenges interchanged before the battle of Lewes: the continuation of Gervase contains the great protest of the bishops in July 1264. The continuator has not given the challenges, the annalist has not preserved the protest. And as the protest is nowhere else to be found, the balance of value inclines to the continuator. But this is not always the case; the superiority of the Dover text is in many passages very great, so great as to show that not even the preservation of the sister volume is at all compensation for the hopeless injury of the Dover Annals. No doubt this common portion of the two works is the most valuable addition to our knowledge of history that this volume contains. It sheds great light both on the barons' war itself, and on the way in which the struggle was regarded in the monasteries, and especially in the county of Kent.

The existence of other histories which possessed a certain amount of matter, more or less, in common with the continuation of Gervase, is proved by passages which Wharton cites from two works, one of which he calls *Annales Insignes*, while he speaks of the other as *Chronicon Ecclesie Christi Cantuariensis*. Both these works, it seems, have disappeared. The latter was, we are told, in the possession of Archbishop Sancroft; but it cannot be found now at Lambeth, nor is it amongst Sancroft's MSS. at the Bodleian. All, it would seem, that can be said further is that Wharton's expressions leave no room for the notion that the *Annales Insignes* and the *Chronicon* may have been the same work, and that the search for both has been thus far fruitless. But although some questions as to priority of composition may thus be left open, there is no ground for supposing that they were more distinctly original than the continuation of Gervase; and, as Dr. Stubbs remarks, "nothing that may be hereafter discovered can detract from the fact that the penmanship of our MS. is contemporary with the events which it records."

It is scarcely necessary to say that Dr. Stubbs's examinations of the *Actus Pontificum* and *Mappa Mundi* of Gervase are as full and searching as his examination of the *Gesta Regum* with the continuation. The chronicles reproduced in this volume are full of interest; and the preface is a monument of marvellously exact learning and the most conscientious care.

THROUGH AMERICA.*

THERE is a certain class of books of travel, of which this is one, for which the reviewer may very safely predict a certain measure of success. They are not, it is true, good books; they answer none of the questions which intelligent readers ask concerning foreign countries; their authors seem ignorant of politics, constitutions, social aspects, the prospects of the countries of which they write, their leanings, tendencies, dangers, and safeguards. They are gifted by nature with minds which inquire into none of these things. They behold the present; they are satisfied with the outward seeming. They travel in a spirit which can hardly be called appreciative, because to appreciate rightly one must compare; and they cannot compare; nor can it be called statistical, though that sounds fine; it is a spirit which is, in fact, the exact opposite of the critical attitude; it is, perhaps, best expressed by a homely word—it is a "gauping" spirit. If one follows a group of visitors, for instance, about a cathedral, and if he looks round him while the vergier tells his flock that the church is 401 feet long and the tower 140 feet high, he will immediately recognize among the listeners specimens of the class for whom Mr. Marshall has written this book. The "gaupers" are those who love the figures; they are overwhelmed with facts, though they do not know the length of any other church in the world, and it would be exactly the same to them if the vergier had said four thousand feet. And they weary not of architectural details, although they understand no more of Early English, Decorated, and Norman than of Hebrew and of Greek. And their happiness is unbounded when they climb up to the top of the tower, and are told that from that great height they can see over seven counties at once. To see seven counties at once induces a kind of rapture. Such travellers, again, may be seen going over great houses, delighted beyond measure at hearing of the number of servants kept, the cost of the building, the rental of the owner, and, if they are happy enough to get the information, the number of gallons of milk taken in daily at the back-door.

It is to such readers and such travellers that Mr. Marshall has addressed himself. He has produced a book which, though it is long, contains a greater number of figures, in proportion to its length, than any other book we ever remember to have seen, except a cash-book. Possibly some volume of the Transactions of the Statistical Society might be found to equal it in this respect, but it would be rash to expect so much. It bristles with figures; it is like an elementary book of arithmetic, or a table of logarithms, or a meteorological return. Opening the book at random, we find, for instance, that at a certain hotel—it matters not where, because another equally big will be described on the next page—there are 65,000 square feet of stone and 7,000,000 bricks; that it has a frontage of 750 feet; the entrance-hall is 100 feet by 60; the grand reception-room is 100 feet by

24; the dining-hall is 130 feet by 30; and the kitchen 140 feet by 60. After glancing at measurements, which convey no real information, because the number of bricks used for a house is a thing known only to the conscience of a builder, the ordinary reader wonders mildly how big the thing is, and goes on to the next page, where he will find the dimensions of something else. But the man for whom Mr. Marshall writes is actually made happier by the knowledge that a building exists upon this world of miserably small houses which has taken 65,000 square feet and seven—actually, seven millions of bricks. This spirit is carried resolutely through the whole work. We are given the exact number of oysters eaten—of course the author, knowing his public, says "consumed"—in New York every year; we get the measurements of Stewart's big shop; the number of people—"as many as three hundred, sir"—who have sat down, all at once, at Delmonico's; the amount of beer brewed annually in New York; the amount of beef daily eaten at a big girls' school; the cost of all the public buildings; the number of tons of water—in millions—which are poured hourly over the Niagara precipice. How many tons of water—say, rather, gallons of water—can the human mind grasp at once? Of course the author does not really rise to his highest and best until he gets to Chicago, which is pre-eminently a place formed by the Americans for the delight of such a traveller. It was once so little and it is now so big; it once had such a big fire—Mr. Marshall gives us all the statistics of that fire, every one; it slaughters such a prodigious quantity of hogs; it furnishes materials for so many rows of figures, almost all in millions; and it enables an author to hurl so many facts at the heads of his readers that the most insatiable must be satisfied. For posterity, indeed, Mr. Marshall promises figures much more stupendous, much longer rows of numbers, much more overpowering facts. "America," he remarks, with surprising originality, "is still in her infancy." In her adolescence she will cover the whole ocean, probably, with bacon-loaded ships. Even in the important matter of dinner the author is not critical; he speaks of a dinner "aboard" a Pullman Car as "the highest pitch of luxury," and he copies the menu, inviting us to marvel with him. We cannot; the bill of fare is pretentious; but there are travellers who have been known to assert that dinner on the Pacific Railway is generally badly cooked and indigestible, and that wines and drinks of all kinds are bad and dear. Out of the windows of that car Mr. Marshall first beheld the prairie, and this gives him the opportunity of lugging in a quotation from Sir Charles Dilke, which will delight his admirers almost as much as the number of bricks in the hotel. It is that "you could put the whole of India twice over" into the plains and plateau of the States. What, we would ask, does this convey to the ordinary reader? Can he "perceive the breadth of the earth"? Has he grasped the size of India? It would be quite as much to the purpose if Mr. Marshall was to measure the length and breadth of his back-garden, and tell us (in millions) how many back-gardens go to the plains of North America.

And so on through four hundred long pages and over miles of ground which have been described again and again by travellers lively and travellers dull, travellers in search of the picturesque and travellers in search of game. Mr. Marshall has been nowhere off the beaten track, has seen nothing which others have not seen before him, and does not seem capable of seeing anything that is not pointed out in a guide-book. Some people, however, cannot even see what they are there told to see, so that Mr. Marshall is superior as a traveller to a certain number of his fellow-creatures. We go to the Yosemite Valley, and we are told, of course, the depth of every waterfall, the height of every rock. As regards the giant trees, the author would be unhappy—and so would his readers—if he were to dock those trees of a single foot of height. But a book which is all measurements and statistics cannot, except to the class we have already named, be interesting. We do not want to know the cost of a town-hall, or the dimensions of an hotel; and, when there is anything worth talking about, our author breaks down from sheer want of descriptive power. Thus, when Mr. Marshall gets to Niagara, which he afterwards with kind condescension speaks of as "justly world-renowned for its immense and powerful cataracts," he begins by frankly "owning up" that he cannot describe the place. Unfortunately he goes on to prove this assertion. That writer can hardly be said to rise to the majesty of the situation who can get no further than to speak of the roar of the waters as "thundering and deadening"; "hollow and deadening"—what does the roar deaden?—and "loud and thundering, yet so soft, so mellow, so permeating." By the last mysterious adjectives we can only suppose that Mr. Marshall means a soft and mellow roar which goes through, or "permeates," one ear and out of the other.

The value of the book, if it has any value, lies in the chapter on Mormonism. We believe that there has been a pretty general opinion of late, and especially since the death of Brigham Young, that the religion was rapidly dying out. The invasion of Gentiles, the spread of education, the ridicule which has been heaped upon the pretended history of their sacred book, the exposure of the miseries endured by the unhappy emigrants who have gone to the land of Alkali under the delusion that it is, in the matter of milk and honey, even superior to Canaan, have led the world to believe that the religion was fast declining. According to Mr. Marshall—and this is about the only deduction he ventures to draw from his figures—Mormonism was never so prosperous,

* *Through America; or, Nine Months in the United States.* By W. G. Marshall, M.A. London: Sampson Low & Co. 1881.

"in a quiet way," as it is at present. Recruits from Great Britain and other countries continue to pour into Utah by hundreds every two or three months; very few converts are obtained from the States and Canada; but it is in England, Scotland, Wales, Denmark, Sweden, and Norway that the Mormons seek and win their converts, and their chief recruiting-ground is Wales. They are said to dwell less upon the doctrines of their Church than upon the chances offered to converts of bettering their condition. Zion is rich, virtuous, and happy; everything is managed for the people; all previous sins are forgiven; poverty, discontent, and vice are unknown. A rude awakening awaits the unfortunate settler. He is planted in a barren desert, the soil of which has to be irrigated and prepared before anything will grow; he is kept poor by his forced contributions to the Church; he is denied the right of opinion or of speech; he is subject to the most miserable of all oppressions—that of a greedy and ignorant priesthood. And yet, strange to say, the religion does not seem to lose its converts; those who join the Mormons seldom have the courage, or even the wish, to leave them; and the strongest supporters of their "peculiar institution" are said to be the women. Probably the hymns in which the wives celebrate the joys of polygamy are written by their husbands, and ordained by the bishops to be sung "in Quires and Places where they sing"; and the speeches in which strong-minded Mormon women defend the practice, and glory in being "one among many," are also, no doubt, inspired by the governing body. One fact, if it is true, is ominous; not only are nine-tenths of the Utah people Mormons, but the faith is spreading over Idaho and Wyoming; while there are Mormon colonies in New Mexico, Tennessee, Georgia, and other Southern States. A wholesale conversion of the negroes to Mormonism, which is considered not impossible, might produce startling results. Meantime, the Mormons are extremely anxious to get Utah admitted into the Union as a State. The reason of this is, of course, that the majority—that is, the Mormons themselves—by means of their leaders, would govern the State as they pleased. The next step would be to divide Utah, which is as big as England and France put together, into two Mormon States. Meanwhile, Idaho, Wyoming, Arizona, and New Mexico would have been chiefly colonized by Mormons, and would be ready to be formed into States in their turn, thus forming six compact Mormon States. It is most earnestly to be hoped that this scheme will not be allowed to be carried out.

As regards the illustrations, they are numerous, and are all taken from photographs. Those of the buildings resemble the drawings in the illustrated books of advertisements which lie about on hotel tables; those of landscapes, big trees, and other things, are tolerable, but not striking; they want softness and colour. The curious may read in the Appendix Brigham Young's will. It appears, unless we have counted wrong, that he left forty-six children to lament his loss. This seems a large-sized family, but perhaps it will be surpassed as America, "which is still in her infancy," goes on, and Mormonism prospers.

THE LUSIADS.*

CAPTAIN BURTON gives his reasons for publishing this new translation of *The Lusads* in his preface, and with that frankness of self-appreciation with which we are all familiar, "after all," he says, "to speak without undue modesty, my most cogent reason for printing this translation of my master is simply because I prefer it to all that have appeared." The work was undertaken in the course of his travels as "a talisman against homesickness and the nervous troubles which learned men call phrenalgia and autophobia." Camoens has been Captain Burton's companion, consoler, and friend—"on board raft and canoe, sailer and steamer, on the camel and the mule, under the tent and the jungle-tree, upon the fire peak and the snow peak, on the Prairie, the Campo, the Steppe, the Desert." We may congratulate Captain Burton very sincerely on having found such a friend, and yet venture to doubt the necessity of publishing this translation. We are already very amply supplied with renderings of Camoens which remain unread. He has been translated almost as often as if he were a Greek classic, and more frequently than either Dante or Tasso, and yet his poem has been judged to be inferior to the *Jerusalem Delivered*, while even Captain Burton would scarcely think of comparing it to the *Divine Comedy*. Neither can its popularity among English translators, for we doubt whether the poem has ever had many readers out of Portugal, be due to its claim to be considered an "Epos of Commerce." The voyage of Gama and the discovery of India are quite subordinate. Captain Burton speaks with enthusiasm of the "exactness"—"the insight we call introversion"—shown by the "arch-poet of Portugal" in his descriptions of places; but, as a matter of fact, Camoens, like all the men of his century when dealing with nature, is very little given to describing in detail. All the places touched on by Gama's fleet do not occupy so much space as the Island of Love in the Epic; and when Captain Burton, after saying that only a "traveller can do justice to a traveller," goes on to say that he is familiar

with the places mentioned in *The Lusads*, we conclude he does not number that "earthly paradise" among them. The stock classical machinery of the Renaissance poets never looked more absurdly out of place than in the work of this Portuguese Catholic. The absurdity is at its height when Gama prays to the "God of Israel" in a storm raised by the sea-gods at the request of Bacchus, and his prayer is answered by the appearance of Venus and her nymphs. All literature cannot show a finer example of the power of tradition and routine. But, although *The Lusads* is not an epic of commerce, nor indeed an epic at all, its reputation is of easy explanation. Its style is exquisite, flowing, and natural; the historical episodes are full of a lofty patriotic spirit; and, above all, it is the work which, to the foreign reader, forms the literature of Portugal.

We were by no means sure that there was any necessity for another translation of *The Lusads* from anybody after the excellent rendering given by Mr. J. J. Aubertin no more than three years ago, and our opinion has not been changed by an examination of Captain Burton's. We approach the work, however, with some awe, for we have the most explicit warning both from the editor, Mrs. Burton, and from Captain Burton himself as to its true value. Speaking, as he promises to do, "without undue modesty," the translator ends up his preface with the following sentence:—"If a concurrence of adverse triles prevent my being appreciated now, the day will come, haply somewhat late, when men will praise what they now pass by." Thus Captain Burton, speaking from Cairo on May 1, 1880. The confirmatory testimony of the editor is emphatic, and promptly given from Trieste on the following July. Mrs. Burton has some doubts about the fate of the translation, but none as to its value:—"To the un-aesthetic, to non-poets, non-linguists, non-musicians, non-artists, Burton's *Lusads* will be an unknown land, an unknown tongue. One might as well expect them to enjoy a dominant seventh or an enharmonic change in harmony." In short, this "great work" will probably prove "too aesthetic for the British public." However, we venture to state a few of the reasons why we do not prefer Captain Burton's version of *The Lusads* to "the commoner translations." But, before doing so we should like to clear up a little mystery which hangs over the book. Both translator and editor speak of a commentary which is to interest "all alike," whether they be capable of appreciating a dominant seventh or not; but on examination of the two volumes published, such a commentary "nowhere discloses itself." Neither is there any promise of a third volume. Are we to have it afterwards? Or has Captain Burton changed his mind? Or are we only to have it if we show ourselves capable of appreciating "his enharmonic changes in harmony"? The few foot-notes scattered up and down the two volumes are intended to save the reader "the mortification of consulting the conclusion," which is fortunate, as it is not there to consult. The quality of these notes may perhaps console the reader for the absence of the commentary. They are few, trivial, and only explain what is already clear as daylight. In one case we have a note, apparently inserted to justify a pedantic interpolation in the text of the original, and in one Captain Burton has availed himself of the "liberty of foot-notes" to make a rather odd historical mistake. He has contrived to confound Ferdinand the Catholic of Arragon with his ancestor Ferdinand the Saint of Castile, the conqueror of Seville and Córdoba.

The translator of Bouterwek's *History of Portuguese Literature* takes care to point out in a note that the English translator who wishes to render *The Lusads* "must avoid all antiquated and uncommon turns of expressions, for the language of Camoens is always eloquent and modern." No one who has the slightest knowledge of Portuguese will doubt that she is perfectly right. Now, it may be said to be the best definition of Captain Burton's work that he has carefully violated this rule wherever it was possible to do so. His style is affected and extravagant; indeed, it would appear from the editor's preface that he has laboured throughout under a mistaken notion of the task which he had before him. In mentioning previous translations, Mrs. Burton tells us that the best is Fanshawe's, because it is the quaintest. Now, apart from the fact that Fanshawe is very inaccurate, and never scrupled to add whole sentences of his own, his very quaintness unfits him to be the translator of a poet who is the standard of purity of language in his country. Camoens is never quaint. Captain Burton sometimes uses curiously antiquated words to find equivalents for the simplest Portuguese words. The poet is made to talk of raising "an assured esperance." We have "peregrine" for strange, "peon" for a foot-soldier, and so on. Captain Burton makes use also of provincial terms, of Irish, of Lowland Scotch, or of scientific words. "Pilled and plundered" is tautological and inaccurate as a translation of *munda e come*; and, though "dour," "gars," "galore," "kinky," and fifty more which may be found in this translation are in use, they are not the proper equivalents for classic Portuguese. Where the difficulty of making his line contain no more than the necessary number of syllables presses very hard on him, Captain Burton has recourse to using different forms of the same word. He uses "sprite" and "spirit" in the same sense in the same line; Sur-rasin and Sar-racene, Portingall, Portugall, Port'gall, and Portuguezes sometimes in the same stanza. In one place we have "sans peur" as the translation of *sem pavor*. One of his most familiar contrivances for making the rhyme which he cannot find is to lop off a syllable which is in his way, and we have 'gins

* On *Lusads* (*The Lusads*). Englished by R. F. Burton. Edited by his Wife, Isabel Burton. 2 vols. London: Bernard Quaritch. 1880.

'venge, 'campment, 'trenchment, and the monstrosity of squad for squadron (of vessels), given as examples of how "the disciple has faithfully followed his master," "Portugal's Maro."

In spite, or rather in consequence, of his misuse of words, Captain Burton is far from being as accurate as Mr. Aubertin, and is altogether inferior to him in the harmony of his verse. Although not without occasional passages of happy melody, his stanzas are, as a rule, somewhat rugged and halting. Among the eleven hundred and odd stanzas of the poem, a large minority are no better than the two we quote here:—

Passeth no tedious time, before the great
Prince a dure Siege in Guimaraens dree'd
by pawing pow'r, for to 'mend his state,
came the fell enemy, full of grief and greed;
but when committed life to direful Fate,
Egas, the faithful guardian he was free'd,
who had in any other way been lost
all unprepared 'gainst such 'whelming host.
But when the loyal vassal well hath known
how weak his monarch's arm to front such sight,
sans order wending to the Spanish fane
his sovran's homage he doth pledge and plight,
Straight from the horrid siege th' invader flown
trusting the word and honour of the Knight,
Egas Moniz: But now the noble breast
of the brave youth disdaineth strange behest.

Perhaps it is because we cannot appreciate the dominant seventh or an enharmonic change in harmony that these stanzas, and the many others like them, appear to us to be indifferent English in a limping metre. Portuguese is so little known in England that we can scarcely ask our readers to compare these stanzas with the original; but if any one wishes to understand how they differ from it, he can gain a very fair idea by comparing them with the corresponding stanzas—the thirty-fifth and thirty-sixth of the Third Canto in Mr. Aubertin's translation. We have said, however, that Captain Burton's translation is not without passages of happy melody, and we prefer to part from him by quoting one in which we find some pleasure in thinking the expression of a personal feeling has made him surpass himself and distance his competitors, while he is more than usually faithful to his original:—

The joy one's own dear Land once more to view,
sweet home and kith and kin to sight again,
with whom old voyage-feats we face anew,
and tall of climates strange and stranger men;
to taste the honey'd draught of praises due
by long misadventures, toil, and ill and pain,
each bath of pleasure such a perfect store,
the shallow vessel of man's heart brims o'er.

STEVENS'S MADAME DE STAËL.*

DR. STEVENS has attempted what we fear is a hopeless task; that of not only reawakening public interest in Mme. de Staël, but of reviving and extending the dead *culte* of "the greatest woman in literature." He is an adorer, and his two volumes are an elaborate invitation to the world to come and worship with him. Certainly he has some qualifications not always possessed by devotees; he has worked hard to find out all that is to be known about the object of his pious interest. He has drawn up a goodly list of the biographies, criticisms, and more or less indirect accounts of Mme. de Staël that have appeared in French, German, and English; and all these he seems to have read and to have found wanting. Moreover, writing as he does from Geneva, he has had access to some new materials, traditional in certain Genevese families, and especially to the MS. *souvenirs* of M. Pictet de Sergy, one of a well-known Swiss family, himself an intimate friend, and the son and son-in-law of intimate friends, of Mme. de Staël and her father. We may be allowed to hope that these unpublished papers will some day see the light, for they are sure to be full of interesting gossip, and they will certainly not be more one-sided than Dr. Stevens's own work. We give one of the passages which he quotes from them; a passage interesting both from the manner in which it illustrates the position and character of Necker's daughter, and from the explanation it gives of one of her celebrated heroines:—

She not only commemorated some of her associates in the characters of the book [Delphine], but (writes one of her still surviving friends) "the origin of its title is equally worthy of interest." She was desirous of meeting the First Consul, for some urgent reason, and went to the villa of Madame de Montesson, whither he frequently resorted. "She was alone in one of the *salles* when he arrived, accompanied by the consular court of brilliant young women. The latter knew the growing hostility of their master towards her, and passed, without noticing her, to the other end of the *salle*, leaving her entirely alone. She was thus placed in quarantine, and her position was becoming extremely painful, when a young lady, more courageous and more compassionate than her companions, crossed the *salle* and took a seat by her side. Madame de Staël was touched by this kindness, and, in the course of the conversation, asked for her Christian name. "Delphine," she responded. "Ah, I will try to immortalise it," exclaimed Madame de Staël; and she kept her word. This sensible young lady was the Comtesse de Custine.

The author treats Mme. de Staël as a public character, and

consequently his book is not a "Life," but a "Life and Times." This is inevitable, and the pages which Dr. Stevens has devoted to his heroine's surroundings, to the political and literary people with whom she was brought in contact, are perhaps the most interesting, and are certainly the least debatable, in the volumes. Everybody will be glad to read a page or two about Bonstetten, and the young Sismondi, and Mme. de Krüdner, and the historian Von Müller, and will find such digressions a pleasant relief from the monotonous panegyric of the main narrative. Their fault is that they are introduced in a haphazard way, and that the book in consequence makes a kind of patchy impression upon the mind. Moreover, the enthusiasm of the biographer for his chief subject seems to overflow upon her friends, all of whom appear before the reader in somewhat magnificent intellectual proportions. Of Mme. de Krüdner, when she becomes serious, we hear that "her superior intelligence, her rare faculties, seemed intensified by a new moral force, a spiritual magnetism, which drew around her the highest minds"; of Bonstetten, that he was "prodigious as a thinker"; that he was "a sage"; and that he became "an oracle at Coppet"; of Mme. Necker de Saussure that she was "the pride of Geneva," rich in heart and brain, and so on of all the rest. No doubt all these were remarkable people, but Dr. Stevens has not practised the art of letting the story suggest their superiority. He forces it upon the reader. He will have no society that is not of the very choicest, and that does not carry its credentials on its forehead. With a curious instinctive sympathy with his heroine, he will have it appear that nobody on whom she cares to smile or frown can possibly be commonplace.

The treatment that Mme. de Staël herself receives from her biographer has been indicated already. It is unbounded and unmitigated praise from beginning to end—praise of her face, her heart, her head; of her beauty, her sensibility, her enthusiasm, her intelligence, her knowledge, her conversation; of her principles, of her practice, of her personal charm, and of her literary style. Dr. Stevens excels in picking out apt quotations from earlier biographers and critics; and the passage from the preface in which he collects some of these testimonies is an excellent index to his own views of his heroine's perfections:—

She has been known abroad chiefly as the author of a couple of "fictions," or by French party criticisms and anecdotal disparagements; but critical students of her works and her times know that she was a profound ethical thinker; a political leader whose persistent liberal teachings have again ascendancy in her country; a "Queen of Society"; an oracle of the first minds of her age; the leader, as Lacretelle records, of the spiritualistic reaction against the materialistic philosophy of the Revolution; one of the principal promoters, as Lermier asserts, of the literature and criticism of the Romantic school, in France, as contrasted with its old rigorous Classicism; the first, as Goethe affirms, effectively to break open the way for the outspread of German literature over Western Europe; the most genuine heroine of the Revolution; the most steadfast opponent of the despotism of Bonaparte—"the last of the Romans," as Lamartine says, "under this Caesar, who dared not to destroy her, and could not abase her"; the greatest woman of her times, as Macaulay asserted; the greatest woman in literature, as Byron said; the greatest woman yet produced by Europe, as Galilei believed—a superb intellect, and a woman of loving and most lovable soul.

On this tack Dr. Stevens proceeds throughout. Where he can quote a passage of panegyric, he quotes it; where he cannot, he makes one for the occasion. For a picture of Mme. Necker's youth we are given the well-known rhapsody of De Guibert, in which, according to the worn-out fancy of those days, she is introduced in a travesty of Greek costume as the "priestess of Apollo." "See her! see her!" all exclaim when she appears; and they hold their breath to hear her. "In hearing her one would be disposed to say that many persons, many experiences, were mingled in her one soul," &c. A few years later we have Bonstetten's testimony that "there is more intellect displayed at Coppet in a day than in many whole countries in an entire year." Then comes Frederica Brun, the Dane, with her evidence; "I have never seen anywhere a heart so superabundant in sentiment, a soul of fire, like hers." She travels in the South, and we are told that "genius never looked through clearer eyes on the marvels of Italy than in the person of Mme. de Staël." It is the same with her domestic relations, with her political conduct, with her attitude towards Napoleon, with her effect in England and Germany. Occasionally Dr. Stevens quotes judgments that dwell on Madame's foibles, such as those of Miss Burney and the well-known sayings of Byron; and very rarely he can be got to admit that there is something in them. Byron refers to the death of the young De Staël in a duel, and adds, with more truth than kindness, "Corinne is, of course, what all mothers must be; but will, I venture to prophesy, do what few mothers could—write an essay upon it. She cannot exist without a grievance and somebody to see or read how much grief becomes her." The biographer confesses that "there is some truth in this judgment"; and, indeed, it is borne out by all the facts of the case. Sympathy with her woes, praise for her genius, this is what she was always craving for; and no biography that does not bring out this fact can present a true impression of her. Her conduct in her exile is the standing witness of the one craving, the craving for an audience "to see how much grief becomes her"; and of the other there is evidence in the opinions of all the really great men that she came in contact with, and in a hundred stories not quoted by Dr. Stevens. One of these has always struck us as very characteristic. When Mme. de Staël visited Berlin she met the famous Rahel (afterwards Mme. Varnhagen von Ense), talked with her for two hours, and went away delighted. She was eloquent on Rahel's genius and charm; she

* *Madame de Staël; a Study of her Life and Times: the First Revolution and the First Empire.* By A. Stevens, LL.D. 2 vols. With Portraits. London: John Murray. 1881.

was most ungrudging in her praise. "But," she said to her host, to whom she was giving out her impressions, "you will tell me what she thinks of me?" It was these things that made her a terror to many people, that did her grave social harm, and that, as a natural result, gave her grounds for many a cherished grievance. Dr. Stevens is almost blind to this side of his heroine, and his book is consequently of little value as a critical judgment of her character.

Mme. de Staël had a great effect in her day, and her reputation throughout Europe was immense. In revenge, she has been unduly disparaged by this and the last generation, and it is only right that the attempt should be made to set her in her proper place again. From what we have said, it is plain that Dr. Stevens has not made the attempt in the right way, and that his book, which might have persuaded people to regard her as a good-hearted woman of genius, who, in spite of great weaknesses of character, did real services to the cause of literature, will not persuade them to regard her as a being endowed with superhuman virtues and superhuman powers, and suffering with angelic patience intolerable wrongs. With a real love for the highest ideals, she had a wonderfully quick and active intelligence, an extraordinary gift of speech ("an altogether unprecedented glibness of tongue," Schiller called it), and a power of clear statement that marked her out among all the writers of the time. In spite of her abominable self-consciousness, she was so far sympathetic as to be able to influence both men and women and to surround herself with affection—a gift which has been often known to co-exist with a great deal of vanity. She had no originality of ideas, but she was quick in divining what ideas were fruitful and moving; and it is certain that the praise so often bestowed on her *L'Allemagne*—praise bestowed by Goethe and Richter, and repeated by Sainte-Beuve and by Carlyle—is well deserved. She made Germany known to France, as Coleridge about the same date was making it known to England. Mme. de Staël's power of appreciating German idealism was of quite another order from Coleridge's; but her effect was wider, if less deep, than his, and nothing can rob her of the distinction of having helped to set in motion the Romantic tide which rose to its height a few years after her death. With all her undignified self-tormenting under Napoleon's persecution, she cannot be said to be wholly self-centred. She was as sentimental as if she had been a daughter, not of Necker, but of Rousseau; she loved admiration and sympathy, and flung herself at forty-five into the arms of her youthful second husband, Rocca, as if she had been twenty. But, though the social instincts were unduly strong in her, and though she almost pined herself to death when forbidden to gratify them, her delight in the things of the mind was genuine. It was because she felt herself crippled, disabled, unable to use her great gifts for the furthering of her own or others' intelligence, that she suffered so keenly from her exile. "Her dominant characteristic," says Sainte-Beuve, "the point in which all the contrasts of her nature meet, the swift and penetrating spirit that pervaded and sustained that marvellous assemblage, was certainly the spirit of conversation—of sudden, improvised speech, springing in its divine freshness from the perpetual fountain of her soul; there, in very truth, lay what she calls *life*, that magic word which she so often employed and which must be so often employed in reference to herself by all who speak of her." In the presence of this enthusiasm for life, for intellectual movement, how insignificant, after all, do her weaknesses appear! Her books are a great fact in the history of France and of Europe; and she herself, with all her faults, was a greater fact. Modern literature owes her more than it is prepared to own.

SHADOWS IN THE SUNLIGHT.*

WE presume that *Shadows in the Sunlight* is written by a woman, although, as is often the case, so far as the name on the title-page guides us, the book might be written by man, maid, or matron. But the internal evidence points to feminine authorship; the sorrowful disappointment of a childless mother is depicted with an intelligent sympathy of which few men would be capable; while there are certain trivial mistakes in reference to business matters into which a woman would be likely to fall. The book shows some want of knowledge of the world; and, as we are inclined to add, some want of knowledge of human nature, although that, in a measure, may be matter of opinion. The heroine, upon whom the author has concentrated her attention, is a clever and spirited study, but, to our mind, a phenomenon, and an impossible one. We may grant, though we hesitate to make the admission, that the best and most candid of women may be guilty of a strange piece of deceit under sudden and violent temptation. But we cannot admit that that hasty act of madness would as suddenly and absolutely change a frank and warm-hearted wife into a domestic hypocrite, who has to keep from a confiding husband the secret of a cold-blooded deed of cruelty. Though a first guilty step had precipitated her into an ugly dilemma, we believe she must have been impelled irresistibly, alike by her character and conscience, to the alternative of making atonement by full confession. At the same time we admit that, by straining moral probabilities to suit the purposes of the plot, the author has

conceived an ingenious story, in which the excitement is sustained throughout.

Certainly we should never have foretold Kate Bryanton's course of conduct from what we learn of her on first acquaintance. She is a lively Irish girl, with almost a superabundance of health and an overflow of good spirits, that, altogether regardless of the consequences, hurries her into innocent *étourderies*. She is confident, besides, in the power of her piquant beauty, and feels that it authorizes her to take extraordinary liberties. She is impulsive, frank, and outspoken to a fault; and when we first meet her, driving with an elder sister, she does not hesitate, half laughingly, to own that she has fallen in love at first sight with the new dispensary doctor. For once the course of true love seems to run smooth. For the favourable impression proves to be mutual, and Kitty promptly marries Dr. French, with the full approval of her parents. The couple might have lived happily ever afterwards, and the novel might have ended ere it had well begun. But, unhappily for Kitty, she has innocently, though not unconsciously, made a malignant domestic enemy. Why Rose Dogherty, who has been half a confidential servant, half a humble friend, in the family of the Bryantons, should have detested the second daughter so heartily we hardly know. At all events, there is no doubt of the fact; and the young wife, most unfortunately, has to do with one of the most implacable, treacherous, and vindictive natures that we have met with in an extensive experience of novels. Somewhat weakly, Kitty has consented to have Rose forced upon her by her mother as confidential servant. Forthwith Rose lays herself out to sow dissensions between her new master and mistress. A vicious jealousy inspires her natural turn for intrigue and mischief-making, for she takes it into her head to fall in love with her master. To do him justice, Dr. French has no suspicion of Rose's feelings. But he learns to appreciate the treasure his mother-in-law has spared to their household, and finds Rose a most invaluable woman and the most capable of assistants in the dispensary and surgery. Rose, under the mask of her stealthily unobjectionable manners, abuses the influence she has insensibly gained, and stings the injured wife by perpetually making unassuming displays of it. Yet, as Dr. French really loves his wife as sincerely as ever, no great harm might have been done before they had come to an explanation had it not been for that inexplicable impulse of Kitty's which committed her to a cruel course of deceit, and placed her in Rose Dogherty's power. The original cause of the deed which wrecked her life and happiness was an act of kindly charity. The Frenches had undertaken the charge of an orphan child, brought to them under highly romantic circumstances. The little boy has entwined himself round the hearts of both, and so far they have been richly rewarded. But her husband's fondness for it disturbs Kitty. It seems to show that she might have assured his love could she only have given him a child of her own. The watchful Rose neglects no opportunity of stimulating this morbid feeling, while Kitty begins to think that even this little stranger is a tie between her and her husband, and looks forward with nervous apprehension to the time when it may possibly be reclaimed. The dreaded day comes on her unexpectedly. When out for a solitary walk, she meets the father, and learns in the purpose of his visit that her worst fears are to be realized. Then she is beset by the terrible temptation to which she so strangely succumbs. Accident so far has saved her unexpectedly, in arranging for her intercepting him, before he has had the opportunity of communicating with her husband. A wild idea flashes through her brain, and it is quickly moulded into definite shape. Accident serves her still further. Her embarrassment and distraction strike the visitor. Not unnaturally he never attributes them to the actual cause, but believes that this motherly and warm-hearted young wife is hesitating to break the intelligence of a fresh bereavement to him. She lets him go on deceiving himself, slowly mustering resolution and cunning enough to assist the process when necessary. She becomes not only deceitfully cruel, but positively infamous on the spur of the moment. She leads the sorrowing widower to the grave of his young wife, and there she dashes the last drops in the cup of comfort from his lips, by telling him that his baby has been laid beside its mother. The lie appears to be as stupid as it is heartless. It is most improbable that the father who has come a long journey on such an errand could be sent away without expressing his gratitude to the worthy doctor who had consented to accept the care of the child. But Kitty, who hitherto had been honesty itself, shows herself quite equal to the occasion. She does the best for herself in desperate circumstances where immediate detection is almost inevitable. She launches herself recklessly into the regions of romance and forges the most monstrous accusations against the affectionate husband who had adored her. She tells her companion that her husband is jealous of her; she more than insinuates that Dr. French is a brutal tyrant, of whom she goes in hourly terror of her life. She appeals to Mr. Felton's gratitude and his chivalry to avoid a meeting which might have the most painful consequences for the sorrow-stricken benefactress of his lost child; and he is won to consent by her obvious confusion, at once so very natural and engaging. "Well, I go forth into the world again, a lonely man," is his touching farewell as he turns away from his wife's grave. And Kate French lets him go in that belief, although naturally she feels some relenting. So violent a strain on our credulity is doubly an artistic mistake. Hitherto, as the author intended, our sympathies have gone with Kate. Now, of course, they are effectually diverted; and when Rose

* *Shadows in the Sunlight*. By E. Owens Blackburne, Author of "Illustrious Irishwomen." Cecil Brooks & Co. 1881.

Dogherty misrepresents the meeting in the churchyard, making the calumniated husband jealous in good earnest; when the supposed discovery indirectly kills French, and when he dies addressing delirious reproaches to his wife, although the wretched woman endures excruciating torments, we are ready with the verdict—serve her right.

We lose sight of the widowed Mrs. French, and a period of some five-and-twenty years may be supposed to elapse, when we meet an agreeable widow in easy circumstances, travelling abroad under the name of Mrs. Chetwode. We cannot help suspecting from the first that it is our old Irish acquaintance; the suspicion is rather confirmed by her having a grown-up son in her company; and suspicion changes to absolute certainty when Mrs. Chetwode is brought in contact with an elderly Bessie Morris, who reminds us unmistakably of Rose Dogherty. Nor does the author mean to make any great mystery on the subject; we are intended to know who Mrs. Chetwode is; and as "Bessie" has recognized her former victim, we are sure that the *incognita* cannot be long preserved. Indeed, the old persecution is immediately renewed, and Mrs. Chetwode lives in hourly expectation of the disclosure of her very uncomfortable antecedents. She has as much reason as ever to shrink from disclosures, for having once given herself over to deceit, she seems to have cultivated a decided taste for it. Selfishness also would seem to have grown upon her. No doubt she has done her duty as a mother by this "William Chetwode," who repays her maternal cares with the most affectionate devotion. But all the time, as she knows full well, she has been interposing between him and a noble fortune. "William Chetwode" has no claim on anybody but her, and that claim she is ready to honour to the extent of her means. But "Charles Felton," as the young man really is, is heir to his grandfather's ample estates and a family baronetcy to boot. Things are further complicated by a passionate attachment the young man conceives for Aileen Power, a very fascinating Irish girl; and subsequently by the loss of Mrs. Chetwode's money, which has been "deposited" in the Bonus Bank, which breaks. We may observe that the completeness of the pecuniary catastrophe would have seemed more plausible had the lady been represented as a shareholder in place of a depositor. Had Rose Dogherty never turned up again, it would have been all the worse for "Sir Charles Felton," though better for the next heir to the estates. But Rose, who has only grown more relentless with time, who has private designs of her own, in which she desires Mr. Chetwode's co-operation, turns the screw with remorseless energy. And Mrs. Chetwode, tortured into sheer desperation, anticipates the impending disclosures by a full, though very tardy, confession. It will be seen that the plot of the story is exciting enough; it is lightened by a variety of incidents more or less ingeniously devised, and it begins, as it ends, with a lively love affair, Mrs. Chetwode figuring in the former and her son by adoption in the latter. But we dispute the right of an author to base thrilling sensations on moral phenomena which are incredible or impossible; and in his own interests an author should never abuse the privilege of dealing arbitrarily with conduct and its motives.

FRENCH LITERATURE.

M. ADRIEN DELAHANTIE'S two volumes (1) are capital specimens of a kind of work which might with advantage be much commoner than it is. The author, who belongs to a family which for full two centuries has supplied officials to the Civil Service of France, discovered some time ago, at the death of one of his relations, a mass of papers which, though they had suffered severely from time and neglect, and still more severely from the contributions which the village grocer had been allowed to levy on them, still seemed promising. He had them sorted, and studied them, with this book as a result. A great many family portraits, photographically reproduced, and some miscellaneous illustrations, decorate the volumes, the letterpress of which is very fairly full both of amusement and instruction. As an instance of the former may be mentioned the ideally eighteenth-century conduct of one of the ladies introduced, who never quarrelled with her lover except on one ground—that, seeing her as he did every day, he thought himself entitled sometimes to leave unanswered the voluminous epistles which, notwithstanding their constant intercourse, she regularly addressed to him. "Tender sentiments," she said, "could be expressed so much more suitably by letter than by word of mouth," a craze to which posterity owes some very admirable, and much very worthless, literature. As regards historical instruction, the light which the author throws on the much-abused system of farming the revenue deserves especial mention. *Une famille de finance* is hardly a book to be read generally, except with judicious skipping. But the judicious skipper will find his account in it, and any regular student of the French eighteenth century will find attentive perusal still better repaid.

Louise de la Vallière is perhaps one of those persons about whom everybody thinks that he knows everything. It is, however, often in these very cases that there is least of really accurate know-

ledge. M. Lair's book (2) is of the careful and satisfactory, but not specially brilliant, kind which the teaching of the *École des Chartes* and the altered state of literary standards in France has made common. Such a book written even fifty, much more a hundred, years ago, would have been better probably as a work of art; but it would almost certainly have been inferior as a book of reference. M. Lair's citations of his authorities are incessant; and, indeed, the book may be said to be, more than anything else, a patient and ingenious mosaic of passages from contemporary books and documents more or less obscure. That M. Lair has written thus because it was his plan to do so, and not from any inability to write otherwise, is sufficiently evident. His book is a valuable one. It contains, in an appendix, the letters of the Duchess to the Marquis de Bellefonds, written after her "conversion," and good copies of the two well-known portraits, the one in all the glory of ringlets, necklaces, and gorgeous raiment, the other in Carmelite garb—portraits of which, it must be confessed, the latter is by far the most attractive.

M. Emile Rauné has given (3), in the "Bibliothèque Charpentier," a carefully collated edition of the well-known *souvenirs* of Mme. de Caylus. The creatress of the part of Esther, the "last flower of the age of Louis XIV.," deserved to have her text carefully looked to, and M. Rauné claims (it would seem with justice) that his version is the first accurate and the first really complete one.

The third, and last, volume of Colonel Iung's history of Napoleon Bonaparte's youth (4) completes the work; but also disfigures it. Certain recent events seem to have inspired the author, not merely with the unhappy idea of writing a violent preface of a personal kind, but also with the still unhappier idea of adding to his work (which ostensibly terminates in 1799) a chapter of irrelevant and brutal comment on the death of Napoleon at St. Helena and on the subsequent fortunes of the members of his family. The present Republican party in France has given many proofs of rancour and of bad taste, but few more striking than this. As Colonel Iung's book is a really useful contribution to history, we can only hope that he himself, in a moment of resipiscence, or some one else for him, will lop off these offensive excrescences. It is, however, unfortunately true that the actual historical work of this volume is less well done than that of its predecessors, the Egyptian expedition, for instance, being treated with astonishing incompleteness.

The republication of M. Louis Blanc's *Dix ans de l'histoire d'Angleterre* has been completed by the issue of the tenth volume (5), dealing with the year 1870 until the fall of the Empire. The volume is padded with a long disquisition on the English land question, the tone of which may be easily divined, though it is only just to say that M. Louis Blanc, with his usual freedom from conscious unfairness, admits the drawbacks of the opposite system of peasant proprietorship and compulsory division.

The second volume (6) of M. Gambetta's speeches, edited by the faithful M. Joseph Reinach, extends from February 19, 1871, to July 24, 1872. That M. Gambetta is not one of those orators whose speeches read like finished literature, nor even one of those whose command of their hearers is reproducible in reports, is notorious. The editorial work, however, in the way of summaries of the situation, *entre-faits* of abstract, &c., is exceedingly well done.

All readers of the *Revue des Deux Mondes* who take an interest in Russia must have looked forward to the publication of M. Anatole Leroy-Beaulieu's work on the Czarish Empire (7). The book is not by any means a mere republication of review articles, these latter having (as, no doubt, in strictness they should always do) served merely as rough drafts of the treatment of particular points. The book is to be on a sufficiently great scale, the present bulky and closely printed volume being the first of three and perhaps of four. M. Leroy-Beaulieu, it is needless to say, speaks with a great deal of authority. He has worked at the subject for ten years, no small portion of which he has spent on the spot. His competence is admitted on all sides—from M. Dragomanoff, the chief literary representative of Nihilism, to the pillars of political orthodoxy in Russia. His work therefore deserves a fuller examination than can be given to it in this particular place. We shall only observe that on a first reading it appears a little open to the charge of aridity. It is not relieved with notes, citations, and illustrations, in the style of histories from Gibbon's days downwards, nor has it the vivid literary polish of history à la Voltaire or à la Rulhière.

M. Legouvé, ever busy in his old age about matters which concern the family man, has dealt (8) with the *question des femmes* in a little pamphlet. He is an emancipator *mais non tout*, as the Sybil of Panzoust might have said. He would introduce the

English law of breach of promise of marriage, in cases of seduction, and would protect married women's earnings. He speaks of Mlle. Hubertine Auclerc in a highly complimentary manner. It is to be feared, however, that Mlle. Auclerc will think the veteran Academician a sad backslider when she finds that, acknowledging the logical right of women to vote and sit, he denies their practical right, and refers them to hospitals and *bureaux de bienfaisance* as their proper sphere.

M. Molinari's excellent letters on Ireland in the *Débats* are already familiar to most people who have interested themselves in the Irish question, but their republication in book-form (9) adds an important item to the catalogue of the literature of the subject. It is needless to say that M. Molinari, the most practical, unprejudiced, and well informed of judges, is what Mr. Gladstone would call a Saturn-and-Jupiter man—that is to say, he holds that even Mr. Gladstone cannot make water run uphill. The papers which are added on Canada and Jersey are altogether slighter, but are pleasant enough reading.

There are many alarmists in France, but M. Raoul Frary (10) is certainly the most serious and sensible of them. His spectre, of course, wears a pickelhaube, but he talks about it in the most logical and connected manner; manifests a perfect acquaintance with history, past and present; speaks of other nations, even of the Germans themselves, without the least heat or rancour; and if he be, as optimists in his own country and others will say, a madman, is the most methodical madman we have ever met. His argument is mainly this. France is constantly increasing in riches and not increasing in numbers or strength; her neighbour is constantly increasing in numbers and strength, and withal becoming poorer. Given these premisses, what is the conclusion? More marriages and general habituation to carrying and using arms is the remedy suggested, and M. Frary does not disguise his belief that the wars of the future are likely to be far more disastrous than those of the past, precisely for the reason which makes enthusiastic Liberals believe that all war will soon cease. Wars have been dynastic, says M. Frary; they are now popular. It is difficult in a short space to do justice to an argument which is singularly well marshalled and remarkably accurate in its details. But Frenchmen are not the only persons who may read M. Frary with profit.

M. Emile Montégut occupies a position by himself in French critical literature. Since the death of the great masters of that art—Sainte-Beuve, Gautier, and Mérimée—he shares the primacy with MM. Renan, Scherer, and St.-Victor, falling short, it may be, of each in something, but excelling the first in masculine firmness, the second in catholic sympathy and acuteness of insight, the third in simplicity of style. In this volume (11) the greater part of the work rather deals with art than with literature, and M. Montégut emits some very doubtful opinions, as, for instance, in his preference of *Duré* over *Plaxman*. But there is a short paper on *Boccaccio*, which is a critical gem. The analysis of the character of *Alacié*, and of its bearing on Italian character generally, is a wonderful piece of appreciation. An essay on *Tasso* seems to us distinctly inferior, and some papers on *Dante* are really papers on *Dante's* illustrators.

In *La maison d'un artiste* (12) M. de Goncourt has had the not infelicitous idea of giving a kind of *catalogue raisonné* of the contents of his house, which he justly describes as "a nest, than which there is none in Paris fuller of things of the eighteenth century." Two volumes are occupied by this. We shall not say that there are not certain *longueurs*, but the book is a curious and a not inexcusable one. Without impertinence, however, we may perhaps be permitted to say that it has made us more than once ponder what a clever man the late M. Jules de Goncourt must have been.

Splendeurs et misères de la cour de Rome (13) is not inaptly characterized by its catchpenny title. It is, however, fair to say that there is rather more solidity in it than might be expected. The author seems to have a real acquaintance with his subject, which his desire to minister to the anti-clerical prejudice of the day has not altogether obscured or tampered with.

Of two volumes of travel, or something like it, which we have before us, one is a specimen of the almost worthless mixture of geography and fiction to which Frenchmen are so strangely addicted; the other a well-written and not uninteresting book recording a short tour in the Caucasus. Of course, it is possible that M. Gabriel Ferry's experiences (14) may be fact, and that M. Koechlin-Schwartz's (15) may be fiction, but that is not the impression produced by the books.

Three reprints of considerable importance have to be noticed in the poetical way. *L'art d'être grandpère* (16) has been added to

M. Lemerre's edition of Victor Hugo. M. Becq de Fouquières has given in the "Petite Bibliothèque Charpentier" an edition (17) of Chénier which, without entering into the labyrinthine quarrel between the editor, M. Gabriel de Chénier, and their respective publishers, we may pronounce to be very handy, and for all practical purposes complete. Lastly, and perhaps most important of all, comes the first volume of a charming issue (in the ancient series of M. Lemerre's "Petite Bibliothèque," and therefore possessed of every advantage of print and paper) of the entire theatre of Corneille (18). Hitherto the complete works of the greatest of French dramatists have only been accessible in very cumbersome or in very unattractive editions; and the evil habit of publishing a *choix* has contributed to make the less popular plays, in which some of the very finest inspirations of the famous *lutin* appear, all but unknown. The present volume contains *Mélite*, *Citandre*, and *La veuve*. M. Pauly, the editor, has given a notice and brief but sufficient notes. He has, however, wisely determined not to embark on an endless register of variants, considering the poet's finally settled edition of 1682 as sufficient. MM. Erckmann-Chatrian's suppressed drama *Alsace!* (19) does not altogether authorize the suppression, though the censors may perhaps have interpreted the precedent of Phrynichus wisely. It does, however, authorize the remarks of a critic with whom we are very much surprised to find ourselves temporarily in accord. The tone and outline of the pieces are emphatically flabby, the best version we can devise for M. Zola's epithet of "molle."

The dreadful series of familiar conversations on political subjects with which the unfortunate youth of France are drenched by the "Bibliothèque du jeune Français" is diversified by a most pleasant and instructive *Petite grammaire de la prononciation* (20). The many anomalies of the subject are dealt with admirably by M. Pontis.

The March number of the *Revue des arts décoratifs* (21) deserves notice for a paper on M. Lechevallier-Chevignard, with some excellent illustrations of that very capable master of decorative art.

The same subject, on a far larger scale, is dealt with in the two beautiful volumes which make up MM. Davillier and Guillemard's *Maîtres ornementistes* (22). One of these volumes consists entirely of plates, the number and variety of which must make the work a precious one for reference. It is only to be regretted that the author (Baron Davillier is only responsible for an Introduction) should have introduced a few scattered English names without having explored English libraries or houses, and with evidently the faintest knowledge of the subject, even at second-hand. He might very well have confined himself to the Continent; but, if the Channel was to be crossed at all, it ought to have been crossed seriously.

The ingenious and respectable critic who discovered in the late M. Flaubert's principal novels an organized attempt to deface and caricature successively the idea of man, the idea of woman, and the idea of God, would doubtless have found in *Bouvard et Pécuchet* (23) an extension of this terrible iconoclastic purpose to the entire domain of art and science. The critic, however, has joined the author in the ranks of the majority, and he can scarcely have left an equally sensitive idealist behind. This unfinished work is a curious one. *Bouvard* and *Pécuchet* are typical specimens of the class which Balzac loved to portray, and to which he devoted a *physiologie*, the class of the *employé*. They meet by accident, and swear eternal friendship. Soon afterwards *Bouvard* inherits a fair fortune, and *Pécuchet* reveals unsuspected savings. They club their means, and seek the Frenchman's elysium, a *propriété*. The entire book (only the last few chapters of which were left unwritten) records their Odyssey of disillusion. At first they try agriculture, as is natural, and, as is natural also, lose a considerable portion of their means. Then they box the compass of the arts, the sciences, and the fads. They manufacture preserved foods, which promptly turn bad; they study anatomy, with the result of having a domiciliary visit from the police; they collect curiosities and fossils; they elaborately explore literature. Then they have a religious fit; and religion turns to philanthropy. They adopt the son and daughter of a convict only to find them turn out revolting specimens of coarse vice. The book is disfigured here and there by a certain crudity of incident and expression, which are not found in the author's earlier books, and which may be due either to the lack of final revision or to bad company in the shape of MM. Zola and de Goncourt, as well as by the same undue obtrusion of the author's medical studies, which increased the power, but impaired the attraction, of *Madame Bovary* and *Salammbo*. But it has the old supremacy of expression, the old humorous contempt of the contemptible side of things, and the old familiarity with human nature; and if it is an immoral book, all literary followers of Ecclesiastes will do well to look to their moral state.

On the other hand, paradoxical as it may seem, *Madame de*

Dreux (24) seems to us to have a distinctly immoral tendency. Mme. Henry Gréville seems to be leaning more and more to that side of her master, M. Feuille, which once provoked a critic, and no prude of a critic either, to say, "M. Feuille, une honnête femme n'a pas de ces tentations." *Madame de Dreux* is the usual story of an extremely superior woman with an unworthy husband and a worthy lover, who is kept at arm's length with all the propriety in the world, but who is clearly represented as the right man, while the other is the wrong. Novelists of Mme. Henry Gréville's type seem to take a pleasure in treating marriage as a kind of "peculiar institution," very much resembling slavery; the virtuous woman, like the virtuous slave, does not run away, but it is hinted that only the finest of feelings prevents her from doing so.

M. Claretie's book (25) was described almost simultaneously with its appearance by a Parisian critic as an instance of "le reportage dans le roman." Having just found ourselves in agreement with M. Zola and naturalism, it is perhaps a natural thing that we should rebound to M. Brunetiere and the Neo-classics. At any rate, we certainly agree with the particular utterance. *Monsieur Adam et Madame Eve* (26) is an imitation, not too unsuccessful, of M. Droz. *Renée* (27) is a sensational novel not destitute of power. In *Tombée du nid* (28) Mlle. Fleuriot has given some sketches of Bruton life which deserve a good deal of praise. But a novelist of any other than the first rank should not refer her readers to previous works of her own. *Pascale Nauriah* (29) is a somewhat corrupt following of Balzac, and *Une belle journée* (30) is one of the not unfrequent and not insignificant attempts to follow in the steps of M. Flaubert with the staff of M. Zola. A real master in the particular style would have made a *nouvelle* of fifty pages of the subject which M. Céard has treated in a novel of three hundred and fifty. Some of these three hundred and fifty had much better not have been written at all, and the rest would have gained by reduction on the scale just suggested. M. Anatole France is a person acquainted with literature, and his book (31) is pleasantly penetrated with evidences of the fact. As for *Le père de Martial* (32), M. Albert Delpit may perhaps have been a little carried off his feet by the success of *Le fils de Coralie* and *Le mariage d'Odette*; but his new book fairly sustains his reputation.

ADVERTISEMENTS.

DORÉ'S GREAT WORKS, "CHRIST LEAVING the PRETORIUM," "CHRIST ENTERING JERUSALEM," and "MORÉS BEFORE PHARAOH," each 39 by 29 feet, with "Dream of Rute's Wife," "Christian Martyrs," &c. at the DORÉ GALLERY, 30 New Bond Street. Daily, Ten to Six, 1s.

FRENCH GALLERY, 120 Pall Mall.—THE TWENTY-EIGHTH ANNUAL EXHIBITION OF PICTURES by Artists of the Continental Schools (including Portraits of the Right Hon. W. E. Gladstone, Prince Bismarck, Count Moltke, Dr. Döllinger, and other works by Franz Lenbach), is NOW OPEN. Admission, 1s.

PALL MALL GALLERY, 48 Pall Mall.—NOW OPEN to the Public, the EXHIBITION OF PICTURES by the celebrated Russian Artist, AIVAZOVSKY. Aivazovsky's "COLUMBUS'S SHIP IN A STORM."

AIVAZOVSKY'S "COLUMBUS LANDING on the ISLAND OF SAN SALVADOR," and many other notable Paintings, at the PALL MALL GALLERY, 48 Pall Mall.—Admission, 1s. Fridays, 2s. 6d. Catalogues, 6d.

THE GROSVENOR GALLERY.

SUMMER EXHIBITION.

Now Open daily, Nine to Seven.

Admission, One Shilling. Season Tickets, Five Shillings.

ARTISTS' GENERAL BENEVOLENT INSTITUTION,

For the Relief of Distressed Artists, their Widows and Orphans.
 The ANNIVERSARY DINNER will take place in Willie's Rooms, on Saturday, May 14, at Six o'clock. The Right Hon. the EARL of ROSEBURY in the Chair.
 Donations will be received and thankfully acknowledged by:
 JOHN EVERETT MILLAR, B.A., Honorary Secretary.
 PHILIP CHARLES HARDWICK, Treasurer.
 F. LAMBE PRICE, Secretary, 24 Old Bond Street, W.
 Dinner Tickets, including Wines, One Guinea.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.

For the Science and Practice of Agriculture.
 For Intending Land Owners and Occupiers, Land Agents, Surveyors, Colonists, &c.
 The R.A.C. Farm, surrounding the College, is a mixed farm of about 800 Acres.
 Chairman of Committee of Management.—The Right Hon. the EARL of DUCIE.
 For Prospectus of College and Farm, List of Scholarships, Prizes, Diplomas, &c., apply to the PRINCIPAL.

LANDSCAPE GARDENING.—STUDENTS for the Profession will be received by Mr. EDWARD MILNER in the Crystal Palace Company's School of Gardening and Practical Floriculture after May 1.—For Prospectus, apply to the Under-said at the Palace.

F. K. J. SHENTON,

Superintendent of the School of Art, Science, and Literature.

OWENS COLLEGE, Manchester.—THE COUNCIL, having decided to found a new PROFESSORSHIP of APPLIED MATHEMATICS, invite applications from Gentlemen desirous of becoming Candidates. The fixed stipend is £200 per annum, in addition to two-thirds of the fees paid by Students.
 The appointment will date from September 20 next. Further information respecting the duties of the Professor may be obtained from the PRINCIPAL of the College.
 Applications and testimonials, addressed to the Council, will be received up to May 20.
 J. HOLME NICHOLSON, Registrar.

THE MISSES A. & R. LEECH'S SCHOOL for LITTLE BOYS RE-OPENED on May 4, at 65 Kensington Gardens Square, Hyde Park, W. Arrangements are made for Daily Pupils.

EDUCATION.—GERMANY, BONN-on-the-Rhine, 37 Baum-schuler Allee.—The Fräulein KUNDE receives a limited number of YOUNG LADIES. Home comforts, best masters, unexceptionable references.—For particulars apply to the above.

LORD SALISBURY'S ELECTION.

THE functions of a leader of Opposition in either House of Parliament furnish a curious illustration of the growth of institutions without legal or official sanction. The representative of a great party, though he has neither rank nor salary, is next in importance to a Minister. The Conservative leader of the House of Lords exercises a still more anomalous power, inasmuch as he commands and directs a permanent majority. It is desirable, though not indispensable, that he should be an effective debater; and it is necessary that he should possess the qualities of a statesman. In politics, as in other departments of human activity, it is convenient that deliberate choice should coincide with natural selection. With the possible exception of Lord CAIRNS, Lord SALISBURY has, in the House of Lords and in his own party, no competitor in ability or energy, and few who have equal experience in public affairs. He represents the feelings and instincts of the Conservative aristocracy more fully than the eminent lawyer who for a short time acted as leader in the House of Lords. If his formal nomination had been adjourned, Lord SALISBURY would probably have soon asserted his claim to the position which he will now occupy by general consent. A letter written many years ago by Lord BEACONSFIELD on the mode of designating a Parliamentary leader has been opportunely published. His own ascendancy, which was afterwards officially and universally recognized, was neither caused nor at any time sanctioned by the formal choice of his followers. He truly says that Lord STANLEY, afterwards Lord DERBY, had nothing to do with his appointment. He might have added, that for some time the leader of the party in the House of Lords made strenuous efforts to repress the ambition of an unwelcome colleague. At a Conservative meeting in Liverpool, when Mr. DISRAELI had already proved himself the inevitable successor of Lord GEORGE BENTINCK, Lord DERBY affected to hesitate as to the name which he should associate with the toast of the House of Commons, and ultimately selected Mr. DISRAELI to return thanks as one of several candidates. It was by fighting in the front rank, and eventually in advance, that the leader who was destined to retain the post longer than any predecessor first established his title.

The relation between the respective leaders of the two Houses varies with circumstances from perfect equality to the subordination of a secondary colleague. The direction of the policy of the party in the House of Commons is the more important function, except in the limited number of cases in which the second House reverses the decision of the first. Lord SALISBURY will exercise a paramount influence in the choice which must from time to time be made between acquiescence in distasteful measures and resistance which cannot be often repeated or indefinitely prolonged. The every-day conduct of Parliamentary business will be regulated by Sir STAFFORD NORTHCOTE, not in virtue of any claim of superiority, but because he sits in the more powerful Assembly. The Duke of RICHMOND must have intended to record the general understanding among the Conservative peers when he stated that the appointment of Lord SALISBURY would not constitute him leader of the party. The absolute or relative influence which he may acquire will depend on causes which are independent of any formal selection. Only two or three years ago the facility of conducting an Opposition by two leaders of equal rank was illustrated by the cordial

co-operation of Lord GRANVILLE and Lord HARTINGTON. If they at any time differed in opinion, they were too prudent to admit the outer world to their confidence; and there is every reason to believe that they acted together in perfect harmony. Their comparative rank in the party was so difficult to define that, when the Opposition succeeded to office, Lord BEACONSFIELD, in advising the QUEEN as to his successor, apparently regarded Lord HARTINGTON as the recognized leader; and Lord HARTINGTON suggested a reference to Lord GRANVILLE. As soon as the real and inevitable chief of the party repudiated his own self-denying ordinance, no hesitation was felt in recognizing his paramount claim. There is no reason why Lord SALISBURY and Sir STAFFORD NORTHCOTE should not concert their policy where a distinct understanding is necessary, and in their independent action recognize the same general principles. Forty years ago the conduct of Opposition in the two Houses was managed under much greater difficulties. Lord LYNTHURST, who disliked PEEL, and sometimes formed schemes for supplanting him, on several occasions defeated Government measures in the House of Lords which the head of the party had allowed to pass the House of Commons; yet the Opposition became every day more formidable till the Government of Lord MELBOURNE was overthrown. If Lord SALISBURY and Sir STAFFORD NORTHCOTE at any time differ, it is certain that neither will condescend to intrigue against his colleague.

Lord SALISBURY has sometimes been accused of pugnacity; but it would be more accurate to say that he is disposed to fight in earnest. The principal risk connected with the gift of sarcasm and invective is that formidable weapons sometimes leave too deep a wound. In debate it is often, though not always, prudent to remember, in accordance with the ancient precept, that an enemy may possibly hereafter become a friend. There is no reason to doubt that Lord SALISBURY will appreciate the responsibility of speaking for a great party as well as for himself. Large and accomplished intellects are not prone to mannerism or to running in uniform grooves. A mastery of language supplies the means of expressing strong arguments in a courteous and inoffensive form. Lord SALISBURY's literary cultivation has given him a style, which, both in speech and writing, is at the same time copious and correct. The greatest orator of the present day becomes confused and awkward as soon as he begins to write, though he is an experienced, and indeed a voluminous, author. Lord SALISBURY has no equal among colleagues or opponents in the difficult art of composing State-papers. The Circular which he published on his accession to the Foreign Office was, if credible report may be trusted, produced at a single sitting; and its only defect was that it was too conclusive. The same quality of vigour and clearness may be discerned in Lord SALISBURY's speeches; but it is, perhaps, superfluous to vindicate ability which is not disputed even by adverse critics.

Some of those who profess to have studied Lord SALISBURY's character and opinions have, perhaps through a love of paradox, maintained that he has a vein of Liberalism in his moral and intellectual constitution. The predilection, if it exists, has not been publicly disclosed; but it is probable that a powerful and original mind may not confine itself to the commonplaces and narrow traditions of a party. With average politicians, though they may share his opinions, Lord SALISBURY, perhaps, feels an imperfect

thoughtful men are liable to a kind of indecision and arguments which are used in support of various conclusions. There is little in the circumstances to encourage any democratic tendency, and they may be associated with a general dislike of change. Revolutionary doctrines are every day more openly proclaimed, and they are for the first time finding their way into legislation. Resistance may not eventually succeed, but the task of attempting to preserve the institutions of the country may well excite a noble ambition. The object is assuredly not to be attained by systematic collision with superior force. Tact and patience, and sympathy with anything which may be good in suggested changes, are as indispensable as courage. Sir ROBERT PEEL, when he first became Prime Minister, caused some amusement by the solemn declaration that he was ready to reform proved abuses; but he afterwards exemplified his meaning, with the result of disarming his most restless adversaries. The conditions of Conservative opposition have since become far more unfavourable; but, on the other hand, the modern leaders of the party have some advantages. The great majority of the upper and middle classes are already united with them in opinion, though not always by avowed political connexion. They may also feel confident of the virtual sympathy of a large section of the Liberal community, and of some of its chief representatives. A coalition may not be imminent, nor is it immediately desirable; but no obstacle ought to be unnecessarily placed in the way of eventual union. All the forces of order and justice may perhaps be insufficient; but they should be organized and prepared.

THE MARRIAGE AT VIENNA.

THE marriage of the Crown Prince of AUSTRIA to the Princess STÉPHANIE of Belgium has been celebrated with brilliant success, in fine weather, among an enthusiastic people, and with all the pomp and dignity for which the Austrian Court has long been celebrated. To the achievement of such a success two things are needed. There must be the persons to excite or feel the appropriate sentiments of loyalty, admiration, and delight, and there must be a most distinct and careful arrangement beforehand of everything that is to take place. The Imperial Family is liked throughout Austria and is adored in Vienna. The bride was young and fair and was already an Austrian through her mother. The CROWN PRINCE has not had many opportunities of making himself known, but he has behaved himself as well as a young man of twenty-three can do when he has in any way come before the public. The grandson of the German EMPEROR is his intimate friend, and the PRINCE OF WALES came to do honour to a marriage which unites a relation of his own to the only Court which can rival that of England. Deputations from Hungary, from the other provinces, and even from Bosnia, came to lay their tribute of good wishes at the feet of the heir of the throne. All, or almost all, the great historic families of Austria were represented. As for the populace of Vienna, it was wild with happiness, and took its holiday as no other populace can—endless illuminations, endless cheering, beer, sausages, and vast crowds, without a policeman or a drunkard among them. Then, every possible effort had been made to give high and low enough to do and enough to see, and yet secure that all should pass off without a hitch and without delay. On Saturday the bridegroom and bride attended a State ball in the Hofburg. On Sunday there was a great popular festival. On Monday was brought in state from Schönbrunn to the Theresianum, an educational establishment from which all Imperial brides since the days of MARIA THERESA have started to make their entry into Vienna. On Tuesday the marriage was performed by the Archbishop of PRAGUE. Every detail of every part of this protracted ceremonial had been provided for. It is, indeed, obvious that every detail of great State ceremonials must be thought over and settled, or something would go wrong. But in Austria there is a more than usual minuteness of regulation, or, at any rate, a more than usual explicitness in announcing what was to be done. The programme of the ceremony filled many columns of a newspaper, and the Viennese were informed days in advance precisely how the Royal couple would comport themselves, when they would stand up, when they would bow, and when they would

kneel. If the people took much trouble to please the Court, the Court also took much trouble to please the people. Royalty in these days is one of the most hardworking of callings. What it has to do may not be distasteful, but it is certainly laborious; and among hardworking Royal personages few are so active as the father and the cousin of the bride. The labours of the King of the BELGIANS are, to a certain extent, self-imposed, for he is always going out of his way to promote some scheme for human welfare. But, at any rate, he carries out his abiding idea that even the King of a small State must exert himself if he is to be worthy of a crown. The PRINCE OF WALES has the incontestable merit of always being where he is wanted. No sooner is he back from St. Petersburg than he is off to Vienna. In her new home the bride will find that hard work is a matter not so much of choice as of necessity. An Emperor of Austria, in modern days, has, no doubt, many pleasant relaxations, but he must work hard or his Empire would go to pieces.

The Archduke RUDOLF, Crown Prince of Austria, was born in 1858, so that his short life dates back to the time when the civil commotions of the Empire had been terminated by measures which certainly did not err on the side of leniency, and when the military misfortunes of the Empire had not begun. When he was in his cradle, his father was looking on the frightful slaughter of Solferino; and when he was just out of the nursery, he heard that all was lost at Sadowa. While he has been growing up the whole character of the Empire has been changed. Austria has been pushed out of Italy by France, and out of Germany by Prussia. Her face is set eastwards by the force of circumstances, and by the will of Prince BISMARCK. She is reconciled to Hungary, and is a constitutional country, not in name, but in reality. What chiefly concerns the CROWN PRINCE is that the result of all these changes has been to increase very largely the personal influence of the Emperor of AUSTRIA. To have been beaten in battle after battle, and to have had a Constitution forced on him, and to have had to accept the strange system of a Dual Government at the hands of subjects who openly threatened to league themselves with his enemies, seem curious methods of strengthening the power of an Emperor. But the very circumstances that shook the cohesion of Austria made some centre of cohesion indispensable; and in Austria no other centre of cohesion was left except the EMPEROR himself. The German, the Magyar, the Slav, and the Pole, all see in the EMPEROR something beyond and above the Empire to which they belong. They all feel that they have a friend whom it is possible to reach; and to have inspired this feeling, to have fostered it, and to have made it stronger to-day than it was ten or five years ago, is not only a great triumph to the EMPEROR, but is an indication of qualities which, within their range, are not only admirable, but approach to greatness. And when his son comes to inquire how this most unsuccessful of Emperors has also been in his way most successful, he will find that there is one special point in the EMPEROR's character which has always called forth the warmest recognition on the part of those who have known him best. He is true to the persons with whom he works. The EMPEROR has often had to change his advisers; for he has had very different circumstances to deal with, he has had very different policies to carry out, and, in the course of a troubled life, he has had very much to learn. But while he works with a man he trusts him, listens to him, and encourages him. He does not sulk or suspect; he does not intrigue or countermine; and it is this that has won him the confidence and the respect he now enjoys.

The Princess STÉPHANIE was born in 1864; and, as her grandfather died towards the end of 1865, she can scarcely recollect the great founder of the Belgian monarchy. The only very sad event of her father's reign, the widowhood and madness of her aunt, the unfortunate Empress CHARLOTTE, occurred when the PRINCESS was too young to understand what was happening. Her childhood has been spent in the unruffled peacefulness of quiet Belgium. Her memory can at the utmost only carry her back to the sad days when there was a great war just beyond the Belgian border, and her great-uncles and cousins of the House of ORLEANS once more made themselves heard of in the world. Politics can hardly trouble her young mind little as yet, and it may be hoped that it will be long before they begin to trouble her.

and the partner of the cares of an Emperor. But, at any rate, if she ever has anything to do with politics, if only to watch them with the interest of a wife, she has the advantage of having come from a good school. Her grandfather made not only the Belgian monarchy, but Belgium itself, and her father has continued the task, and, what is specially important, has continued it in the same way. There are many—perhaps most—monarchies of which it may be said that the King is indispensable to the people in the sense that the nation has monarchical institutions and is not fit for any other. But of some monarchies it may be said that they seem to require for their existence not only a sovereign but a sovereign of a special and characteristic type. The German Empire is bound together, so far as it really is bound together, not only by having the Royal Family of Prussia at its head, but because the Royal Family of Prussia has qualities, traditions, and aptitudes which exactly fit it to lead Germany. It is too much to say this at present of the Imperial Family of Austria, for the Emperor is the first Emperor of the new Austria that has been created in his time, and if he seems now to present the type which suits the Austria of to-day, it remains to be seen whether the type can be perpetuated. But of Belgium it may be certainly said that it is what it is, not only because it is a monarchy, but because its monarchy has been of a peculiar type, which has been manifesting itself and acting on the nation for half a century. It is not only that the King, whether father or son, has been moderate, impartial, and sensible, a good constitutionalist, watching over and moderating the continual storms in his teacup of a Constitution, but he has made Belgium and Europe feel that he was more of a man and a king, of larger views and broader sympathies, than the Belgians could reasonably have expected to get. The Royal Family of Belgium has managed to make itself much thought of in Europe, and the bride, if she is proud of her new home, may also feel entitled to be proud of the home from which she came.

THE MONUMENT TO LORD BEACONSFIELD.

THE fear that Mr. GLADSTONE might be prevented by indisposition from proposing the erection of a monument to Lord BEACONSFIELD was fortunately unfounded. By universal consent he discharged the duty which he had imposed on himself with faultless taste and judgment. Equal praise might justly be awarded to Lord GRANVILLE, except that on personal grounds his task was less difficult. In both Houses the movers and seconders carefully abstained from attempting to justify the motion on political grounds. The earnest regard for English honour and greatness which Lord SALISBURY selected for eulogy is, at least in the House of Lords, not regarded as a crime. As Lord SALISBURY eloquently said, the strength of Lord BEACONSFIELD's patriotic feeling was recognized by many of those who had no connexion with the policy which he pursued. Lord GRANVILLE recounted his singular experience in having heard the first speech and the last of his life-long opponent. In both cases he added to a well-known story interesting details. In Lord GRANVILLE's judgment Mr. DISRAELI's maiden speech possessed sufficient merit to have commanded applause if the speaker had then been known to the House of Commons. In the present Session Lord BEACONSFIELD sent a message to Lord GRANVILLE in the middle of the debate on Afghanistan to the effect that he must speak at once. His determination had the effect of disturbing the customary order of debate, and the Ministerial leader complained of an inconvenience which then seemed to have been unnecessarily caused. It was afterwards known that Lord BEACONSFIELD was only enabled to take part in the debate by the use of drugs which for the time soothed a violent pain. It was only of late years that Lord GRANVILLE had been brought into direct relations of political antagonism with Lord BEACONSFIELD. There was never any bitterness of feeling in their contests; and indeed Lord GRANVILLE, with the effect, though wholly without the purpose, of paying a compliment to himself, acknowledged that he had been treated with uniform fairness and courtesy by successive leaders of the Conservative party, and by none more than by Lord BEACONSFIELD. There are some persons, and Lord GRANVILLE is one of them, whom it would be difficult to treat with conscious unfairness or with deliberate discourtesy. Lord GRAN-

VILLE had few political opinions in common with Lord BEACONSFIELD; but they must have had many points of sympathy; and, if in nothing else, they resembled one another in freedom from prejudice and in equability of temper.

In the House of Lords it was unnecessary to prove by argument the propriety of the proposed honour. The cordiality with which the motion was received was neither increased nor diminished by the circumstance that Lord BEACONSFIELD had not been born in the purple. The smoothness with which, in Lord GRANVILLE's words, the portals of that Assembly roll back before distinguished men is so complete that they enter at once on full equality with their hereditary colleagues. It would have been well if the bitterness of party feeling in the House of Commons could have been suspended, so as to allow of the vote being passed with similar unanimity. Mr. GLADSTONE had to meet or anticipate an opposition which was happily feeble; and he also, not unnaturally, took occasion to vindicate his own consistency. He was perfectly right in attaching importance to strict conformity with precedent and usage. As he justly said, laxity in such matters, and additions to established practice made under the influence of feeling, tend to produce future embarrassment. It was sufficient for his purpose to quote the language in which Lord JOHN RUSSELL moved for the erection of a monument to Sir ROBERT PEEL. In that case, as in the present, the Minister of the day had been for many years the rival and the opponent of the deceased statesman; and, although it happened that at the close of his life Sir ROBERT PEEL had given independent support to the Government, he had never joined the party which it represented. Indeed, PEEL's last speech had been delivered in support of the vote of censure on Lord PALMERSTON in the celebrated PACIFIC debate. Before 1846 Sir ROBERT PEEL and Lord JOHN RUSSELL had during nearly forty years seldom voted on the same side in a division. At a much earlier time a monument was erected to CHATHAM by a Parliament in which his political opponents had large majorities. On the American war, which then engrossed universal attention, he agreed with the Opposition in both Houses. The expediency of the monument was, in fact, questioned in the House of Lords, and it was known to be extremely distasteful to the KING; but Parliament and the country almost unanimously recognized his greatness. The protest of FOX and WINDHAM against the honour conferred on the memory of PITT was not deserving of imitation, and it is possible that they opposed the motion with the less reluctance because they knew that it would be carried by an overwhelming majority. FOX, at least, ought to have distrusted his own judgment when he recalled the bitter personal animosity which he had felt to his successful rival.

If concurrence in political opinion were the test of the claim to posthumous honours, they would lose all their value. On the death of a conspicuous statesman the question whether his memory should be recorded would be decided by the mere process of counting heads. If he belonged to the party which at the time was in a minority in the House of Commons, no personal merits and no public services would avail to secure him due recognition. It is also possible that the House of Lords might refuse a monument to a Liberal statesman in resentment for similar intolerance of Conservative merit on the part of the House of Commons. If no such objection were raised, a Minister who happened to die in office would be entitled almost as a matter of course to the distinction of a monument. It may, of course, be contended that the politician who best serves his country is the proposer or supporter of useful measures; but when the merits of different systems of legislation are compared, the issue once more turns on comparison of numbers. The statesman who raises or maintains at a high level the standard of political ability and performance also deserves well of the country. Mr. GLADSTONE declared that Lord BEACONSFIELD "had sustained a great historic part, and done great deeds written on the page of Parliamentary and national history." It is right that effigies in bronze and marble should record the same qualities which excite general interest and admiration. For the second time since the death of Lord BEACONSFIELD, Mr. GLADSTONE reminded the House that the Minister whom he had himself consistently and vehemently opposed had in his foreign policy acted strictly within constitutional limits. Lord BEACONSFIELD then, as Mr.

GLADSTONE now, was supported by a large majority in Parliament; and he had a technical right to do what the House of Commons thought fit to be done. The expediency, and even the morality, of his measures must be judged by other standards; but the nation cannot repudiate or disavow the exploits to which, through its representative, it has once been a party. Mr. GLADSTONE must have strongly disapproved the factious efforts of pamphleteers to represent Lord BEACONSFIELD's constitutional supremacy as a usurpation of the Crown. Perhaps his condemnation of the fallacy is more severe because he wishes to reserve to himself the right of condemning the last Parliament as well as the Government which it supported.

Of the sour partisanship which inspired the minority little need be said. Mr. LABOUCHÈRE, whose language was not offensive, could only expand the erroneous proposition that a Minister cannot be dissociated from his policy. He admitted that two opposite judgments might be formed on Lord BEACONSFIELD's policy; and that the ultimate judgment must rest with posterity. Even posterity may not necessarily be agreed, for there are still strong differences of opinion as to the policy of PITT and FOX, and even as to HAMPDEN and CROMWELL. It is nearly certain that posterity will not erect statues in honour of Ministers who may be imperfectly remembered. It would have been a cause for regret if there had been any serious difference of opinion on the present proposal. The rejection or grudging acceptance of the motion would have rendered the commemoration of great men hereafter difficult or impossible. As long as Parliamentary government exists in England there will be hostile parties, and neither will be disposed to allow the other a monopoly of monumental honours. Few Englishmen admire the practice which prevails in some foreign countries of obliterating on each successive change in the form of government the monuments and inscriptions which commemorate the former predominance of another political system. The same spirit instigates the factious jealousy which regards as criminal the assertion of unpalatable political opinions. Mr. GLADSTONE, more wisely and more generously, wishes to preserve the landmarks of national history. At some future time controversy on his own claim to the gratitude of his countrymen may perhaps be rendered unnecessary by his clear exposition of the principle which determines the award of national honours.

MR. BRADLAUGH.

THOSE doubtless sincere friends of the Conservative party who, while professing themselves strong Liberals, reiterate their desire for a strong and well-led Opposition, must have been very much gratified by the proceedings in the matter of Mr. BRADLAUGH on Tuesday. This year, as last year, the Government, having got themselves into a difficulty by their half-hearted advocacy of Mr. BRADLAUGH's claims, apparently determined to get themselves out of it by a policy of masterly inaction. Forced out of that, they took refuge in the attempt to smuggle their *protégé* into the House by a measure the discussion of which was to be strictly limited to morning sittings. This intention again was frustrated by the determined opposition of the House of Commons, an opposition which seemed not unlikely to turn Mr. GLADSTONE's favourite description of himself and his friends as the minority from a playful piece of irony into an actual fact. There was but one weapon left by which the Government might hope to avoid the consummation from which they seem to shrink, the necessity of having to make Mr. BRADLAUGH's admission a definite and avowed part of their legislative programme, as much favoured in the way of allotment of Government time and Government advocacy as any other part. Mr. BRADLAUGH might bully the House as he bullied it last year, Mr. GLADSTONE might in the same way refuse assistance, the odium of incarceration might once more be thrown on Sir STAFFORD NORTHCOTE, and so the House might be induced to efface and stultify itself, as it effaced and stultified itself last year. If this ingenious device failed, it was not owing to any want of concert or punctuality on the part of the two chief parties to the proceeding. Mr. BRADLAUGH duly delivered his assault, Mr. GLADSTONE duly ignored the SPEAKER's appeal for assistance. But, instead of suggesting the Clock Tower, Sir STAFFORD NORTHCOTE simply suggested a proceeding which was so obvious and necessary a conse-

quence of previous votes that Mr. GLADSTONE could offer no objection to it, and even the malcontents below the gangway saw that resistance was useless. The exclusion of Mr. BRADLAUGH from the precincts of the House during ill behaviour cannot be pretended to be even a stretch of the House's authority. It is as direct and legitimate an exertion of its prerogative as his inclusion in the Clock Tower or in Newgate would be. Instead of including him in either of these two places, the House included him in space—all space, that is to say, outside its own precincts. The person whom Mr. GLADSTONE and the electors of Northampton delight to honour became, in consequence of the resolution, perhaps as pertinent an example of the phrase "a prisoner at large" as has ever been created or imagined.

Mr. BRADLAUGH's letter of protest does not perhaps display the ability with which his friends are wont to credit him, and which his enemies have hitherto been content to allow. The amateur practice of the legal profession seems to have produced a curious twist in Mr. BRADLAUGH's mind—a twist to which, indeed, some reference was made in a recent judgment. He objects to being hindered from performing his duties and exercising his rights, not, apparently, remembering that misconduct of all sorts and kinds is constantly inflicting on many of his fellow-citizens, from the order larcenous to the order murderous, temporary or permanent inability to perform duties and exercise rights quite as indubitable as his. The convict under sentence of death cannot vote for Mr. BRADLAUGH; the father of a family at hard labour cannot perform his undoubted duties to his children. Mr. BRADLAUGH therefore should have directed his protest, not to the effects of his sentence, but to its justice. He has so far shown ingenuity that he has not, like some of his injudicious partisans, used the word "illegal." It is not such a proof of ingenuity that he has in the very words of his protest against his exclusion practically admitted its legality. "The privileges of the House itself," he says, "render it impossible for me to submit the question to a court of law"—that is to say, the House, in its conduct to Mr. BRADLAUGH, has simply been exercising its undoubted privilege, and no exercise of an undoubted privilege can be illegal. The distinction in such cases between "illegal" and some vaguer words dear to orators is usually impressed upon students of constitutional history and law at an early age. A considerable number of persons appear to have been robbed of their education in this particular respect, and among them is Sir WILFRID LAWSON. Sir WILFRID, not taking heed to his friend's judicious choice of language, immediately after that language had been read to the House, gave notice of his intention to move last night that the Resolution was "illegal"—an intention which the SPEAKER's expression of opinion on Thursday may have made him regret.

The House has stultified itself once before in the matter of Mr. BRADLAUGH. It may be worth while to point out, however, that such faint excuses as existed last year do not exist now. Then the House believed, or made as though it believed, that the courts of law might possibly get it out of its difficulty. The alternative between daily hustling on the floor between Mr. BRADLAUGH and the Serjeant-at-Arms and the retention of the elect of Northampton in the Clock Tower as a kind of unholy marabout or dervish, a centre of Radical pilgrimages and a focus of Radical agitation, may have been terrifying to weak nerves. The refusal of the Government to do anything whatever in the matter may have bewildered others. From the moment of the acceptance of Sir STAFFORD NORTHCOTE's motion on Tuesday the major part of these dangers vanished; while, on the other hand, the Government had already signified their intention to bring in a BRADLAUGH Relief Bill, and the only question between them and the House was whether they should bring it in at the back or at the front door. Mr. GLADSTONE's announced intentions of making some new arrangement in consequence of the opposition to morning sittings was not speedily carried out, possibly because the PRIME MINISTER was waiting to see the effect of the final rush which Mr. BRADLAUGH manned against the House on Tuesday. It would be a singular disrespect to the assembly and a singular confession of feebleness if Mr. GLADSTONE accepted Sir WILFRID LAWSON's well-meant attempt to help him and Mr. BRADLAUGH. The unauthorized publication of the LORD CHANCELLOR's letter to a country clergyman must have added not a little to the difficulties of the Govern-

ment. Their highest law officer sees, he tells us, no possibility of refusing to extend the option to affirm to all scrupulous infidels. It is thus a case of conscience with Lord SELBORNE, and, as he informs us that he has never had the slightest difference with his colleagues on this point, it is evidently a case of conscience with them too. No explanation of the apparent reluctance of the Cabinet to relieve their consciences in this particular point, in a less roundabout manner than they have hitherto striven to do, suggests itself very readily. Perhaps it may be that the calls—Irish, African, Indian, and so forth—on their consciences are so many and urgent that a roster has had to be established. Such a settlement as Sir WILFRID LAWSON offered would, however, obviously not satisfy even the toughest conscience in the Cabinet. Mr. BRADLAUGH is, indeed, magnanimously indifferent to the means by which he obtains his rights and is enabled to perform his duties. He will swear anything and everything just as anybody pleases. That has apparently been the attitude of the Government also. Let him add a vote to their tale, that is the real question. But Lord SELBORNE's letter throws an entirely new light upon the matter. Not Mr. BRADLAUGH personally, but the possible scrupulous atheist of the future, is the object of their care. They have certainly dissembled that object hitherto with a good deal of skill and success; but it now stands fully revealed. Such proposals as Sir WILFRID LAWSON's, independently of their intrinsic inconvenience, are curious methods of dispensing the even-handed and exalted justice which Lord SELBORNE praises in a manner worthy of his high office, though on an occasion nearly as curious as these methods themselves. Every action, committed or omitted, of the Government up to the present time has had not merely an appearance, but a direct purport, happily described by a phrase slightly altered from one with which Mr. THOROLD ROGERS, in his instructive way, gratified the House in reference to another matter on Wednesday, "The HOBNE 'TOOKE Act was a scandal being dictated by antipathy to a 'single individual.'" The proposed BRADLAUGH Act, and still more the motions and resolutions which at different times Mr. GLADSTONE, Mr. LABOUCHÈRE, Sir WILFRID LAWSON, and other friends of Mr. BRADLAUGH's have proposed or supported, are, we presume, in the same way scandals being dictated by sympathy with a single individual. It is not surprising that the House up to yesterday should have pretty constantly declined to connive at this scandal. Any change of conduct on its part cannot be too much deprecated or regretted.

SOUTH AFRICA.

A CHANGE of Ministry in a colony of the second rank is not an interesting occurrence; and in ordinary times the substitution of Mr. MOLTENO for Mr. SPRIGG as Colonial Secretary at the Cape would scarcely receive even passing notice. On the present occasion, it is possible that the success of the Opposition in the Cape Parliament may have some bearing on the more important affairs of the Transvaal. The victory which Mr. SPRIGG obtained in the division on the vote of censure seems to have been accidental; or perhaps the majority was pledged to approval of the Basuto war. The late Ministerial reverse was not caused by caprice, or by a change in the issue submitted to the Assembly, but by the secession of the ATTORNEY-GENERAL from the Government. During his three years' tenure of office Mr. SPRIGG has shown commendable energy and considerable ability. He first owed his appointment to Sir BARTLE FRERE, who, with accurate discernment of the state of Colonial opinion at the time, dismissed Mr. MOLTENO and appealed to the constituencies. Confusion of mind caused by inveterate prejudice can alone account for the allegation that Sir BARTLE FRERE's intervention was unconstitutional. The constituencies exercised their undoubted right in confirming the decision of the High Commissioner. Then and afterwards Sir BARTLE FRERE possessed a popularity and influence which is rarely attained by a governor of an English colony, and a majority was consequently returned to support his policy and the Administration of his choice. Afterwards, Mr. SPRIGG had to depend on his own resources, and he has met with tolerable success. From time to time he thought it necessary to profess that jealous provincial patriotism which gratifies the self-esteem of colonists. He declined

to receive suggestions from the Imperial Government as to the manner of dealing with the natives, and he undertook the disarmament which produced the war in defiance of the advice and the warnings of the Colonial Office. He was probably supported by local feeling in his refusal to ask or accept military assistance from England; but the Dutch part of the population seems to have disapproved the war, and their antagonism may perhaps have become more decided since the outbreak in the Transvaal. The constitution of the new Ministry seems to indicate the share which divisions of race and language have had in the change of Government. The predominance of the English element is only desirable so far as it furnishes a security for the continuance of friendly relations with the Imperial Government. The new Government represents chiefly the Dutch element as it prevails in the Western province. Sir HERCULES ROBINSON, who is now necessarily absent from his post, would, even if he had been on the spot, have exercised no effectual control over the selection of his future advisers. He has had long experience in colonial administration and diplomacy, and he will probably contrive to avoid collisions with the Ministry.

As President of the Transvaal Commission he has a much more difficult task. It is not known whether the Boers in general share the wish for peace which is professed, and perhaps felt, by their ostensible leaders. There is no reason to expect that they will agree to the surrender of any part of the territory which they claim, whether or not it has been reduced to possession. Any promise of protection to loyal English subjects will be merely verbal, and may probably have no effect when the English troops are finally withdrawn from the neighbouring provinces. The natives will practically be left to the mercy of the Boers, unless they are strong enough to defend themselves. It is more than doubtful whether it will be prudent to establish a protectorate over the natives, even if the representatives of the Transvaal assent to such an arrangement. Outrages will certainly occur on one side or on both, with the result of involving the English Government either in a quarrel which it will not have provoked, or in another tame surrender of rights and duties. The Boers would hold the protecting or suzerain Power responsible for every native inroad; and, on the other hand, the natives would appeal to the Government which they still trust for defence against the encroachments of the Transvaal settlers. Some English politicians, including at least one member of the present Government, maintained long before the rebellion that the Imperial Government could not justly or honourably abdicate the function which it had once for all assumed of securing the natives against oppression; but the object could only be attained by maintenance of English rule. Remonstrances addressed by an English Resident to the Government of the Boer Republic would be treated with contempt, unless they were backed by a force of which he will not dispose. The withdrawal of a claim to protect some hundreds of thousands of people, who were lately English subjects, will be only one among many humiliations which have illustrated that quality of Mr. GLADSTONE's Government which their admirers describe as magnificent courage. Radical writers and speakers sneer at the demand for protection or compensation which is preferred by English settlers and traders who relied in vain on Sir GARNET WOLSELEY's authorized declaration that English sovereignty would never be withdrawn. The sufferers are insolently denounced as speculators or selfish adventurers who must take the consequences of their own rashness. It is in the prosecution of precisely similar enterprises that the English race has spread itself over a large part of the surface of the globe; but Lord PALMERSTON's *civis Britannicus*, who, indeed, was at the time indignantly denounced by Mr. GLADSTONE, has lost his franchise, or rather it has become valueless. The rights of coloured races, though perhaps more doubtful, are not so easily sacrificed without infringement of democratic cant or tradition.

The threats of a native war against the Boers on the withdrawal of the English authorities may, perhaps, be exaggerated by the reporters; and such a conflict, if it really impends, is not to be regarded with complacency. Whatever may be the temporary vicissitudes of fortune, the civilized belligerent will ultimately prevail, and the disasters which might diversify success will probably be ascribed to English instigation. It is not improbable

that in the unsettled parts of the country, English adventurers may, in case of war, take the opportunity of avenging the flagrant wrongs of their countrymen; and the presence of a few white leaders among native bands would be represented as a proof of the complicity of the English Government. The opportunity of profiting, to the benefit of all parties concerned, by the hostility between the Boers and the Caffre tribes was sacrificed at the time of the premature annexation. It was as mediators, or, in case of need, as defenders of the white population against barbarism that the English ought to have intervened. No objection could have been taken to a stipulation that future conflicts should be prevented by the establishment of English sovereignty in the country. One more opportunity was offered of attaining a beneficent result; and it is satisfactory to find that Mr. GRANT DUFF, in circuitous official language, confirms the statement which had been made both by correspondents on the spot and in official despatches. On assuming command of the army Sir EVELYN WOOD, in a telegram to Lord KIMBERLEY, assured the Government that the best and wisest course was to defeat the Boer army, and that he had no doubt of his ability to accomplish the object. It would then be in the power of the Imperial Government to impose its own terms on a population which would, as the General believed, at once discontinue armed resistance. No limit need have been imposed to the liberality of the terms which might have been offered, except that the rights of loyal subjects, white or coloured, must have been effectually protected. Lord KIMBERLEY, in obedience perhaps to superior orders, but under a responsibility which he would only have escaped by resignation, replied, without noticing Sir EVELYN WOOD's advice, by a peremptory order to continue the negotiations. A few days afterwards Sir EVELYN WOOD reported that the Boers were not inclined to surrender any territory; and he referred to his former recommendation. Once more Lord KIMBERLEY abstained from giving any answer; and the General had no choice but to submit to the terms which were practically dictated by the victorious belligerent. After such experience of the temper and spirit of the English Government, it is highly improbable that the Boers will acquiesce in any unpalatable decision of the Commission. If the Government has been well advised in its recent policy, all previous statesmen have been mistaken, not only in their estimate of national honour, but in their calculations of expediency, and in their judgment of human nature.

VACCINATION.

THE excellent letter from Dr. CARPENTER which appeared in the *Times* of Thursday deserves to be printed separately, and to be circulated as widely as possible by all who care about the protection of the community from small-pox. It is especially desirable that this should be done if Dr. CARPENTER is right in saying that the public are evidently "much unsettled as to the protective influence of vaccination." We were not aware that the mischievous propaganda of the Anti-Vaccinationists had been successful to this extent, and, in spite of Dr. CARPENTER's assertion, we are still inclined to believe that the greater prominence given to the controversy of late years makes the alleged unsettlement look larger than it is. Still the action of the Government last year may have done more harm than we think. A question of this kind is one on which the authorities should never even seem to waver; and the preposterous proposal to make exemption from vaccination virtually obtainable at the cost of a licence did undoubtedly make it appear that the Government had entered upon the path of repentance. It is to be hoped that Mr. DOBSON will do what he can to atone for the abortive, but not for that reason innocent, Bill by giving unmistakable and stringent instructions to the local authorities to enforce the law. Where there is a real determination to hinder vaccination, these instructions will of course produce but a very small effect; but there are a great number of well-disposed authorities whose languid good intentions might be stimulated with great benefit to the public. After all, the instrument which will in the long run do most to make vaccination universal is the irresistible evidence of statistics. People are told that vaccination is a protection against small-pox,

and if they saw the statement invariably borne out by facts, they would in time accept it. What shakes the popular belief is the fact that districts in which vaccination is supposed to have been universally enforced are not invariably free from small-pox. The explanation of this inconsistency is that the local authorities have meant much and done little. They have succeeded in making people think that vaccination is universally practised within their jurisdiction; whereas all that with truth can be said is that vaccination is universally ordered. Consequently, vaccination itself comes in for the discredit which really ought to fall upon those who profess to enforce it and do not.

Assuming that Dr. CARPENTER is right in thinking that the public do not feel their old confidence in the benefits of vaccination, the change may be traced, he thinks, to three causes. In the first place, the present generation has forgotten what small-pox was before the introduction of vaccination. Medical records show that, down to the beginning of the present century, small-pox was quite as universal as measles is now. It was a wonder for any one to have reached middle age without having had it. In point of fact, the general use of inoculation cannot be accounted for on any other supposition. People would never have deliberately exposed themselves to a possibly fatal disease if they had not been convinced that the chance of their escaping it, if they were not inoculated, was very small indeed. Half the deaths of children under ten years of age were due to small-pox, and of the total mortality of the country, eight deaths in every hundred were set down to it. For a long time after vaccination had been introduced this state of things was vividly remembered. To meet people pitted by small-pox was still a common occurrence, and the records of every family showed how great its ravages had been. Now all this is forgotten except when an occasional epidemic produced by this very forgetfulness faintly reproduces the loathsome past. In the second place, the benefits of vaccination were overrated in the first instance, and as this exaggeration came to be corrected by experience, there was a natural tendency to treat the use of it as less essential than had at first been supposed. "In process of time the advocates of vaccination were startled by the indisputable fact of the not rare occurrence of small-pox in its worst form among persons who had undoubtedly been cow-pocked." It was found, however, on inquiry, that in an immense proportion of these cases the sufferers were adults, and this suggested the now universally accepted correction that the effect of vaccination is only temporary. Small-pox itself recurs occasionally, especially when the first attack has been in infancy, and all observation points to the conclusion that, in the case of cow-pox, the protective action of the disease is sooner exhausted, and the liability to it most likely to be reproduced during the period of growth. Consequently, a person vaccinated in infancy will ordinarily have exhausted the protection thus secured by the time that he is grown up. Re-vaccination effected then will certainly renew the immunity for some years, and probably for the whole remainder of life—the exhaustion of the protective influence being so very much more gradual when the process of tissue change has ceased to be active. These facts, says Dr. CARPENTER, carry conviction that, "if it were possible to enforce not only vaccination in infancy, but re-vaccination at the age of say eighteen, small-pox might be as completely exterminated as it has been from Malta. . . . That small-pox still lingers among ourselves is plainly owing (1) to the persistence of an unvaccinated residuum; and (2) to the existence among the unvaccinated of a certain proportion who have acquired a renewed liability which re-vaccination would destroy." In the third place, the opponents of vaccination have taken the facts that vaccination in infancy does not afford permanent protection against small-pox, and that even re-vaccination does not afford a protection absolutely without qualification, as tantamount to proof that vaccination is no protection at all. They point triumphantly to a child who has been vaccinated, and has had small-pox; or to the far rarer, and, consequently, more talked of, instances in which an adult has been re-vaccinated and has had small-pox, as if they were conclusive against the practice. The ignorance of many of those to whom they address themselves does not allow them to give proper weight to the really overwhelming evidence that vaccination is very nearly a complete safeguard during

childhood, and that re-vaccination is an almost complete protection for the rest of life.

There is, however, one argument which is more calculated to prejudice people against vaccination as commonly practised than Dr. CARPENTER is willing to allow. This is "the admitted, though extremely rare, transmission with the vaccine lymph of some communicable poison which due care would prevent." Dr. CARPENTER thinks this objection is disposed of by the inquiry whether it would be a sufficient reason to refrain from eating a herb which had been ascertained to give protection against small-pox, "that once in fifty thousand cases injury had accrued from some poisonous plant having been gathered with it which due care on the part of the gatherer would have eliminated"? To the great majority of reasonable persons undoubtedly this would not be a sufficient reason. But it is conceivable that a small minority even of reasonable persons might say that, considering the exceedingly poisonous nature of the diseases which can in rare cases be communicated with the vaccine lymph, they would rather let their children run the risk of taking small-pox. This is not a conclusion which can be defended on any proper estimate of probabilities. But, then, the very contention of the objector is that the danger in the two cases is different in kind, and the greater risk of taking small-pox is preferable to the lesser risk of taking a worse disease. This is not a belief which admits of being argued down. When everything has been adduced on the other side, the man who holds it can still say, Well, I feel it, and while I continue to feel it, I must act upon it. It is a very different case from that of the ordinary objector to vaccination, because in this case there is scientific ground for the dislike. These poisons are capable of being communicated with the vaccine lymph, and when thus communicated, they may be as mischievous in their action as though they had been communicated in some other way. If no other answer were to be had than that suggested by Dr. CARPENTER, the use which the opponents of vaccination might make of this fact would be exceedingly mischievous. Fortunately, however, a complete answer to it exists. The poisons in question can only be communicated with the vaccine lymph when that lymph has been taken from the human subject. If, as in Belgium, it is taken direct from the calf, no such risk can possibly arise. Moreover, the protection afforded by vaccination from the calf is, of the two, the more effectual; so that the superiority of the Belgian over the English system is in all respects complete. Hitherto the Local Government Board have shown themselves strangely inactive as regards the introduction of vaccination from the calf. They were warned some years ago, by no less an authority than Sir THOMAS WATSON, that vaccination with human lymph was exposed to this serious objection, and that the substitution of animal lymph would completely remove it; but, notwithstanding this, the substitution of animal lymph is still in its infancy; and Mr. PETER TAYLOR and his allies are still left free to make what use they like of Sir THOMAS WATSON'S admissions.

THE MEANING OF THE FRENCH EXPEDITION.

THE news of the signature of a treaty between the BEY of Tunis and the French, involving the appointment of a French Resident, is scarcely surprising. The details of the treaty will require consideration later; its general tenour has been sufficiently anticipated. The military pressure put on the BEY was in the absence of any valid help too strong to be resisted. By a well-concerted movement the converging divisions of the French were directed on the central stronghold of the Kroumirs only to find it abandoned. The warriors of the tribes had persuaded themselves that resistance was impossible, and melted away. They are not subdued, but nothing is left for them but to maintain, until they are disheartened or exterminated, a warfare hopeless to themselves, but harassing and costly to their enemies, such as starving and desperate mountaineers can carry on in a difficult country. The first object of the French expedition has been thus attained. But the second object had still to be assured, and what this object is had been fully disclosed in the very remarkable circular of M. ST.-HILAIRE and in the tamer, but equally frank, declaration of M. JULES FERRY to the Senate and the Chamber. What the Ministers

said, was adopted with singular unanimity and absence of comment by the French Parliament, and it must, therefore, be recognized that what France says they said. What will at once strike every reader of M. ST.-HILAIRE'S circular is that the Kroumirs faded out of this circular almost as completely and suddenly as they faded off the hill of the Marabout. It is indeed stated that for years the Kroumirs and their fellow-plunderers have been giving trouble to the French Arabs, who, under the civilizing influence of France, have become too gentle and tame to resist their old enemies. One or two ships also have been wrecked and plundered off the coast, and France has borne this state of things too patiently and too long. "We have," as M. ST.-HILAIRE says, "exercised patience to a degree that has sometimes surprised the world." The world, like the individual, is, no doubt, often unconscious of its own emotions. There has again been no definite frontier line drawn between France and Tunis, and that is "a gap that has to be filled." But there can be no doubt that the BEY, had he been asked, would have been very glad to have a frontier line traced, and, in spite of all the ill-doings of the Kroumirs, there was until lately a cordial understanding between the BEY and the French. When the French had to complain of raids, they asked for compensation from the BEY, and got it. They were duly paid for the surprising patience they exercised. What exhausted their patience was finding, not that the Kroumirs made one more raid, but that the BEY was not like his old self. He was getting anti-French. He had allowed himself to be egged on by foreigners to thwart the schemes of French adventurers and favour the schemes of the adventurers of other nations. The instances given by M. ST.-HILAIRE of this hostility on the part of the BEY are neither numerous nor convincing. He only points to one case in which the permission to construct a railway was given to persons other than Frenchmen; to a scheme that broke down for a competing telegraphic cable; to impediments alleged to have been placed in the way of the construction of a French line; and, lastly, to the famous Enfida case, which is described by M. ST.-HILAIRE in the following astonishing language:—"The case of the Enfida domain, which it was sought to snatch, by illegal means, from the honest and laborious 'Marseilles Company.'" What really happened was that an English subject took possession of the domain under a title which he was prepared to maintain before the proper local tribunals, and the honest and laborious Company declined to appear before these tribunals to show their better right. So far as is yet known, the hostility of the BEY seems to consist in not doing whatever a Frenchman wishes whenever a dispute arises between a Frenchman and a foreigner of a different nation.

A large, and a comparatively successful, portion of M. ST.-HILAIRE'S circular is devoted to the demolition of the claims of the Porte to a supreme authority over Tunis. It is incontestable that this authority was, until the time of the present BEY, completely in abeyance. In the present century the Porte has disclaimed all responsibility for the acts of the Barbary States, and the European Powers have constantly negotiated with the BEY of Tunis as an independent sovereign. What is new in the reign of the present BEY is that, whereas his predecessors were as anxious to assert their independence as France could be to assert it for them, the present BEY has voluntarily addressed the SULTAN, and asked him to accept him as his vassal. This was first done in 1864, when the opposition of France at Constantinople sufficed to reduce the answer of the Porte to a mere formal acknowledgment of the application of the BEY. But in 1871, when it was thought France was no longer to be feared, the BEY applied for, and the SULTAN issued, a Firman, by which the BEY was declared to be a mere Vali, or governor of a Turkish province. France protested, but the other Powers took note of what had been done without pronouncing an opinion on it. They had no objection to Tunis making itself a vassal of the Porte, but they in no way guaranteed its new authority to the Porte. Lord SALISBURY discussed the affairs of Tunis with M. WADDINGTON solely on the ground of English interests and without reference to the claims of Turkey, and Lord GRANVILLE considered no other duty as incumbent on the English Government than that of ensuring the safety and protect-

ing the interests of British subjects. There is not a single European Power which at the present moment thinks itself concerned in maintaining the supremacy of the Porte in Tunis. And there can be no doubt that, unless it is bound by some kind of European law to accept the supremacy of the Porte, France has the most cogent reasons to impel her to see, even by the use of extreme means, that this supremacy shall not be established. Nothing could be more prejudicial to France than that an independent Mahomedan sovereign, having territory contiguous to that of France, should suddenly so place himself as to be able to refer every complaint made by France against him, and every application made to him by France or Frenchmen, to Constantinople. There, where every favour and every recognition of right has to be paid for, interminable intrigues engender interminable delays, and France would be perpetually asked what it would concede in a Montenegrin or a Greek question if it got what it wanted in some trumpety question about a railway or a telegraph in Tunis.

For the purposes of criticism of the circular, the Bey may be accepted as an independent prince, and it then becomes interesting to know what this independent prince is to be made to do for France. French troops are now stationed just outside his capital, a French general has sent him an ultimatum and has visited him in his palace to dictate a treaty, and he has been able by this time to realize what his independence is worth. The nature of the ultimatum presented to him might have been guessed from M. ST.-HILAIRE'S circular. France is not going to annex an inch of Tunisian territory; it does not wish to depose the Bey, or in any way to hurt him. All it asks is to improve him and his country. In describing what France has done and is ready to do for Tunis, M. ST.-HILAIRE soars into the true language of a prospectus. He, as it were, gives himself a concession, and then as concessionaire puts the splendours of this acquisition before an admiring public. France has already done wonders for Tunis; it has created a postal and a telegraph service; it has made one railway and is making two more; it has restored an aqueduct and is going to make a port; it has invested vast sums of money in Tunisian bonds. This is the kind of preliminary expenditure with which prospectuses have made us so familiar and for which confiding readers are ready to take founders' shares. It is, as usual, nothing in comparison with the magnificent objects which are to be carried out if the shares offered to the public are taken up. France is ready, we learn, to engage in a "host of beneficial enterprises," lighthouses, internal roads, vast irrigation, the working of abundant mines of every kind of metal, improved cultivation of land, and the "employment of the hot springs which 'the Romans discovered and used.'" There never was anything so grand in the prospectus way before. Merely by the way, and as a makeweight, France undertakes to manage the revenues, and keep the accounts of the Bey in a proper French manner, to raise the taxes as they ought to be raised, and to introduce a first-class judicial system. Sometimes it is stated in prospectuses that the title to the concession will be completed after the shares have been taken up. This is exactly what M. ST.-HILAIRE proposes to do. He has issued his prospectus, and France has taken it up, and he is now going to complete his title. The process is very simple. A loaded pistol has been held at the Bey's head until he has ratified the concession. And if this seems rather a strong proceeding, France has the amplest moral justification. She is the apostle of civilization, and has the inherent right of a civilized nation to force civilization on uncivilized peoples. She has exactly the same title to civilize Tunis now as she had formerly to civilize Algeria, and as England has to civilize India. The process of civilization apparently in all cases includes, if not formal annexation, at any rate something indistinguishable from annexation. This is the case which M. ST.-HILAIRE puts before France and the world; and it must be owned that in one way he shows himself entitled to speak as the prophet of modern civilization, and that he has pushed its cynicism to a point which has rarely been equalled and can scarcely ever be surpassed.

LIMITATION OF ACTIONS FOR DEBT.

LORD RANDOLPH CHURCHILL had no difficulty in proving the advantages of ready money as opposed to long credit. That the man who pays as he goes is wiser, better, and happier than the man who pays at the end of the year has long been a commonplace with economists. Lord RANDOLPH CHURCHILL did not even consider the case of the man who has not the means of paying as he goes. No amount of conviction that you will have the money six months hence will justify you in the eyes of this stern moralist if you weakly make the purchase at once. We are not at all disposed to question the general soundness of Lord RANDOLPH CHURCHILL'S view. Even among the working classes, by whom the convenience of being able to go in debt for necessities at a time when they are out of work is most strongly felt, credit and saving tend to be mutually destructive. If a man earns no wages for three months and yet keeps out of the workhouse, it can only be by having put money away in the past or by finding shopkeepers who will trust to his power and readiness to pay his debts in the future. Supposing that shopkeepers could not be found to display this confidence alike in his good intentions and in his ability to give effect to them, working-men would be forced to save much more than they do. This would be no real hardship to them, because the fact that shopkeepers continue to trust them shows that they pay in the long run, and they can only do this by saving after they have had the goods, instead of before. If they could be brought to save first and buy the goods afterwards, both tradesman and customer would in the end be better off. There would be no bad debts, and no compulsory dealing at particular shops at which they happen to have an account. This last consideration has done more than anything else to interfere with the spread of Co-operative Stores among the poor. The goods sold at a Store may be better and cheaper, but against this superiority is to be set the fact that the Stores will not give credit, and that the shops will only give credit in bad times to customers who have dealt with them in good times. This reflection may have something to do with the indifference, if not hostility, which the shopkeepers have shown towards Lord RANDOLPH CHURCHILL'S Bill. If it is true that the multiplication of Co-operative Stores has been promoted by the high prices which the practice of giving credit compels retail dealers to charge, it is also true that the convenience of getting credit with retail dealers has greatly checked the multiplication of Co-operative Stores. Whether the change in the law which Lord RANDOLPH CHURCHILL proposed would have much effect in abolishing credit among the working classes is open to doubt. He would allow tradesmen and customers to contract themselves out of the Bill, and the result of this permission might easily be that things would remain just as they are. A formula would be devised which would exempt the shopkeeper from the limitation of time provided in the Act, and every bill scored against a workman would have this formula conspicuously printed at the top.

When we pass from the working classes to those other sufferers to whom Lord RANDOLPH CHURCHILL was anxious to extend protection, the case for interference is even weaker. As regards the poor, it might be expedient to alter the law if it were certain that the alteration would be effectual, and if we could be sure that, if effectual, it would be really beneficial. But as regards minors, married women, men who owe 14,000*l.* to their fruiterer, and people who forget to keep their receipts, the case is different. It is hard to see how Lord RANDOLPH CHURCHILL can have supposed his Bill would make the first three cases any easier, inasmuch as he only proposed to make it apply to debts under 100*l.* Minors who run up enormous bills without the knowledge of their parents and guardians, wives who keep their husbands in the dark as to their dealings with their milliners, and men with an abnormal appetite for fruit are not likely to limit their bills to the comparatively trifling sum of 100*l.* It would become, under Lord RANDOLPH CHURCHILL'S Bill, the direct interest both of debtor and creditor to run them up above this amount. A tradesman who supplies a minor with those miscellaneous articles which a British jury insists on regarding as necessary when once they have been bought and delivered, or a dressmaker who finds that her bill is never asked for, and that the longer she postpones sending it in the more freely orders for new dresses are given, is for the

most part perfectly aware of the real state of the case. The jeweller who adorns the fingers of an undergraduate with the largest-sized rings, or stamps an image of himself upon his customer's shirt-front in the shape of a set of expensive studs, does not in the least believe that these purchases are made to gratify the eye of a doting father. Each and all of these tradesmen know very well that the transaction is in the nature of a speculative investment, and that though they may lose the bare value of the goods, they are sure, if they are paid for them, to gain a great deal more than their value. If it were made impossible to recover debts of more than twelve months' standing, when they did not exceed 100l., the object of every one of these worthies would be to have no customers who wanted long credit on his books except for sums above 100l. A purchaser who showed any desire to keep his bill below that figure would at once be looked on with suspicion. It would be supposed that he or she nourished a mean desire to play the tradesman false in the thirteenth month. Purchasers such as Lord RANDOLPH CHURCHILL has in view would be as well aware of this as the tradesman. They would know that readiness to go beyond 100l. was an elementary proof of respectable intentions, a pledge that if the shopkeeper dealt handsomely by them they would deal handsomely by the shopkeeper. Thus the result of the change might be to increase that extravagance which Lord RANDOLPH CHURCHILL is so properly anxious to check. In all these instances it is not the sanctions of the law which the tradesman looks to. Indeed, these have now become so feeble that they have pretty well lost any terrors they may have once possessed. His expectations of eventual payment are based partly on the sense of honesty which, after all, is pretty widely diffused, and partly on the dislike which a large proportion of mankind still feel to being declared defaulters even when the creditor is a shopkeeper. Upon these foundations the credit system would still flourish, even if one year were substituted for six as the period beyond which debts should cease to be recoverable. Even supposing that the effect of the Bill promised to be greater than seems at all likely, there is not much inducement for the Legislature to move in the matter. It is not convenient for the law to do all that it might do, and the victims whom Lord RANDOLPH CHURCHILL commends to our notice are not particularly interesting. When neither creditor nor debtor can make good any claim on our sympathies, it seems better to leave them to settle their own disputes. When the similar Bill which has passed the Lords comes on for discussion it will not be this or that class only that will benefit by it. The Bill will be one of larger scope, and will ask for support on more general grounds. Lord RANDOLPH CHURCHILL's Bill, except in so far as it proposed to confer a doubtful benefit on the working classes, was exclusively a measure for the relief of interesting extravagance. As such, it may safely be left alone.

A Correspondent of the *Standard* has told a tale of misery which, at all events, goes to show that the long credits which shock Lord RANDOLPH CHURCHILL are very much on the wane. He has been away from London for three years, and now that he has returned he finds himself little better off than an outlaw. The tradesmen that once know him, know him no more. He has to furnish a house, and he cannot get a carpet or a dining-table delivered except on payment at the door. He has to see that his wife is properly shod, and when he naturally objects to paying for boots before they have been tried on, he is met by the difficulty that the messenger refuses to leave them to be tried on unless they are first paid for. Unless this gentleman is exceptionally unlucky, the salutary process of paying ready money seems already to have made abundant progress. The truth probably is that in this respect the rivalry of the Co-operative Stores has done shopkeepers a real service. They do not see it themselves—blessings so very well disguised are seldom recognized until after their work is done; but the fact is beyond dispute. After all, ready money is the feature which really marks off a Co-operative Store from an ordinary shop. The collection of many trades under one roof, and the abolition of free delivery, are much less important elements in the success of the Stores. The former can be, and is being, rivalled by private tradesmen; the latter is not a very great gain in point of cheapness, while it is a decided loss in point of convenience. But the rigid enforcement of ready money does

undoubtedly enable joint-stock shopkeepers—for the Co-operative Stores are now nothing more than this—to undersell tradesmen who give even short credit; and the experience of the *Standard's* Correspondent seems to show that this lesson has at last been learned. Now that the process has begun, there is no obvious reason why it should not go on quite fast enough without Lord RANDOLPH CHURCHILL's aid. All that individual shopkeepers have got to do is to give a discount for cash payments which will bring their charges within a measurable distance of the prices asked at the Stores. Of course, if they ask sums which vary from thirty to fifty per cent. more than the sums for which the same goods can be bought at a Store, and then make a favour to the ready-money customer of taking off five per cent., they must not expect to beat their rivals. But, now that cash payments have gained the footing they have, there is every reason to expect that even the British tradesman will not remain for ever blind to the obvious teachings of self-interest.

FRENCH CONSERVATISM.

THE schism in the ranks of the French Royalists grows more pronounced every day. The Legitimist section of the party has taken a more decided line in view of the elections than it has ventured to do for some years past. The recent aggressions of the State upon the Church had seemed to politicians of the stamp of M. DE FALLoux to suggest a common ground of resistance for French Conservatives of all schools. This coalition was to be altogether different from those which it was sought to bring about under Marshal MACMAHON. The individuals composing it would, to a great extent, be the same; but they would be united by firmer ties. Formerly, though the members of the coalition agreed for the time to divest themselves of their peculiar ideas and desires, with a view to attaining an object which they all had at heart, it was impossible for them to keep their engagement. The cause of this inability lay in the nature of the object they were aiming at. Men who ally themselves together for the overthrow of a particular form of government cannot help asking themselves what is to be done when the overthrow has been accomplished, and it has become a practical question what form of government is to be set up in place of that which has been destroyed. As soon as this question was raised, distrust of one another found its way into the coalition. Its members were pledged to pull down the Republic, and they knew perfectly well that, as soon as it was pulled down, they would be engaged in a furious dispute, whether it should be succeeded by the BOURBON or by the Bonapartist monarchy. The cause which weakened the coalition, viewed from within, made it hateful to those who viewed it from without. The Conservative party were justly regarded by the majority of the nation as bent upon the destruction of institutions with which the nation as a whole was very well content. The result was that the Conservatives were weakened by mutual suspicions when working for an object which, if they had worked for it as one man, would still have been impossible of attainment.

To some at least of the party much meditation on these things has brought wisdom with it. They have recognized the hold which the Republic has taken upon the interests and the imaginations of the French people, and the hopelessness of gaining popular support for a movement avowedly intended to overthrow it. They are now anxious to put the form of government altogether aside, and to make the whole question turn upon the manner in which the government has been carried on. There is nothing, they say, about a Republic as such to prevent Catholics from living peaceably beneath its shadow. Everything depends upon the spirit in which the Republic deals with questions in which Catholics are interested. How the present Government deals with these questions is shown by the dispersion of the religious orders, the suppression of army chaplains, and the secularization of hospitals and schools. The course which policy and principle alike prescribe to French Conservatives is to make the most of the advantage which their adversaries have given them. In the approaching canvass nothing should be said about forms of government. Republican institutions should be formally accepted, and the whole force of the

Conservative attack be directed against the uses to which these institutions have been turned. The policy of the Government is distasteful to many sound Republicans, and if the Conservatives are careful to dissociate themselves from the Monarchical ideas which have hitherto been with too much reason imputed to them, they may hope, under cover of the ballot-box, to attract these Republicans to their side. There was a time when this method would have been rendered impracticable by the attitude of the ecclesiastical authorities. PIUS IX. had latterly become as good a Legitimist as HENRY V. himself, and the French bishops, with scarcely an exception, had taken their cue from the Pope. Now all this is changed. So far as France is concerned, LEO XIII. is not a Republican, but a Republican who has remained under strong temptations to recant. He has never ceased to distinguish between the form of government now established in France and the particular actions of the politicians who for the time administer it. Consequently, in appealing to French Catholics not to mix up these two ideas, men like M. DE FALLOUX can claim the highest ecclesiastical support. They only ask the laity to follow where the Sovereign Pontiff has already led the way.

If this change of tone on the part of the Conservatives had been fairly general, it is possible that it might have had considerable influence. For the first time Republican would have ceased to be a party name, and a general election have turned upon measures rather than upon institutions. It is probable that the number of Republicans who dislike the course upon which the Government have lately entered, and suspect them of intending to pursue it to still greater lengths, is considerable. Hitherto, however, they have had no means of giving effect to their views except by keeping away from the polls. If they voted at all, they must do so either for a Republican who approved of all that the Republic had done, or for a Monarchist who wished to mend matters by sweeping away the Republic. It is never safe to assume that a French Conservative will take an active part in politics, but there was, at least, a chance that he might do so upon seeing the opportunity for the first time offered him. Now the prospect of anything of the kind being brought about is altogether at an end. The Legitimist feeling proves to be as active and as obstinate as ever, and those who are animated by it make no secret of their determination to subordinate every other consideration to the pleasure of gratifying it. No sooner had the appeal of the moderate Conservatives been put forward than there appeared in the *Union* an express mandate from the Count of CHAMBORD directing the Royalists to support no candidate who would not undertake to make the restoration of the Monarchy his first object. From that day forward the wrath of the Legitimist organs has been mainly directed against those Catholics and Conservatives who are anxious, if they can, to live at peace with the Republic. Not M. GAMBETTA himself is more an object of detestation with them than M. DE FALLOUX. Their columns are filled with demonstrations that in France a good Catholic must always, and under all circumstances, be a good Royalist, and that the salvation of the Church and of society depends upon the restoration of HENRY V. The question is one which has been absolutely and definitively decided by the Royal word. The duty of a good subject is to bow his head and obey.

Once more, therefore, the prospects of Conservatism in France seem hopelessly obscured. It is of the very essence of this particular phase of political doctrine that it should accept accomplished facts, and try to make the best of them. The Orleanists have no more cause than the Legitimists to love the Republic, and it is equally their interest that the French nation should recognize the Monarchy as the form of government best suited to the needs of the country. The difference between them and the Legitimists is simply that the Orleanists are willing to give the needs of the country precedence over the restoration of the Monarchy, whereas the Legitimists hold that, if those needs cannot be satisfied by a change in the form of government, they had better not be satisfied at all. The result of this open avowal of incompatible aims must be to reduce the Conservative party to impotence. If the two sections into which the Royalist section has split up had remained united, there might have been some chance that they would have drawn the third section towards them by the mere force of attraction. No such chance exists now. When separated from

the larger body of the Legitimists, the moderate and reasonable Royalists will be too small a party to tempt any body either to join them or to invite their co-operation. Besides, however unjust the suspicion may be, it will certainly be thought that the quarrel between the two sections of the Royalists has reference to methods not to ends, and that the distinction which marks off the Legitimists from the Moderates is simply that the Legitimists have the courage to be sincere. As regards the Legitimists themselves, their present attitude affords additional evidence to a fact which scarcely needed to be thus supported. The Extreme Right are to the full as irreconcilable and as impracticable as the Extreme Left. The interests of the country or of religion go for nothing with them by the side of the interests of their particular theory. If the Extreme Left subordinate the welfare of France to the triumph of the Republican idea, the Extreme Right are equally ready to subordinate the welfare of France to the triumph of the Monarchical idea. The Extreme Left would upset the best possible Government if it were not Republican. The Extreme Right will do nothing to make a Government tolerable unless they can at the same time make it Monarchical. The result of Legitimist persistence must be to prepare a disastrous defeat for all the causes they profess to care for. Every time that the elections are made to turn upon the form of the Government it becomes plainer that France is not in the least shaken in her determination to live under a Republic. Until the Legitimists can bring themselves to see this fact, they must be shut out themselves, and help to shut out all other Conservatives from any useful action in politics.

PREMIERS IN WESTMINSTER ABBEY.

PARLIAMENT, in both Houses, decreed on Monday last that Lord Beaconsfield should have a monument, and that the monument should be placed in Westminster Abbey. Premiers as Premiers have no place or precedence assigned to them in life. It is conceivable, and does, in fact, happen, that a Minister should have no recognized rank in society beyond that of a privy councillor, and should be the inferior, in a sense, of peers whom he had himself recommended for creation or promotion. But death brings many things into their proper perspective, and it cannot be said that we have neglected to commemorate politicians. Nearly a half of the monuments erected to them in the Abbey are merely complimentary, and do not mark the actual place of burial. There are, therefore, many precedents for the intended memorial, though its form is subject for future arrangement. Should we of this generation omit the customary tribute, later ages would certainly supply it, as we have done in the case of Addison, who was a Secretary of State before Premiers were, in fact, invented. He is buried among statesmen, in the vault of General Monk in the south aisle of Henry VII.'s Chapel; but his statue is among the poets, and a slab in the north aisle of the Chapel, "near his loved Montagu," further commemorates him. Montagu himself and Savile, a yet more famous possessor of the title of Halifax, have tablets in the same aisle, near the great monument of Queen Elizabeth. In the same vault with Addison is buried the body of another Minister, his contemporary, James Oraggs, who died of small-pox in 1721. The monument is separated from his grave by the whole length of the Abbey. The old Abbot's Chapel, at the extremity of the south aisle of the nave, is now used as a kind of vestry, under the dignified title of the Consistory Court; and here, between busts of the late Mr. Maurice and of Canon Kingsley, and almost facing the bust of Mr. Keble, is the full-length figure of Oraggs, "in an antique habit, leaning gracefully on an urn." Beneath are Pope's well-known lines, beginning with the equivocal compliment, "Statesman, yet friend to truth."

The first Prime Minister actually buried and commemorated in the Abbey is Chatham. Neither Harley nor Walpole, to whom the title of Premier was first applied in an invidious sense, are commemorated, though Horace Walpole placed a statue in the south aisle of Henry VII.'s Chapel to the memory of his mother, the first wife of the Minister, paying, as he grudgingly notes, forty pounds for the site to the Dean and Chapter. Walpole's rival, Stanhope, has his statue, though he is buried at Chevening, and his monument at the entrance of the choir, over against that of Sir Isaac Newton, may be taken as the earliest precedent for the intended Beaconsfield memorial. Compton and Carteret, who may be accounted Premiers at one time or another after the fall of Walpole and before the rise of Chatham, are not commemorated, but Pulteney, Earl of Bath, and his family are buried in the Chapel. Pulteney was never Premier in the modern sense of the word. Pelham's secretary, Roberts, has a tablet near the tomb assigned by tradition to Chaucer; but neither Pelham himself, nor his brother and successor, the Duke of Newcastle, has a monument in the church. Bute is unmentioned in the Abbey records; Rockingham and North and Liverpool are equally without notice. But to Chatham was assigned the honour of a contest between Westminster and London for the possession of his body.

The citizens would have buried him in their great cathedral, and, as Horace Walpole observes, would have "robbed Peter to pay Paul." They urged that he had contributed so much by his vigour and counsel to the protection of commerce that they ought to be allowed to offer him this mark of gratitude and veneration. It must be admitted, in the face of subsequent events, that, not only would there have been a certain appropriateness in thus making the tomb of the great commoner in the City, but also that it would there have occupied a more distinguished position than it does among a crowd of similar memorials in the Abbey. The number of lesser politicians whose monuments surround his does something to obscure his greatness. But Parliament ruled it otherwise; his dust must mingle, it was said, with the dust of kings; and the north transept has ever since been made a "statesman's corner."

The monument of Chatham, incongruous as it is in a Gothic building, would have looked better in St. Paul's. It is in many respects to be reckoned the masterpiece of Bacon. The figures of Britannia, supported by the Ocean and the Earth, and of Prudence and Fortitude, which support the central statue, are fine in their way; but Bacon, in making the portrait of Chatham true to life, and using Parliamentary robes instead of classical armour or "an antique habit," set an example to his successors in the art of monumental sculpture. Strange to say, the artist himself wrote the inscription which appears upon the base. Its brevity is not undignified, and when George III. warned the sculptor "Now, Bacon, mind you do not turn author; stick to your chisel," he paid him a well-merited compliment. He received 6,000*l.* for the monument, and had to pay out of that modest sum both the cost of the marble and work, and also the Chapter fees, which amounted to not less than 700*l.* There is another memorial of Chatham in the Abbey. It is seldom seen by visitors, though, in many respects, it is of great interest. This is the waxen effigy, in his robes as a peer, and holding a parchment-roll in his hand, which was made after the funeral, and exhibited for many years. It represents him as a short man, but is full of energy, and by no means to be despised as a work of art. The name of the artist does not appear to have survived.

The monument of Chatham's great son is in a situation even more conspicuous than that of the father, but in every other way falls short. The artist was the elder Westmacott. The statue is nine feet high, and the proportions being those of a very tall man, it appears even higher. To support it, an arch had to be turned over the western door, and the gigantic figure with its outstretched arm seems to dominate the whole nave. As in the case of the monument of Chatham, the expenses were paid by a vote of the House of Commons. Fox's monument, which is close by, was erected by his private friends. It has often been remarked that, as the monuments of these great political rivals are close together, so also are their graves; and it is to the proximity of Fox's resting-place to the vault of the Pitt family that Scott's well-known lines allude. *Marmion*, in the introduction to which they occur, was in fact published several years before either monument was completed. The vault constructed for the burial of Chatham contains the bodies also of his wife, his daughter, his son's wife, and both his sons. So that, even if William Pitt had been as insignificant as his elder brother, the second earl, he would yet have been honoured by burial in the Abbey.

The grave of Lord Londonderry, better known as Lord Castlereagh, is between those of Pitt and Fox. Sheridan is commemorated by a gravestone placed in the north aisle by a private friend, Dr. Moore. Canning and Palmerston lie within a few feet of Pitt and Fox; and the statue of Peel, who is buried at Drayton, is close by. At the back of the screen is a bust of Lord Aberdeen on an incongruous bronze pedestal. He was buried at Great Stanmore; and in the same side aisle are busts also of Sir George Cornewall Lewis, Richard Cobden, and Warren Hastings. This fashion of placing busts in the Abbey is increasing, though nothing, not even a classical monument, has a worse effect amid Gothic surroundings. It does not speak well for the invention of modern sculptors that they have been able to devise nothing more suitable. The bust of Keble looks out from a pointed frame of the most strictly Gothic type, but itself is of a Greek model and nude, as are several neighbouring busts of divines. This form of monument has the advantage of occupying very little space; and, under the present régime, space is becoming very scarce in the church, either for burials or for gravestones. Gibson's statue of Peel was the last in which a classical costume was adopted, and the return to the old style in the case of these clergymen and of the miserable little busts of Lord Russell and Lord Lansdowne, both of whom are buried elsewhere, cannot be commended.

Among the Premiers who have no monument in the Abbey the most conspicuous by his absence is Lord Melbourne. At the time of his death the idea that even minor celebrities must be buried, or at least commemorated, in the Abbey had not attained its modern importance. The grave of Dickens in his beloved Rochester would have been the goal of a thousand pilgrimages. Romsey Abbey would not have been unworthy of Palmerston, whose grave is hardly worth noticing in Westminster Abbey. The Melbourne monument in St. Paul's is more remarkable than any monument can now ever hope to be in the Abbey. Baron Marochetti excelled himself in the design and its execution. It would be well for his fame if he had never made anything less expressive than the two angels at the door. The door leads no

whither, but on its panels are inscribed the names of the Premier and his brother. One other Premier is buried in St. Paul's. The Wellington monument bears no allusion to the more peaceful services of the great Duke, who rests near his most eminent political rival, as Pitt rests by Fox. Among other Premiers not commemorated in Westminster Abbey are Shelburne and the late Lord Derby, though Perceval, who is buried at Charlton, has a magnificent cenotaph, voted by Parliament. No inscription has been placed upon it, but a long relief representing the assassination partially makes amends. A sculptor with the literary powers of Bacon might have supplied the omission, of which a parallel may be found in the monument of one of the very first statesmen buried in the Abbey. At the eastern end of the "Chapel of the Lady Margaret," otherwise known as the south aisle of Henry VII.'s Chapel, is a large and handsome memorial in marble, including a portrait in relief. Dean Stanley, with commendable care, has labelled it as the tomb of General Monk; but though there is an inscription stating that it was erected by the executors of Christopher Monk, the second Duke of Albemarle, there is nothing else to indicate its significance. There cannot be any doubt as to the correctness of the ascription, for a long list of noble persons, the second Duke's executors, have placed their names on the base. As so often recorded, the wax effigy of the great general of the Restoration in his armour, and especially his coronetted cap, were among the regular sights until a few years ago, though there is no mention on the monument of the Duke himself.

SATURA POLITICA.

THE present week has been a decidedly eventful one in the way of political occurrences. The French invasion of Tunis has drawn from faithful Radical lips a wailing admission that not even the abominable Government of Lord Beaconsfield ever perpetrated an act that can be compared, for sheer immorality, to this. The news from the Transvaal makes it more possible than ever that one of the astounding political comedies of the century may be performed, and that native valour, backed up by a few English free-lances or defrauded proprietors, may revenge the honour of England on the formidable forces which have cowed the master of the English Army List. In Ireland they outrage merrily, and Archbishop Orok aspires to the bygone glories of the Lion of Tuam and Judah. The northern parts of this island are disturbed by dark imaginings of a plot for the introduction of the Irish Land Bill into the Highlands. Mr. Gladstone has made his speech about Lord Beaconsfield's monument, and has made it very well save for a curious omission. Mr. Gladstone told us—what indeed most people knew before—that Lord Beaconsfield did not personally hate Mr. Gladstone, but by some unlucky chance he did not tell us, what everybody would have been glad to know, that Mr. Gladstone did not personally hate Lord Beaconsfield. The omission is remarkable, perhaps also unfortunate. Knaresborough has supplied an occasion for discreet silence to those who maintain that the country still wholly loves the Government. For Mr. Bradlaugh, an important member of the body politic, this is the week which in a manner either makes him or foredoes him quite, and he may be said to have been considerably foredone already by his exclusion on Tuesday from the anticipated glories of the Clock Tower. The Greeks came and brought presents to the Church of England on Wednesday, but the *fatale machina* was on this occasion not manufactured with anything like the skill of the original *Epeus*. Lord Randolph Churchill has secured the approval of Mr. Broadhurst, and Mr. Jesse Collings has voted in the same lobby with most of the colleagues of the Late Man, as, if the modern Radical retained the picturesque traditions of his putative ancestors, the member for Ipswich would probably describe Lord Beaconsfield. Sir Stafford Northcote has won unwilling testimonies from his opponents on a point of generalship, and Sir William Harcourt has delivered his candid sentiments with regard to the priesthood of the Church of England and also of other communions. Sir William Harcourt is so much in the habit of delivering candid sentiments on subjects about which his knowledge is on a par with his knowledge when he addresses troublesome county magistrates at Stroud and elsewhere, that this last incident may not appear especially noteworthy. The rest must be acknowledged to be all considerable incidents in their way, and some of them at least to be likely to prove the forerunners of other considerable incidents.

The events of the week, however, may be said to be the election of Lord Salisbury to the post of leader of the Conservative party in the House of Lords and the speech in which Mr. Forster demonstrated the excellences of the Irish Land Bill to a somewhat turbulent audience at Bradford. The election, or selection, or whatever it is to be called, of Lord Salisbury was at least, from the point of view of "the tools to the workman," something of a foregone conclusion. The rather impertinent comments on the various merits and demerits of the supposed competitors which filled certain journals for days before the question was really an actual one, and even for days before it was decent to moot it at all, principally showed, as such comments generally do show, the ignorance of the writers and their desire to appear not ignorant. To all persons, however, whether Whig, Tory, Liberal, Conservative, or Radical, who retained their faculty of comparatively impartial laughter, the attitude of what may be called generally the Liberal press towards the late Foreign Secretary must have

been provocative of much amusement. These candid advisers were particularly anxious that the Conservative party should not make a fatal mistake, and choose the wrong man. The wrong man, as it appeared to the obdurate outsider, was the man who was likely to hit the candid friend's friends hardest. It was, taking it altogether, as if the second in a pugilistic duel, discussing the conduct of the fight, should say:—"I hope you will not be so ill-advised as to hit my principal with your closed fist; for your own sake, I trust that you will tie one hand behind you; and I am sure that the commonest considerations of prudence will prevent you from employing the fatal manoeuvre of getting him into Chancery." In some cases the more refined device was employed of hoping that the Opposition would commit this fatal mistake; but this net also seems to have been spread before the bird in vain. That the meeting at Lord Abergavenny's does not, of itself, designate a leader of the party, but only a leader of the House of Lords, all reasonable persons, whether Liberal, Conservative, or neutral, are, we suppose, aware. That, under ordinary circumstances, it is the prelude to some very uncomfortable times for the Liberal peers is sufficiently evident. "Appelez-vous Voltaire; je vous promets des sensations," said M. Veillot, in the days when he was the terror of the unorthodox. There is certainly no Liberal peer in the House of Lords to whom Lord Salisbury cannot promise sensations in the oratorical sense with a serene consciousness of being able to discharge the promise. The only shadow of discomfort for amateurs of real oratorical battle lies in the extraordinarily unequal nature of the fight. Lord Granville has, indeed, an invaluable characteristic which, in the days of the P. R., might have led to his being nicknamed "the featherbed." But though the passive military qualities of that article of furniture are excellent, its active qualities leave something to desire. For active measures the Ministry are left in the Upper House pretty much to a "broken man," the Duke of Argyll, who seems still disposed, notwithstanding his yearning after Saturn and Jupiter and the other realms where two and two still make four, to lend them gracious help now and then. But the Duke of Argyll is not to be named in the same category of orators with Lord Salisbury. He is not even the equal of Lord Cairns, and as a debater he is at best the equal of Lord Cranbrook, while he has come off second-best in more than one conflict with Lord Lytton and Lord Carnarvon. An impartial critic might, perhaps, find it in his heart to wish that, for the better furtherance of that lively political fighting in which impartial critics and amateurs of sport delight, Lord Salisbury might find it convenient to address himself to the task of popular speechmaking. It may be depended upon that, in the long run, the quality which catches the average audience, whether on the platform or in print, is hard hitting. It is by this that the popular idols of the Government party have obtained their reputation, and in this Lord Salisbury, when at his best, has hardly a superior. He has had comparatively little opportunity of displaying this gift since he was Lord Robert Cecil; he may perhaps see his way to a resumption of the display now. In some respects, no doubt, the position of leader, even of a single House of Parliament, imposes restrictions; in the matter of general schemes of policy, it imposes very considerable restrictions. But there is a great difference between rashness of constructive plan and forwardness in hitting the weak places of the adversary. It is the latter task which now falls on Lord Salisbury, and it would be hard to mention any one who is, or for many a long year has been, better qualified to perform it.

Turning to the other side, it is with performance, not with promise, that we have to deal. No Cabinet Minister has yet spoken to his constituents on the Irish Land Bill, and Mr. Forster's utterances at Bradford were therefore not a little interesting. We said that no Cabinet Minister had yet spoken on the Land Bill to his constituents; it might have been safer to say that no Cabinet Minister has yet spoken on the Land Bill at all, notwithstanding the verbal falsity of the statement. The hungry sheep look up and are not fed, or are told to consume the unsatisfactory pasture of the Irish Attorney-General. The *Times*, with the curious ingenuousness which has come to be its chief political virtue, and which after a long interval makes it once more worth reading, remarks that the Bill is by Liberals "taken on trust." Mr. Gladstone understands it, and that is all which a member of the non-stupid party has a right to demand. What Mr. Gladstone does is well. If anybody supposed that Mr. Forster was going to draw up the curtain at Bradford, he made a great mistake. The only interpretation which suggests itself of the reticence of the Ministry is that Mr. Gladstone was the only man who ever understood the Bill, and that he has forgotten what it meant, just as the other day, until Sir R. Cross gently mentioned to him the name of the Duke of Argyll, he was indignant at the idea of this best of Bills having caused dissension in the Cabinet. It is human to forget, and after all, before the third reading, Mr. Gladstone may perhaps remember what the Land Bill does mean, and may at a specially summoned Cabinet Council communicate the meaning to his colleagues with leave to divulge. Clause Seven, however, and the remarkable arithmetical puzzle whereby, making A. joint partner with B., you are to give valuable property to A. without taking any from B., did not enter into Mr. Forster's speech. What did enter into it was, in the first place, a challenge to Mr. Gibson. Mr. Forster is very sad on the subject of Mr. Gibson's remark that the Government did not sufficiently employ the ordinary law. His sadness does him credit, but the defect of memory

seems to be epidemic in the Cabinet, even among escaped members. Mr. Gladstone cannot, at least by hypothesis, remember the meaning of the Land Bill; the Duke of Argyll cannot remember that he ever heard of any Bill of disaffection before the action at Laing's Nek; Mr. Forster cannot remember any instance of insufficient use of the powers of the ordinary law last autumn and winter. This, however, was not by any means his most remarkable utterance. That the Irish Land Bill, which every skilled witness—hostile, favourable, and neutral—agrees in regarding as a measure certain to lead to endless litigation, is, according to Mr. Forster, the offspring of a desire "to give the lawyers as little work to do as possible," is a statement which, we are sorry to say, made the irreverent population of Bradford laugh. They are very rude in Yorkshire, and rather sharp; so perhaps it is, on the whole, more sad than strange that they should have laughed at Mr. Forster. He was, however, only going up his hill of paradox. Mr. Forster believes in himself as having vigorously used the ordinary law in Ireland six months ago; he believes in the Irish Land Bill as likely to make lawyers starve. But he believes in it still more as "a merely temporary departure" from the laws of political economy. Mr. Forster has not the noble confidence of his chief; he does not believe that laws of nature cease to operate within four hours' steam of Holyhead. But the interference is merely temporary, he urges. For a time, at least, a reluctant Government must interfere with contract. When the tenant has been nourished and heartened with a certain amount of his landlord's property, he is to fend for himself. This is a delightfully novel announcement. It certainly is not in the bond which announces that the new dawn of Irish prosperity is to broaden on from fifteen years to fifteen years without the least hint of a future relapse into the twilight of economy and sense. But even if there were such a hint, will Mr. Forster promise us that he will undertake the arrangement of the later order of things when the time comes? A bear robbed of her whelps is an awkward customer, but an Irish tenant suddenly bidden, after being brought up by the Gladstonian hand on his landlord's goods for years, to live by his own labours and in accordance with the laws of Saturn and Jupiter, is likely to be a customer far more awkward.

LORD DUNSANY ON INVASION.

IN the current number of the *Nineteenth Century* Admiral Lord Dunsany attempts the rather hopeless task of dispelling an idea very generally held by his countrymen, and tries to show that it is altogether erroneous and, indeed, absolutely opposed to facts, that is, to the facts of what he justly calls an iron age. The idea which he wishes to uproot and destroy is embodied in the phrase, a "silver streak," which means a great deal, like the shake of Lord Burleigh's head, and indicates not merely a strip of water, but also the absolute safety from invasion which is supposed to be due to that strip of water. That safety, says Lord Dunsany, is imaginary, and not only is it imaginary, not only does this country possess no special immunity from attacks, but that very Channel, that very "silver streak" which is thought her best defence against her foes, in reality makes it less difficult for a foreign Power to attack England than to attack a neighbour across a land boundary. This seems, at first sight, a startling paradox; but Lord Dunsany is able to say a good deal in support of it, and to bring forward facts very commonly overlooked, which can hardly fail to produce an impression on any one who is willing candidly to consider them; for they show, not perhaps that there is quite such imminent danger as the Admiral thinks, but that skilfully contrived measures on the part of an invader, aided by such good fortune as has marked many a campaign, might make the position of this country perilous in the extreme, and that, in the event of a war with one Great Power, a catastrophe worse than Sedan would certainly not be an impossible contingency.

In considering this question, it is necessary first of all to realize the enormous difference which steam has made, not merely in naval warfare, but in the transport of troops; and to this Lord Dunsany rightly directs his readers' attention. In former days, when troops had to be sent in sailing vessels, nothing like certainty, or approximate certainty, with regard to time was possible, and operations by sea were therefore in one respect much more hazardous and doubtful than operations by land. Now, not only is the position of things changed, but it is absolutely reversed. On this subject we cannot do better than quote the apt words in which Lord Dunsany compares operations by sea in former days with those which are possible now. He says:—

No great combinations such as an invasion would require, were possible in the days when the movements of a fleet depended on wind and weather. Could land forces even carry out any combined movements if they depended on wind or weather? Would the battle of Waterloo have been ever fought if "trusty old Blücher," instead of informing Wellington that he might rely on the support of the Prussian army on the 18th of June, had made that support conditional on there being no change of wind, no storm, no calm?

But with steam, armies escorted by fleets can be carried far more certainly, more rapidly, more conveniently, by sea than by land. In the late highly creditable march of Sir F. Roberts, his army covered seventeen miles per day, and has been very deservedly lauded for that performance. Had they been embarked, twelve times that distance would have been below an average rate, and fifteen times would have been possible. The voyage too, unlike the march, implies neither fatigue to the men or horses, nor any wear and tear of material. Our regiments sent to the Cape of Good Hope this spring traversed the Equator and penetrated far into the Southern

Hemisphere, say a voyage of 6,000 miles in less time and with infinitely less strain in every way than would have attended a march from end to end of this island. The march to the Cape by land would not have been effected (friendly territory) in a twelvemonth! But the strangest idea connected with the "Silver Streak" is that the transport of material by sea is an insurmountable difficulty! The refutation of this fallacy is the *argumentum ad absurdum*. If transport by sea be difficult, transport by land is impossible; therefore there can be no future war! Any one seeing for the first time a ship discharge a cargo, say of 2,000 tons, must have been astonished at the multitude of carts and baggage animals required, and the miles of road covered by that single cargo.

The truth of this is indisputable, and Lord Dunsany is also undoubtedly right when he goes on to argue that an opposing army would have enormous difficulty in preventing the landing of forces from ships, as these would be covered by the tremendous fire of modern naval guns; and in a later part of his article he states in detail the advantages which an invader by sea possesses over an invader by land. The former, says the Admiral, must concentrate, and the concentration must be observed; whereas, concentration by sea is extremely rapid. He must fix a base of operations, thereby revealing his line of attack, and he advances at the rate of from ten to fifteen miles a day, while steam-ships can easily cover 240 miles in the 24 hours. In some respects Lord Dunsany has, we think, underrated the difficulties of an invasion from over the water, and we shall endeavour to point out how considerable those difficulties are; but there can be little doubt that an invader by sea would now possess certain considerable advantages over an invader by land, and that it is absurd to look on the "silver streak" as giving any special immunity to this country. Lord Dunsany might have strengthened his argument by pointing out that an embarkation is a much more safe and easy thing now than it was formerly. In the old days an admiral had to be careful how he anchored his fleet off an open coast in doubtful weather. The ships might have to make sail at any moment, and it was necessary to be at some distance from the shore. Steam-ships, of course, may be lost by a lee-shore if caught by a furious gale; but for powerful war-ships, and great transports, the danger is comparatively very small, at least in summer-time, and it is not very likely that an invasion would be attempted in the winter. One risk, therefore, which formerly accompanied the landing of troops may be considered now to have disappeared.

It seems clear that Lord Dunsany's view is right, and that the favourite expression the "silver streak" represents a most dangerous fallacy, inasmuch as an attack from the sea, which was in other times so difficult as to be well nigh impossible, is now a perfectly feasible operation of war, and is, in some respects, less difficult than an attack by land. It is only fair to say, however, that there is another side to the question, and this Lord Dunsany appears to overlook. Carefully as he has considered the matter, he scarcely seems to see that certain of his arguments cut both ways, and that some of the indisputable facts which he brings forward are as much in favour of the invader as of the invader. Steam has immensely facilitated attack, but it has also greatly facilitated defence. In the old time a foul wind or a calm might neutralize defence, and might make a fleet for a time utterly useless. Now this risk, quite as great for the invader as for the invaders, no longer exists, and the time which will be necessary for a fleet to reach any given spot can be calculated in a few minutes. If the movements of one antagonist are far more rapid and certain, so are those of the other. A port can be much more effectively watched or blockaded by steamers than by sailing ships; and in many ways intelligence of an enemy's movements, which formerly was obtained with great difficulty, would now be rapid and complete. Then we cannot but think that Lord Dunsany somewhat overrates the facilities for naval concentration as compared with the concentration of an army. It is war with France that he principally considers; and we believe that it would be perfectly impossible to concentrate a great fleet of war-ships and transports in French ports with the rapidity and secrecy which he seems to think practicable. He is of opinion that a French army corps, with all its material, could embark in forty-eight hours, and that four or five corps "might very conceivably be embarked in the ports of Toulon, Marseilles, Rochefort, L'Orient, Brest, and Cherbourg." Lord Dunsany has very carefully studied the question, and is no doubt right in these assertions; but it must be remembered that a strong squadron would be required in each of these ports to accompany the transports when they sailed, and it is impossible to suppose that the concentration of war-ships and transports would not be known to our commanders, and that the ports would not be carefully watched by English fleets. Moreover, it must be remembered that a squadron which is conveying transports is at a peculiar disadvantage if attacked at sea by an equal force. The officers in command of ships would have to think, not merely of fighting them in the most effective way, but also of protecting the convoy; and the very slightest error in judgment on the part of any individual captain might mean the annihilation of two or three regiments, as but a few shots from big guns would be required to sink a transport. The same difficulty would be felt by the French commanders in any such great naval action as might be fought if a mighty concentration was successfully effected. Their fleet would consist of a certain number of war-ships and of a certain number of unarmed ships easy to sink and crowded with troops. A comparatively small preponderance in force would give a great practical advantage to the fleet which was encumbered by no convoy.

These facts we cannot but think that Lord Dunsany has over-

looked; but, if his arguments are to some extent assailable on this account, there can be no doubt that, on the whole, they have great weight, and are well worthy of what we venture to predict, they will not receive, the attention of Englishmen. Steam, which has utterly changed naval warfare, has enormously increased the attacking power of an invader by sea. It has also increased the defensive power; but, on the whole, the advantages are on the side of the assailant. The invasion of England by the sea, formerly all but hopeless, is now a perfectly possible operation of war, and though it must of course be attended by great risk, this is not more than the risk of some military operations. The balance of risks, indeed, is against this country. In a great naval action the invader might lose a fleet and an army; but, on the other hand, his success might mean the subjugation of England. Able to anchor where he pleased, while our tiny army toiled after him in vain, the only thing the invader would have to consider would be the likelihood of finding torpedoes in his way, and it is hardly conceivable that every landing-place on the south coast would be efficiently protected by these engines, which, moreover, can be removed or destroyed. On what would happen if an army greatly exceeding our own in strength once landed we have no wish to speculate, and we do not wish to follow Lord Dunsany in his gloomy account of a probable advance from Pevensy Bay. This much, however, is certain. If such an army as one of the Great Continental Powers could dispatch with ease were landed in this country, the occupation of London, and the consequent annihilation of the whole power of England, might follow within a short space of time.

It is not a little curious that in this matter practical views based on carefully ascertained facts and figures, which cannot by any possibility be denied, are treated as dreams, while a feeling of security which is based on nothing is regarded as a proof of strong sense and of just contempt for visionary ideas. In reality, the visionaries are those who place reliance where there are no grounds for reliance, and whose opinions are based on a superstition and a phrase. Because at one time in our history the British navy was stronger than those of all the other European navies put together, it is thought to be comparatively powerful still, and people are content with the idea of safety conveyed by the words "a silver streak." Now it is pointed out by Lord Dunsany, and has been pointed out before, that the French have been twice ahead of us, have twice possessed a navy stronger than ours, and it is doubtful whether at the present moment their navy is not equal in strength to ours. Even if it be inferior, there can be small doubt that France could put more powerful war-ships into the Channel than we could, as so many of ours must necessarily be detached on distant service. Surely, then, Lord Dunsany is right in drawing the conclusion that, in the event of a war with France, there would be danger of a catastrophe worse than Sedan. The fancied superiority of our navy no longer exists, and our fleet might have to encounter in the Channel a fleet of greater strength. Of what might, and very likely would, happen if England found herself at war with two naval Powers, it is scarcely necessary to speak.

Real, however, as are the dangers of which Lord Dunsany speaks, his article will, we fear, attract but little attention. When disagreeable arguments cannot be confuted or disagreeable facts denied, Englishmen frequently console themselves with a phrase or a catchword. The use of the word "alarmist" is thought sufficient to silence those people whose unpleasant statements cannot easily be met in detail. Lord Dunsany has, perhaps, given some excuse to those who love to use this word, which is thought to answer everything. He has, as we have shown, overlooked some facts which tell against his views, and has not perhaps given sufficient weight to others; and, though he is undoubtedly right in the main, he will probably, if he receives any attention at all, be pronounced an alarmist, and therefore unworthy of attention. An alarmist he certainly is; and a Frenchman would have been an alarmist who had said during the great days of the Empire that the military strength of France was far below that of Germany, and that a war would swiftly result in French armies being shattered, France overrun, and her capital beleaguered. Alarmists may sometimes be right.

MR. FROUDE'S IDEAS OF LITERARY TRUSTEESHIP.

THE curiosities of literature in ancient and in modern books enrolled are numerous. But since the famous collection of them we do not know that a more remarkable addition has been made to the list than the correspondence between Mrs. Alexander Carlyle and Mr. Froude, which was laid before the readers of the *Times* at the end of last week and the beginning of the present. We do not purpose saying much about the *Reminiscences* themselves, which were quite sufficiently dealt with in these columns at the time of their appearance. The unfavourable reaction which they seem to have produced in the general judgment of Mr. Carlyle seems to us thoroughly irrational, but at the same time thoroughly of a piece with the general instability of judgment on almost all points which characterize public opinion at the present day. That a man in extreme old age, a notorious sufferer from the complaint which of all complaints sours and warps the judgment most, having lost his principal friend and stay, and looking at the world in general in one of those moods which he has himself described as "sour of stomach and of heart," should write (with hardly more deliberate purpose than if

he were speaking) unadvisedly and sometimes ungenerously is nothing very unintelligible or very horrible. That these writings should be flung unedited on the world within a week or two of his death was, indeed, not a little unintelligible. The matter was made still more difficult of comprehension by the publication of Mr. Carlyle's will, in which, though complete discretion was nominally left to his literary executor, the expectation that considerable time would be allowed to elapse before any of these papers would be published, and that then only a very small portion of them would be found fit for publication, was expressed so clearly that, to any ordinary person, it would have had the force of a command. Mr. Froude's conduct then became doubly curious. He had published what most people would not have published at all except in pursuance of a stringent and explicit mandate for its publication, and he had published it directly in the teeth, as it seemed, of a recommendation not to do so which was almost equivalent to a mandate. This was how the matter stood when Mrs. Alexander Carlyle's first letter appeared in the *Times* of Thursday week. It is scarcely too much to say that this letter must have made wonder give place to indignation in most people's minds. Mr. Carlyle's niece had not, it appears, seen the Jane Welsh Carlyle note-book, though she had constantly heard her uncle speak of it. Her first actual sight of it took place last week, when Mr. Froude sent her back the manuscript. At the end thereof she found a note in her uncle's handwriting which may be thus summarized in the very words of the original:—"I mean to burn this, but cannot make up my mind. It may interest friends who come to it with worthy, not unworthy, curiosity. I solemnly forbid them, one and all, to publish it as it stands here. I warn them that no part of it is fit for printing without editing, and that nine-tenths cannot even be edited by any one save myself." It is, of course, impossible to imagine a more solemn prohibition than this. For flying in the face of it, Mr. Froude, it seems, alleged subsequent oral communications, though how vague those must have been is shown by his own remarks, that Mr. Carlyle "wished it to be published, though he would not order it." Therefore, on the face of this first letter, the matter stood thus. Here was a most definite prohibition acknowledged never to have been reversed by a subsequent order. Mr. Froude is convinced that Mr. Carlyle did not mean his prohibition; Mrs. Carlyle, that he did. So much for document number one. Document number two is Mr. Froude's reply, a reply not calculated to remove the impression created by Mrs. Carlyle's letter. Mr. Froude assumes in it the mysterious "I could an if I would" air which is, perhaps, not very infrequent in such cases. His task is very difficult; he did not seek it; he is very reluctant to give further explanations; he would gladly be spared the necessity of explanation. All which, of course, comes to simply nothing. The only positive facts and tangible statements in the letter are, that ten years ago Mr. Carlyle insisted that nothing should be published for ten years (as he was then a man of seventy-six, the meaning of this ought to be clear enough), and that he never said anything more about it, except in his will, where, as has been said, though the exercise of Mr. Froude's discretion is formally permitted, it is conditioned in a very striking manner. Naturally Mrs. Carlyle did not leave the matter in this state. She wrote again, inviting Mr. Froude to explain his mysterious allusions and innuendoes, giving a quotation from a curiously petulant letter which he had written to her almost immediately after her uncle's death, and finally challenging him to surrender the whole collection of Carlyle papers, to be decided upon by a jury of three friends, in accordance with the terms of the will, if the task of editing was so irksome to him. Mr. Froude's reply is in a very different tone to his first letter. He is not at all mysterious now. The memoir of Jane Welsh Carlyle and Mr. Carlyle's letters are his personal property, and he is going to do with them exactly what he pleases. As for the rest, he is quite willing to restore them; they are a great nuisance to him; he has reason to complain of the position in which he is placed with regard to them; nobody sent him a proper inventory; he was told that the more he burnt of them the better. But Mrs. Carlyle may have them all if she likes, and Mr. Froude will take no further notice of anything said about the troublesome things.

We have no desire to be hard on Mr. Froude. He has done a good deal of service to English literature and English history in his time, and he has sometimes been attacked with perhaps rather more severity than the case required. His worst fault has always appeared to careful critics to be a kind of mental inaccuracy or haziness which has occasionally produced awkward slips. We must say that in this correspondence this particular feature appears very strongly, though in a new form. The questionable character of Mr. Froude's conduct, as shown by his publication of the *Reminiscences* and by his correspondences with Mrs. Carlyle, is twofold. In the first place, he has done a thing which was doubtfully judicious if it was authorized; in the second, he has done a thing which he apparently finds it impossible to prove was ever authorized at all. Mrs. Alexander Carlyle has produced a clear and categorical statement of her uncle's forbidding the publication, and Mr. Froude himself admits that no order reversing that prohibition ever came from Mr. Carlyle even orally. All he can say is that he was to use his own discretion about it. It is clear that, granting his facts, his discretion remains on trial; it is not so clear that we have any right to grant his facts. But whether this be so or no, it is difficult to find words within the limits of courteous expression to describe the general tone of Mr. Froude's two letters

to the *Times*. Even if he is absolutely strong in the consciousness of his own rectitude, he must know that he has given grievous cause to Mr. Carlyle's relatives and friends to complain. They cannot but consider his discretion most indiscreet, his interpretation of their dead friend's wishes most erroneous. Yet he has no kind of apology or friendly excuse to make. He does not even vouchsafe the grounds on which he came to a conclusion in such a remarkably short space of time, and when it would appear a whole mass of documentary evidence, some of which might very conceivably have affected his determination, was yet unarranged, if not unperused. On the contrary, he makes petulant complaints of the inconvenience to which he has been put, and—still worse—indulges in mysterious hints that, if he is pressed, something very terrible will happen. It is not clear whether Mrs. Carlyle's peace of mind or her uncle's reputation, or the happiness of unknown third parties concerned in unpublished documents, is threatened in this mysterious dagger-and-domino fashion. But it is clear that the thing is in execrable taste; while the allusion to the letters and memoir being Mr. Froude's own property is hardly better. Legally, he may be right; morally, documents of this sort cannot possibly pass into the hands of an outsider without a certain lien upon them remaining to those who are interested by blood, by affection, and by long association with the persons originally concerned.

On the whole, it must be said that Mr. Froude has been wrong either in breaking silence at all, or else in shutting his mouth after these very unsatisfactory utterances. Mrs. Alexander Carlyle's letter was not only a very natural one, but it was not in the least offensive in tone; it told the readers of the *Reminiscences* what they had a right to know (and what, we may add, if it had been read before the book, might have induced some readers with old-fashioned ideas of honour to leave that book unread); it gives Mr. Froude's excuse fairly enough—indeed, it gives that excuse a good deal more straightforwardly than the person directly concerned has given it over his own signature. It did not even demand a further explanation, though it invites it, as most assuredly the writer had a right to do. How Mr. Froude meets this proceeding we have seen. Insinuation, complaint, roundabout assertion, and but one plain statement of fact—the statement that he has done, and means to do, what he likes with his own. The whole attitude is as little like that which might be supposed to be becoming in a reverent keeper of a precious deposit as any that can well be imagined. The original publication of the *Reminiscences* was, beyond all question, an error in judgment and taste. It could only have been instigated by a willingness to satisfy the kind of curiosity which Mr. Carlyle himself has distinctly stigmatized as unworthy, and not to be gratified. The haste with which it was accomplished deprives the guilty party of any remnant of excuse which he might have had if, observing proportionately the restriction which he acknowledges to have been laid on him, even when the positive prohibition was taken off, and which he broke in the spirit, if he kept it in the letter, he had waited for a certain term of years to elapse. But, having done this, there could be no possible necessity for him to adopt the attitude which he has subsequently adopted. His proper course evidently was to say, "I am very sorry if I have hurt any one's feelings; I have acted to the best of my judgment, and to that judgment I adhere." Instead of this, according to a habit very common with children and women, but supposed by the arrogance of man to be rare in full-grown and tolerably intelligent specimens of the sex which fights and counsels, he raises counter-accusations, tries to create a kind of cuttle-fish screen of dark insinuation, under cover of which he may get off, and finally, while refusing to give up his property, offers to throw up the really important task of co-ordinating the whole mass of Carlyle documents into a regular and complete biography. For this last act, ungracious as it is, there is perhaps some reason for being thankful to him, and it is sincerely to be hoped that Mrs. Alexander Carlyle will accept the offer. In mere literary faculty Mr. Froude is, indeed, an expert; but if this realm does not quite baffle five hundred as good as he, it holds a quite sufficient number. In every other qualification for the work, except the personal intimacy of which he has made such unfortunate use, he would appear to be wholly deficient. Besides, he has already earned Shakespeare's curse quite sufficiently, and perhaps a little of it has come upon him already in the remarkably sorry figure he cuts in this present dispute. "His bishopric let another take" will probably be the cry not merely of every admirer of the great man of letters whom we have lost, but also of every lover of fair play and good taste in matters literary.

THE LAST PUBLIC DECLARATION OF LEO XIII.

THE Pope replied the other day to an address, presented to him with great ceremony in the Consistorial Hall of the Vatican, by a deputation from various Catholic societies in Rome united under the name of *Federazione Fiani della Società Cattoliche di Roma*. His discourse was not indeed an Encyclical or an Allocution, in the technical sense of the terms. But considering that the Papal organs describe the occasion as being one "such as has not been witnessed since the accession of Leo XIII.," and that the deputation alone included more than ten thousand persons, we may fairly attribute to the public and deliberate reply of his Holiness a significance not at all inferior, to say the least, to that of a more formal utterance. We are carefully informed how for

two hours on that Sunday morning all the passages to St. Peter's were occupied by continuous streams of carriages conveying the deputies to the Vatican; how the Bridge of St. Angelo was blocked by three lines of vehicles; and how no single building in the Vatican, except St. Peter's itself, could contain the multitude, who were therefore distributed over various halls and *loggie*, the grand reception being held in the Consistorial Hall, where the Pope appeared surrounded by some twenty Cardinals and a host of minor dignitaries and officials of his Court. It is described as "a demonstration of loyalty and devotion to the Sovereign Pontiff on the part of the Roman citizens" unparalleled since he ascended the throne, and "a convincing proof that the policy of the present occupant of the Chair of St. Peter commends itself to the judgment of rich and poor alike." It becomes therefore a matter of some interest to ascertain what that policy is, as expounded by his Holiness himself on an occasion of exceptional splendour and publicity, when he must of course have been well aware that, in addressing the vast audience before him, he was really, though not officially, speaking *ut et orbi*. The *Tablet*, in commenting on the address, begins by insisting, as for obvious reasons it was bound to insist, that "the Holy Father, once more solemnly maintaining the inalienable and indestructible rights of the Pope-King over his city of Rome, declared anew that Rome belonged to the Roman Pontiff." And it is quite true that a strongly-worded—and no doubt intentionally so worded—passage to this effect does occur in the discourse. But even the *Tablet* is obliged to admit, what cannot fail at once to strike any intelligent reader, that "it was to the duties of Catholics, in face of the unceasing activity of the enemies of religion, that the Pope mainly directed his advice," and that while he was primarily addressing Roman citizens, "his words were calculated to address an identical lesson to the Catholics of Europe at large, and indeed to all classes of men separated from the Church who still cling to the natural foundations of social order." In other words, he addressed himself chiefly to questions of interest to all Christians and good citizens, quite irrespectively of their views about the Temporal Power of the Pope. Now this is certainly the fact, and it remarkably bears out the view which, as our readers may recollect, we have ourselves repeatedly, and from the time of his accession, expressed of the aims and policy of the present pontiff. It has however been again and again objected, from more than one quarter, but especially of course by ultramontanes, and not least in the columns of the *Tablet*, that this view is an entirely mistaken one, and that there is no real difference whatever between the spirit and policy of Leo XIII. and Pius IX. When indeed within a twelvemonth of the new Pope's election Dr. Newman, who—to speak plainly—had been for years the *bête noire* of the Roman Curia, was raised to the purple, men's eyes were opened for the moment to the true state of the case, but it was soon found most convenient to argue that after all this proved nothing at all; that Dr. Newman's sentiments had been quite misrepresented and were really in full accord with those of the "insolent and aggressive faction," as he once called them, dominant under the last pontificate; and that Pius IX., had he lived a little longer, would no doubt have done what during a reign of thirty-two years had oddly enough never occurred to him, and would himself have decorated his most distinguished subject with the purple. "There is nothing so delusive as facts, except figures," and though all the facts pointed one way, that was no reason for assuming that the truth was not to be looked for in a precisely opposite direction.

Those who so argue will make the most of one clause in this last pontifical pronouncement, already referred to, where the Pope declares in somewhat rhetorical phrase that "by many titles, all of them glorious, Rome appertains to the Roman Pontiff . . . and therefore the rights which the Pontiff possesses over Rome are so sacred and imprescriptible that no human forces, no political reasons, no lapse of time, can destroy them, nor in the least diminish or weaken them." Now on this passage, the language of which is no doubt emphatic enough, especially the words we have italicized for reasons that will appear presently, there are one or two remarks to be made. In the first place it is sewed in, so to speak, like a *purpureus pannus*, into an address dealing with other and more practical subjects which would lose nothing of consistency and sequence by its omission. In the next place the very strength of the wording, and notably the statement that "no lapse of time can destroy" the claims of the temporal power, looks much more like the formal and somewhat perfunctory discharge of an official duty than the assertion of a principle to which the speaker attaches any practical interest or significance. Nothing could well be more unlike what we hope it is not disrespectful to the memory of Pius IX. to call the *femine ululatus* wherewith he never missed an opportunity of bedewing his fallen crown during the last seven years of his reign, as for some ten years before he had never ceased to denounce in the liveliest terms the robbers and rebels who were conspiring to snatch it from him. And there are obvious and very intelligible reasons why Leo XIII. should have taken advantage of such an occasion as "the great demonstration of loyalty and devotion" the other day for putting on record an official protest against the loss of his civil sovereignty. The party of high prerogative, sedulously nursed into power and fanaticism during a papacy of unprecedented length, could not be snuffed out by the mere breath even of an infallible potentate, had he desired it, and it was too influential to be safely ignored. There were ominous rumours a year or two ago of a falling off of Peter's Pence from the bare suspicion of the new Pope being unsound on this cardinal point of Papal ethics, and as the party

who held the purse-strings were the same who pertinaciously forbade the Pope to accept the liberal subsidy offered by the Italian Government, the difficulty threatened to be a serious one. It will perhaps be replied that no such considerations can justify or explain the Pope's solemn affirmation of principles he does not believe to be true, and therefore personal respect for Leo XIII. constrains us to admit his identification of sentiment with Pius IX. But here the magical formula of the schoolmen, "*distinguendum*," comes in with all its force. There is no reason to suppose that Leo XIII., trained from boyhood in the inexorable traditions of the Roman Curia—incomparably the oldest, subtlest, narrowest, and most tenacious school of traditional juristic lore existing anywhere in the present age—does not conscientiously believe in the "imprescriptible rights" of the Papal Sovereignty, and is therefore not able with a good conscience to proclaim that belief, when there is adequate ground for doing so. But it may be equally true that he is not anxious to dwell upon the claim, and would shrink from any public assertion of it without some special ground. We may find a parallel in what Dr. Newman says about himself in the *Apologia*. He tells us how he was charged with insincerity for his denunciations of Rome and Romish teaching in his earlier Oxford works, and all the more so because he had declared such denunciations to be "necessary for our [Anglican] position." But his reply is a very simple one. He had not said a word against Rome which he did not at the time believe to be perfectly just, but yet it appeared to him so grave a matter for an individual writer to stand up and assail a vast religious Communion, comprising above half the Christian world, that he might have shrunk from openly avowing his belief, had he not known that he was but following a whole *catena* of Anglican divines of former ages, and that the principles he sincerely desired to see acknowledged in the Church of England had no chance of success unless it could be shown that they were free from all taint of Romanism. And thus it was "necessary for our position" to say openly what he might not otherwise have expressed, but would equally have held to be true. Leo XIII. may plead in the same way that he finds it necessary for his position to make a public assertion of claims which he fully believes to be just in the abstract but which, apart from this special and circumstantial necessity, he would have preferred to pass over in silence. As a Pope and Roman prelate he naturally believes in the imprescriptible rights of the temporal Papacy, and he recognizes strong reasons of expediency for giving formal expression to this belief at the present moment. But being not only a Roman prelate, but a man of intellectual and historical culture and a statesmanlike mind, he is well aware that the altered relations of the spiritual and civil power in Italy, however deplorable, represent part only of a general change which is passing over the face of European society, and he probably more than half suspects that, for any period calculable by human foresight, the change is likely to be a permanent one. And therefore while recording, for sufficient reasons, his solemn protest against any lapse of time being held to bar the claim, should an opportunity for reviving it ever occur in the future, he wisely sets himself to provide for present emergencies without further reference to abstract ideals which may or may not enter into the practical politics of his remote successors.

It is at least entirely in this spirit that the remainder of the Address is conceived. "I don't want to know," a Bishop is reported to have said to a candidate for orders reputed to hold extreme opinions, "what you think about abstruse questions of theology, but what sort of doctrine you mean to preach to your people, and how you will treat the children who come to you to be prepared for Confirmation." If we judge the last Papal discourse by the common-sense test, not of what it formally lays down about imprescriptible rights, but of what kind of practical instruction it conveys to the faithful, it will be found to bear out entirely the character for statesmanlike moderation and sagacity which so markedly distinguishes the present Pope from his predecessor. After asserting his resolve to defend and protect inviolate all the rights of his See, and the duty of his beloved children to "cooperate in this most noble endeavour," he goes on to draw the practical lesson, not that they ought to scheme for the overthrow of the Italian Government, but that they should strenuously resist in their own persons and their families the elements of corruption rife in modern society, and this especially by securing the Christian education of the young, and "by means of a respectable press." The only advice that can be in any sense termed political is based not on a repudiation but an acceptance of the established order of things in Italy. "Inasmuch as, together with Catholic interests, those of the family and of society are now menaced, it is necessary that you should defend them also, by carrying your action into the field of the municipal and provincial administrations, the only one at present open to the Catholics of Italy." There is an exhortation to meet the socialistic and irreligious organizations of the day by multiplying Clubs, Committees, and Societies of an opposite kind, and an earnest recommendation of the supreme importance of working together in Christian unity and concord. On this suggestion the *Tablet* takes occasion to observe—rather unkindly to its Irish friends—that Mr. A. M. Sullivan and M. Victor Hugo, the chosen associate of Mr. Parnell, as well as Mr. Bradlaugh and Mrs. Besant, are members of the Executive Committee of the Democratic League, an agency of Atheism and Revolution, which necessarily falls under the pontifical censure. The Pope however refrains from naming any particular societies,

and contents himself with a general warning against tendencies which no thoughtful man, Roman Catholic or Protestant, will deny to be at this moment operative in many countries of Europe and fraught with serious peril to the State and the family no less than to the Church. There is nothing in all this which might not be said, and has not been said over and over again in substance, by prelates, preachers, and religious writers of various kinds among ourselves. But it comes of course with a fresh force from the lips of the pontiff in the Consistorial Hall of the Vatican, and contrasts, both in its positive and negative aspects, strikingly enough with the endless torrent of denunciations, reclamations, lamentations, and more than Carlylese anathemas of things in general, which used to "go on for ever" in the Vatican of Pius IX. It is a little unreasonable perhaps to blame Leo XIII. for not making formal overtures of reconciliation to the Italian Government, even supposing no difficulty need be apprehended—and the difficulty would most likely prove very considerable on both sides—in arranging the terms of a Concordat. To this day, if we are not mistaken, every episcopal Consecration at Westminster Abbey commences with a formal protest of the Dean's, handed down from mediæval usage, against the intrusion of the Bishops into his own privileged domain, after which preliminary ceremony he quietly proceeds to take the part assigned him in the service. The formal protest of the Pope against the forcible occupation of his States can appeal to the same sort of venerable antiquity, and is similarly "a tale of little meaning, though the words are strong." It meant a good deal in the mouth of Pius IX., as far as his own will and intention were concerned; it means in the mouth of Leo XIII. that, while he is a pastor, politician, and philanthropist, he does not forget that he is also a Pope, and that his high office has picturesque precedents to respect, as well as practical duties to discharge. The more thoroughly the duties are carried out, the sooner will it become possible to consign the precedents to oblivion.

TRAINED ELEPHANTS.

ONE of the late Canon Kingsley's favourite stories was of a certain Devonshire farmer, who, narrating to the clergyman of his parish the wonders of a "menagerie" which he had visited, declared himself chiefly delighted with the "Great Zugazaius." The clergyman asked for an explanation, when the farmer exhibited the "playbill," on which appeared in large letters the words, "The Great Sagacious," followed by a picture of an elephant. If half the stories which are told of them be true, elephants certainly have a pre-eminent claim to this epithet, for they not only at times display an amount of intelligence which is almost human, but they appear to have a keen sense of the humorous as well. Who does not remember the elephant of juvenile story, which drenched the Oriental tailor with water in return for a malicious prick with a needle, which the latter had given him instead of his usual eleemosynary bun? Or that other one, celebrated by Wilhelm Busch, of Münchener Bilderbogen fame, which followed and caught the mischievous negro who had shot at it, and, after frightening him in various ways, dropped him into a prickly-pear bush? The latest account of elephantine 'cuteness' comes from Philadelphia, where P. T. Barnum has a show with twenty of these animals. Half of them are already trained and hail from England, while the others are described as American—by domicile, we presume, for we have never heard them included amongst the indigenous fauna of the New World. Be that as it may, the American elephants were envious of their companions' accomplishments, and set to work with such goodwill to emulate them, that they were frequently detected practising in private, and standing upon their heads and performing other feats during their leisure moments or when alone. These same performers, we are also told, having been exposed to a snowstorm, were seized with severe shivering fits, to remedy which four gallons of Bourbon or Old Rye were administered to each, with excellent results—though it certainly does seem rather "a stiff glass of grog." At the end of the next day's journey the "troupe" again displayed alarming symptoms of a chill, and shivered and groaned with marked emphasis, although the weather was exceptionally mild. This time the keeper sternly exclaimed, "Not another drop!" and the shiverings ceased. From all which we gather that the veteran showman is keeping up his reputation, and that American institutions sharpen the wits of elephants as well as men.

The sagacity of these animals was noticed by very early writers. Strabo says:—"Few of them are difficult to tame, for they are naturally so mild and gentle in their disposition that they approximate to rational creatures. Some take up their drivers when fallen in battle, and carry them off in safety from the field. Others, when their masters have sought refuge between their forelegs, have fought in their defence and saved their lives. If, in a fit of anger, they kill either the man who feeds them or the man who trains them, they pine so much for his loss that they refuse to take food, and sometimes die of hunger." A curious proof of the accuracy of this assertion is afforded by the fact that the old Indian elephant at the Zoological Gardens in Regent's Park some years ago did actually pine to death at the loss of the keeper who had long attended to her, and to whom she had become greatly attached. Alian gives the following account of elephant-taming in India in his own time:—"An elephant, if caught when full grown,

is difficult to tame, and, longing for freedom, thirsts for blood. Should it be bound in chains, this enervates it still more, and it will not submit to a master. The Indians, however, coax it with food, and seek to pacify it with various things for which it has a liking, their aim being to satisfy its appetite and soothe its temper. But it is still angry, and takes no notice of them. To what device do they then resort? They sing to it their native melodies, and soothe it with the music of an instrument in common use, which has four strings, and is called a *skindapeos*. The creature now pricks up its ears and yields to the soothing strain. It is then freed from its bonds, but does not seek to escape, being enthralled by the music. It even takes food eagerly, and, like a luxurious guest rivetted to the festive board, has no wish to go from its love of music."

The present method of hunting wild elephants with trained females as decoys is almost identical with the ancient method as described by Arrian in his *Indika*, and he, too, mentions the use of music as an infallible means of soothing their savage breasts. One of P. T. Barnum's elephants amuses the audience by entering the arena, fanning itself with its trunk, and subsequently stealing the keeper's pocket-handkerchief to wipe its face withal. The first-mentioned trick is, to a certain extent, natural to the animal, since it is a well-ascertained fact that it will in a state of nature break off the branch of a tree and use it as a fly-flapper to rid itself of troublesome insects. This is one of the rare instances known of an animal actually employing a tool to supplement or assist the members which nature has given it. The sly and somewhat unprincipled conduct with regard to the whisky, for which Mr. Barnum vouches, is also not without parallel; for it is well known that elephants employed, as they frequently are, in dockyards and elsewhere in India, will work hard if promised extra rations, but will shirk work and deliberately idle away their time if left for a short time without being overlooked. Innumerable stories are on record of their powers of reflection and minute observation. One large female elephant, who had for a number of nights taken part in a certain dramatic pageant, steadily refused on one occasion to re-enter her "dressing-room," which had been built just outside the theatre, nor could threats or blows induce her to move; when it was discovered that one of the planks leading up to the building had given way, and that the approach was insecure.

The following incident, related by M. Louis Rousselet in his magnificent volume *India and its Native Princes*, is another proof of this extraordinary faculty. "We found ourselves," says the author, "facing a precipice the sides of which descend almost perpendicularly for about fifty feet. A path, scarcely practicable for pedestrians, over the different windings of the rock, presented itself to us. It seemed utterly impossible that an elephant should venture on this mere goat-walk; the mahout, however, assured us that his animal would accomplish it. After a thousand admonitions shouted at him by his driver, the elephant commenced his perilous descent. To see with what care he balanced his body! to observe the dexterity with which he put his four feet together on blocks scarcely large enough to hold them! The only sign of agitation he exhibited was a slight tremor which shook his whole body. The rock of reddish sandstone projected in huge masses suspended over the abyss, on which we were compelled to step, and before venturing on these blocks the elephant convinced himself whether they were capable of bearing him by weighing on them with his forelegs repeatedly, without, however, risking the equilibrium of the rest of his body, which was thrown backwards. We were only a few feet above the bottom, when the mahout, impatient at these delays, raised his pike to strike the elephant, and at the same time the enormous stone over which he was urging him, yielding to the repeated efforts of the intelligent beast, got detached, and rolled down with a crash. A moment more and we should have all perished in a frightful fall; the sagacity of the elephant had saved our lives."

But the course of training elephants does not always run smooth, and when the animal is really refractory the keepers have "a heavy hand" with their charge. The most usual method of persuasion employed, when coaxing and feeding have failed, is, we believe, to "job them with a pitchfork till blood is freely drawn"; at least, this was the explanation given by a trainer of repute of his own practice in his gentle art, and it accords with Strabo's assertion, that "to prevent them shaking themselves in order to throw off those who attempt to mount them, they [the ancient Indians] make cuts all round their neck and then put thongs of leather into the incisions, so that the pain obliges them to submit to their fetters and to remain quiet." Under this or similar treatment an elephant can be made to exhibit the greatest docility in the arena, and will show a touching devotion to his keeper which cannot fail to render the circus at which he is employed as moral an exhibition as Artemus Ward's own celebrated "Snail." We have seen an elephant trainer put his head in the mouth of one of his *protégés* during a performance, when the brute obstinately kept its mouth closed, and was only induced to change its mind by a violent kick upon the trunk from a pair of heavy boots. No doubt, this "little eccentricity" was followed by summary and severe punishment; but, we must confess, that to so intelligent a creature as an elephant, the insertion of a human head into its mouth must have seemed such an idiotic proceeding that a little hesitation as to what to do with it is quite allowable. In Baroda, under the late Gaikwar's rule, a huge elephant was kept as the public executioner, and used to despatch poor wretches, at the word of command, by crushing their skulls with his enormous foot. Perhaps this elephant may have imagined that some

such duty was expected of him, and was merely turning the matter over in his mind.

When an elephant is callous, even to the gentle persuasion of the pitchfork, and goes "must"—that is to say, hopelessly depraved and rampant—there is only one kind of influence which can be advantageously exercised, and that is to "influence his head off," or, at least, to adopt the handiest available form of euthanasia. The poor old historical elephant of the Royal Exchange, maddened by toothache, had to be treated by a firing party of soldiers; and another submitted to about a quart of prussic acid, entailing fatal consequences to a butcher who had been called in to assist in its subsequent dissection. As a rule, they are very patient under pain, and easily recognize the fact that any proposed operation is "for their good." There are two elephants at this moment in the Zoological Gardens who have submitted to surgical treatment, the one for an accident which tore off a portion of its trunk, the other for an abscess in the face. The ancients also knew how to treat sick or wounded elephants; and Ælian, in the passage already quoted, gives an elaborate description of the therapeutics employed, dwelling at the same time upon the *gratitude* which the creatures evinced when cured. On the whole, we need not wonder that Ganesha, the Hindu God of Wisdom, is represented with an elephant's head to symbolize the possession of extraordinary sagacity.

THE DECLINE OF THE SWORD.

A KIND of funeral panegyric on the sword is pronounced this month by an enthusiastic and partly fantastic writer in *Blackwood's Magazine*, wanting neither in eloquence of the exuberant kind nor in ingenious conceits. To some of his fancies we may presently return. But his main argument is that in respect of honour and esteem the sword has become a thing out of date; or rather this is the theme assumed by him as the subject of his variations. It is not difficult to show that the assumption is in more than one way paradoxical. For, if we look simply to fact, we shall find that the sword continues a weapon of war, and is like to do so, the latest inventions in tactics having rather magnified than diminished the office of cavalry. We have heard of military reformers who would like to make the pistol the trooper's principal weapon; but the sabre holds its own for the present without much fear of disturbance, and in our own times has done feats of no small renown at Gravelotte and elsewhere. If we take it from the side of sentiment, the sword has lost nothing of its poetic and symbolic dignity. Now as much as heretofore it is an emblem of state and power, of protection to the right and terror to evil-doers. For us no less than for the Hebrew poet or annalist its name gathers up all the qualities and powers of armed force as the name of no other weapon can. It is remarkable that, while we habitually speak of appealing to the sword in a just cause, we do not in this way dignify cannon or bayonets. If we use them as symbols, it is mostly with a suggestion of wrongful violence or tyranny. A dominion maintained by the sword and a dominion supported by bayonets are, for what the terms signify in themselves, much the same thing; but they do not convey exactly the same meaning. Again, if we look to swordsmanship as an art, we see that it has gone on steadily improving for three centuries, and has room left for improvement yet. The use of the point alone, which we pre-eminently call fencing, may have been brought pretty near its greatest attainable perfection; what remains to be done, at any rate, is more in the way of simplifying than of inventing. But the combined use of the point and edge, which is precisely the function of the military sabre, has been so much left in the background that the study of it must be said to be still young. We think it may safely be affirmed that military swords are now far better made and better handled than they were a century ago; but the common instructions are still ridiculously meagre and faulty. The historical aspect now briefly indicated is glossed over, if not perverted, by the ingenious essayist in question, who speaks of fencing as if it had been born full-blown—"instantly great, suddenly magnificent," are his words. No one who had to rely for information on his article would form any notion of the progress that has been made since the second quarter of the sixteenth century, to which time belong the works of the earliest masters of sword-play of whom anything certain is known. There is a tradition given by one or two modern French authors, and repeated by the writer in *Blackwood*, that the art was brought into Italy by the Spanish armies; and there is mention in an author of the late seventeenth century of Spanish treatises as early as 1470. But these Spanish books, if they exist or have existed, are so rare as to have escaped the nets of the bibliographers. Be that as it may, for three centuries and a half at least the science of arms has been a steadily advancing one. In this matter the writer does not deal quite fairly with us. It is still stranger to call the modern French duelling-sword, as he does, the "pallid, sickly inheritor of a fallen crown." It would be almost as reasonable to describe a Martini-Henry rifle as a pallid, sickly descendant of the hand-guns of the fifteenth century. The weapon is not less pleasing to the eye than its forerunners, nor in any way inferior in metal or workmanship, and it is more nicely adapted to its purpose and capable of more scientific handling. Certainly it is less in request for serious encounters; for, on the one hand, it is not a military weapon, and on the other hand, duelling is in decadence. Not only is it fairly

extinct in this country, but it tends to become ridiculous in those where public opinion still tolerates or encourages it. And here, indeed, there is some show of derogation to the sword, far more, at least, than in its other supposed grievances. The reason that the small-sword is not a weapon of war is simply that it is too delicate an instrument for the chance medley of all arms. It can show its perfection only in a single combat on foot. But it furnishes an ideal which must be studied by those who would make the best use of other arms. It is impossible to execute any but the simplest movements of fencing with a musket and bayonet; yet a man who has learnt fencing will do much more with the bayonet than one who has not. So the greater weight of the sabre, and the necessity of parrying with the edge, limit the movements that can be effectively performed with it. Still, a knowledge of the small-sword is the best key to knowledge of what the sabre can do. Sabre-players who are not also familiar with the foil are generally too wide in their action, and hardly ever use the point. Thus it is not the proper business of the small-sword to be called in for common occasions; it is to the sabre as the match-rifle, with its elaborate sights and adjustable scales, to the coarser military weapon. Neither can the disuse of the sword in private quarrels be rightly thought any disparagement to it. For, even admitting (as we do not admit) that we have anything to regret in the practice of duelling, it is certain that the occasions which made duels are, on the whole, less frequent than they were accustomed to be; and it was never heard that a maiden assize was discreditable to the judge or his jurisdiction.

But judges may and do find it irksome, and in a manner hurtful to their dignity, though the fault be none of theirs, to be called on to try ludicrous and trifling causes. The sword may indeed be brought into contempt if it is drawn for idle and frivolous occasions and to make a holiday for gossip-mongers; and this may be seen both in public and in private affairs. Lately there has been a duel between two professors of arms in Paris, which, being spread abroad in newspapers and reported by special correspondents, goes far towards reducing to an absurdity the art and mystery of honourable quarrels that so greatly flourished in the sixteenth and seventeenth centuries. The heroes were M. Pons and Signor San Malato; the former bearing a name honoured in Parisian schools of arms through two or more generations, the latter claiming to represent to Paris the Neapolitan school of fencing, but not, as we understand, authorized or approved in that behalf by the most expert of his countrymen at Naples. The preparations were Homeric; no common blades would serve. The swords "were expressly manufactured for the fray"—a French one, of the usual fashion, for Pons; an Italian one, "after a model furnished by an Italian nobleman," for San Malato. When the forges of some unnamed Ælephasistos (the Gods of Gaul and Italy doubtless watching over his labours with rival blessings), had produced the weapons, the combatants met at a time and place of convenient publicity, and waited three-quarters of an hour before all beholders while a forgotten "regulation glove" (presumably a common fencing glove) was being sent for. We are not left ignorant of the regimen they had adopted to fortify themselves for the great event. "Signor San Malato took only a cup of coffee in the morning, eating nothing. M. Pons breakfasted as usual, and his friends say that during the combat he suffered from imperfect digestion and cramps in the stomach." Nevertheless, the tall man had the better of the fasting one, or the advantages of fasting were more than balanced by the superior excellence of the French method; for after a combat of more than an hour (the particulars of which are unhappily not recorded in the report before us), Signor San Malato got a thrust in the arm sufficient to bring the matter to an end. The champions of Italy and France embraced with mutual admiration and apologies, and the whole party, including M. Paul de Cassagnac, who had been the chief director of the proceedings, went back to Paris in much content and good fellowship. The reporter goes on to say that duels are more in vogue in Paris than ever they were. We have no reason to doubt his statement, but certainly this is not the sort of duel for which any serious or even plausible apology can be made. The one point in which it approaches to having any serious interest is that it confirms by a fresh instance what has been said by several of the best French writers on fencing, that the sword is a far more humane weapon for duellists than the pistol, at all events in competent hands. But these same writers by no means make this an excuse for the sword being lightly drawn. They all agree in treating duelling as an evil, even those who think its continuance inevitable (for some are for a system of courts of honour by which it might in their opinion be almost, or altogether, abated); they all consider a duel to be justified only by extreme and irreparable injury. The more they speak with authority on the subject, the less are they disposed to suffer any admixture of levity or vainglory in it. Indeed, they do not much differ (strange as it may seem) from the fundamental position of English opinion herein, which is that duelling is at best private war, and its continuance is a mark of imperfect civilization in the State, just as the existence of public war shows that there is not in any proper sense a commonwealth of sovereign States. Wherever violent self-help prevails, even in the comparatively mild form of the duel regulated by custom, the subjects are to that extent barbarous, or the laws grossly defective. In particular states of society the duel may conceivably be the less of present evils, as on the larger scale war may be in the affairs of nations. But such a state of things, if it exists, is not one to be acquiesced in, much less ought it to be a

matter of sentimental regret in a society where it has ceased to exist.

Our writer in *Blackwood* does not exactly commit himself to the opinion that our manners are worse for the abolition of duelling, but he seems to hold that there is something in it, and to think more than he says. All the evidence appears to us to show that when arms were habitually worn and used on slight provocation manners were not only more violent than they now are, but coarser, meaner, and worse in every way. Very moderate acquaintance with seventeenth or eighteenth century literature will show any one who doubts this that things to us incredible were thought venial, if not innocent, in a gentleman. The best that can be said for the so-called law of honour is that, as supplementing is not unimportant particulars a low standard of morality, it was better than nothing. At the same time it was in some respects positively immoral; and it is questionable whether all conventional standards of conduct limited to special cliques and classes do not by the mere fact of throwing common morality into the background produce more harm than good. In this sense, both as regards the duel, and as regards the code of honour associated with it, we take it for the better opinion that the decline of the sword has been an unmixed benefit to society. The panegyrist or mourner in *Blackwood*, we hardly know which to call him, makes one remark which is quite true, and worked out by him with just insight into human nature. It is that the relative insignificance of hand-to-hand fighting in modern warfare has wrought a revolution in military valour. The soldier of to-day does not want the muscular courage of the actively fighting animal, or rather he wants that and much more. He must endure waiting and being shot at by an enemy he cannot see; he must possess the cool nervous fortitude not to be disturbed by this—"gun-courage," as the essayist calls it. And our essayist, to do him justice, frankly admits that this kind of courage is the higher. But when he complains that in the discipline of modern armies individuality is lost, we think he is at his paradoxes again; for it is certain that the effect of long-range fire and breechloaders, and the tactical methods thereby made necessary, has been not to diminish but to increase the demand on the enterprise and individual intelligence of all ranks down to the private. The regret is another form of the old illusion about the age of chivalry. We think of the pomp and prowess of the leaders, and forget the undistinguished wretchedness of the common sort. What is highest in modern affairs does not look so lofty, because what is below is no longer so mean. The most fantastic of all our author's laments is that which he puts first. "Steel has ceased to be a gentleman," he says, because there are steel rails and steel-built ships. Perhaps the millennium, if it came upon us, would be felt as a degradation by a strictly orthodox swordsman; otherwise we do not see why steamships and girders are a more unworthy form for the noble metal to take than ploughshares or pruning-hooks.

THE MONETARY CONFERENCE.

THE proceedings of the International Monetary Conference I have already brought out very clearly the difficulties of the task undertaken by France and the United States. As these two Powers called the Conference together, it was to be expected that they should have a programme ready prepared to submit to the delegates; and it would seem, in fact, that they had; for, with the invitation sent out to the several Powers was a statement of reasons for the adoption of bimetallicism which wanted nothing in clearness and definiteness. But the statement was instantly objected to by our own Government, and, it is understood, by Germany also; so that at the very outset it seemed as if the mere proposal of bimetallicism would prevent the meeting of the Conference. The obstacle was removed. But, when at last the delegates came together, a Committee was formed to draw up a programme; and the representatives of France, the United States, and Holland each brought forward a plan. Those of the two former were again set aside, and that of the Dutch delegate was accepted. So far this does not seem very favourable to the object for which the Conference was called together. Still it must be admitted that M. Vrolik, the Dutch delegate, is a bimetallicist, and that his programme sufficiently accords with the intentions of France and the United States. It has this superiority also over the paper submitted by M. Cernuschi, that it is practical and to the point, whereas M. Cernuschi's was better adapted for a mere academic discussion. M. Vrolik proposes to discuss the causes of the oscillations in the value of silver which have occurred of late years; how far the oscillations have been injurious to commerce and the general prosperity, and how far it is desirable to establish a fixed ratio of value between the two metals. Assuming it to be desirable to establish such fixed ratio, he then proposes to discuss whether a large group of States by common agreement can give the fixity desired; and, if they can, what measures should be taken to attain to it; and, lastly, if bimetallicism is adopted, what should be the ratio between gold and silver. This, as we have said, is at least a definite and businesslike programme, which admits, too, of the full discussion of all the questions that it is necessary to raise in the Conference.

But the most important and the most significant event since the Conference met is the declaration by Baron Thielmann, the senior delegate from Germany, of the intentions of the German Government in this matter. Baron Thielmann stated that Germany,

having undergone the cost, labour, and disturbance to be involved in the reform of its monetary system, is not disposed to make any change now in that system. Besides, the commercial relations between Germany and England are so close, that the German Government thinks it desirable to maintain the same standard of value as prevails in England. But the German Government is very anxious to rehabilitate silver. Naturally it is so, for the German Government has still a large amount of silver to dispose of, and all prudent vendors desire to nurse their own market. There are various estimates of the amount of silver still in circulation in Germany, ranging from 17 millions sterling to about 25 millions sterling; and, if the existing system is to be carried out in its entirety, the greater part of this mass of metal must be sold. Naturally, therefore, the German Government, thrifty as it is, desires to rehabilitate silver, or, in other words, to get as good a price as possible for its wares. It is anxious, consequently, to encourage France and the United States, and the smaller nations represented at the Conference, to adopt bimetallicism, though by no means disposed to do so itself; and by way of inducement it makes certain offers to France and the United States. The first and the most important of these is an engagement not to sell any more silver for a number of years, to be afterwards determined between the parties. At first sight this seems a considerable point gained, but in reality it amounts to nothing. For the past two years the German Government has been compelled to suspend the sales of silver, because it found that it was losing too much by breaking down the market. If it were to begin to sell again, the price would instantly drop, and it would have once more to discontinue. It may be objected that, if the United States, France, and the other nations of the Latin Union were to resume the unlimited coinage of silver, the price would not drop again, and Germany might be able to sell her silver without material loss. But that is very doubtful, and, at any rate, it is not to be supposed that France and the other nations of the Latin Union would allow the unlimited coinage of the metal now any more than in 1875, if Germany were to begin to sell. On the contrary, the offer is vouchsafed as an inducement to them to allow unlimited coinage. Germany, moreover, does not undertake that she will never again sell silver. She will only continue the suspension of the sales for a time to be agreed upon, and after that time she will further covenant to sell barely so much as will not break down the market. In other words, with a careful eye to its own interest, the German Government will only sell as much as it will find profitable to sell, which is not a very great concession to the proposed bimetallic Union. But, furthermore, the German Government offers, if France and the United States will adopt bimetallicism, that it will call in and cancel all the 5-mark gold pieces and Treasury notes, and will issue in their stead silver coins. Baron Thielmann stated that the amount of these gold pieces and Treasury notes is about 3½ millions sterling, so that in reality this is the only concession which Germany proposes to make to France and the United States. If they will open their mints to the unlimited coinage of silver, she will increase her own coinage of it by 3½ millions sterling, which will still leave from 14 to 21 millions sterling of the metal to be sold, assuming that the usual estimates are correct. According to the Census just taken, it seems that about 1½ million sterling of silver in the form of additional subsidiary coins will have to be issued, and this will bring down the amount to be sold, supposing the offer made at the Conference to be accepted, to from 12 to 19 millions sterling. Of this latter amount, as we have said, Germany undertakes to sell none for a definite number of years, and to sell only so much as will be found not to flood the market in subsequent years. But still the proposed bimetallic Union will have to reckon with the resumption of sales. In other words, the German silver will continue to hang over the markets.

Furthermore, Germany will agree to the prohibition by the proposed Union of the acceptance by their mints of thalers for re-coinage. That is to say, if German silver is to be sent to France, the United States, or their monetary allies for coinage, that silver must first be melted down, which will no doubt add a little to the cost—or, to put it in another way, subtract a little from the profits of the holders of the silver—but certainly will not prevent the exportation of silver which is not needed in Germany to the bimetallic countries. We cannot wonder, then, that this proposal of Germany should be regarded in the Conference as unsatisfactory, and it would seem to be fatal to the objects for which the Conference was called together. France, the United States, and their monetary allies might have adopted bimetallicism without the calling together of a conference, if they had chosen. As they were unwilling to do so, we must suppose that they thought it necessary to get the adhesion of England and Germany. But England, from the first, stated that she would not change her monetary system, and Germany has now said as much. With regard to England, indeed, the representative of India declared that the Indian Government would be most willing to rehabilitate silver, which, we believe, means that the Indian Government would give any pledge required that no change should be made in the Indian monetary system. But, as it was certain beforehand that no change is intended, or can be afforded, by India, that too, is of as little value as the offer made by Germany. In short, France and the United States have to face the fact, which they ought to have understood beforehand, that neither England nor Germany will adopt bimetallicism. It remains to be seen whether France and the United States, having fully realised this, will now adopt bimetallicism themselves. So far as the United States are con-

owned we see no sufficient reason for doing so. As a great producer of silver, no doubt, the United States have an interest in keeping up the price of the metal. But, after all, the silver produced is small compared with many other articles exported. And it may be doubted, therefore, whether the American people will consent to the free coinage of silver, since the restricted amount now coined cannot be got into circulation. France, on the other hand, has an interest in returning to the free coinage of silver. She has allowed so much of her gold to be drained away, that it will cost her much to recover it, while such a mass of silver hoards in the vaults of the Bank of France, that it would be very costly indeed to demonetize that metal. Still, France will not like to give up gold, and as the Bank of France is preparing to issue 50- and 20-franc notes, it is clear that every effort will be made to maintain the existing state of things.

The most dubious incident of the Conference, and the least encouraging for the bimetallicists, is the proposal made by M. Cernuschi that the countries which have profited by buying silver cheap should reimburse Germany for her losses in the sale of the metal, on the condition that Germany adopts bimetallicism. The proposal is so utterly impracticable, that one can only wonder how it could be put forward by a person occupying the position of representative of France at an international Conference. M. Cernuschi must have little hope that his pet panacea will be adopted when he makes such a suggestion, and he must have little knowledge of men or affairs to suppose that the suggestion would for a moment be listened to. He actually moved, however, for statistics of the purchases and sales of gold and silver since 1874, for the purpose of showing the profit made and the loss suffered by each country in the interval, these statistics to serve as the basis for the assessment of the contributions to be made by the several countries in relief of Germany. The proposal was referred to the several Governments, and we may assume that no more will be heard of it. It has, however, very seriously discouraged the bimetallicists in this country, who feel their cause compromised and made ridiculous by a proposal so injudicious and so impracticable.

Probably the incident will do more to open the eyes of those who have been led away by the bimetallicist agitation than any amount of calm reasoning. M. Cernuschi has been the soul of the agitation; and, when he convicts himself of such egregious want of judgment, he gives cause to his followers to reconsider their opinions. The incident, too, serves to show how far an enthusiast can be carried away by his hobby. He actually appears to have persuaded himself that it is worth the while, not alone of rich countries like England, France, and the United States, but also of a country like India, with a vast population always on the verge of famine, to buy the consent of Germany to bimetallicism.

THE OPERAS.

THIS year the opera season has begun much later than usual, and, to judge by the prospectuses of the two houses, most interest will be felt in the doings at Covent Garden. Not only is Mr. Mapleson much later in opening his theatre than Mr. Gye, but his programme is almost timid in its modesty. He does not propose to produce any new work, being apparently content with the success of Boito's *Mefistophelo* produced last season. He also has had the great misfortune to lose the services of Mme. Trebelli, who has gone to the other house. Mr. Mapleson's loss may turn out to be the public's gain, for already there are indications of a friendly artistic rivalry between this great artist and Mme. Scatchi, both singers having already surpassed themselves in familiar parts. Mr. Gye is more ambitious. In addition to a fair number of new singers, many of whom already have considerable reputation in other countries, he proposes to perform a few works new in England, amongst them Rubinstein's *Demonio*. Signor Vianesi is no longer conductor; but the valuable services of Signor Bevnigani have been retained; and, as the management of Covent Garden find some advantage in the system of two conductors to overbalance its well-known disadvantages, he divides the work with M. Dupont, the celebrated conductor of the Théâtre de la Monnaie at Brussels. The earlier performances at Her Majesty's we propose to notice later in the season.

Mr. Gye, as usual, has made all haste in bringing his new singers before the public. The first night of the season Mlle. de Reszkó, a "dramatic soprano," and M. Vergnet, a tenor, appeared as *Aida* and *Rhadames* in Verdi's last opera. Mlle. de Reszkó, though undoubtedly a good singer, we fear will not satisfy the English public in the position which she seeks to hold. She has a powerful voice; but gives the impression of a low mezzo-soprano who has imprudently forced her voice up so as to become a soprano, instead of cultivating the lower register, and so fitting her for contralto music. Of her acting it is difficult to judge; for *Aida* is a part in which a very fine actress might make a great effect, but if it be played by any one not possessing the highest powers, it sinks to insignificance. Illness has prevented Mlle. de Reszkó from appearing since, so that we should reserve our judgment as to her dramatic powers until we have seen her in some part not so entirely beyond the grasp of even an ordinarily good actress.

M. Vergnet has a pleasant voice, and sings well, though his vocalism is spoiled by the usual tremolo; he is not without dramatic musical feeling, but generally mistakes sentimentality for tenderness. He is obviously accustomed to being on the stage; but we cannot give him any higher praise as an actor. The rest

of the cast calls for no special notice. Musically, the whole performance was excellent, both band and chorus showing traces of rehearsal, whilst Signor Bevnigani's great power of command filled up all details. We regretted to notice, however, that he has not had the courage to abandon the traditional violent *accelerando* at the end of the march, which to our mind is as inartistic as Signor Tagliafico's magical scenic effect in the first act of *Faust*.

A few nights later *Guglielmo Tell* was revived for the debut of Signor Mierswinsky in the part of Arnaldo. He has a voice of extraordinary power and volume, with far more of the true tenor quality than is usually to be found in robust tenors. Unfortunately—perhaps misled by the great size of Covent Garden Theatre—he persistently forced his voice, and thus spoilt its quality. He is a very good vocalist, and can sing entirely without the terrible tremolo, his sustained notes being as steady as those of a wind instrument. He has but one serious defect as a singer; in almost all impassioned passages each breath is marked by an audible sob; he has obviously devoted much careful study to the art of acting, but as the dramatic feeling which he shows in his singing does not come to his help in his acting, the effect of his well-executed, graceful, but utterly meaningless gestures is more grotesque than impressive; however, such a voice and such good singing are likely to make him a favourite with the public.

M. Dupont conducted, and showed at once that we had gained a conductor, and not a mere time-beater. He is very undemonstrative, but on this occasion had a perfect command of his band and chorus, while his reading of the music was intelligent and artistic. Above all, he understands the art of accompanying the voices, for which this first and only specimen of Rossini's latest operatic style is a very good test; for here the composer has broken away from the traditions of the contemporary Italian school, and has entirely discarded the "big guitar." M. Dupont hit the happy mean, and gave due importance to the orchestral parts, but always allowed the voices to dominate. The general cast of the opera hardly calls for notice, but we may mention that Mlle. Velmi, who sang Jenny, though evidently nearly paralysed by nervousness, showed such great signs of promise that we shall watch her career with much interest. The band of men dancers and pantomimists who have been introduced in this theatre did their best to save the crowded scenes from the effects of the so-called stage management, and two of them showed real genius in the way in which they "loaded Tell with chains," and afterwards induced the audience to believe that Tell was struggling violently with them, in spite of the fact that Signor Cotogni, who played the part, never moved or did anything.

The next new singer whom we have to mention is Signor Sante Athos, who made his first appearance as Rigoletto. He had the advantage of playing with Mme. Albani, whose Gilda was, if possible, more excellent than in former seasons; whilst her voice, which was in excellent order, seems to have gained in roundness and sympathy of quality. Signor Sante Athos has a fine voice, sings well, and is an actor; but his performance was one very trying to a critic. We should be inclined to say that the part has seldom been so well acted, and that probably no singer ever so completely failed to make any effect in the stronger situations. Why this should have been so almost defies analysis and explanation. *Faust* was given for Mme. Trebelli's first appearance at Covent Garden this season; and of course there was a full house to hear the wonderful music of this great and poetic work, which we in England have so taken to our hearts that, were an English writer to venture to treat it in the spirit of a recent writer in the *Revue des Deux Mondes* who speaks of the score as a *partition telle quelle*, he would raise a storm of indignation from the whole music-loving world. To begin with, we may say that M. Vergnet sang *Faust*, and, as the music gave him more opportunities for showing his tendency to weak sentimentality, his performance was even less pleasing than his former one. Mme. Albani was Marguerite. The interest of the evening, however, was in Mme. Trebelli's performance, and never, perhaps, has the music been sung as she then sang it, even by herself. M. Dupont tried hard to make a good general performance; but both band and chorus were coarse and deficient in sharpness of attack. The third act was performed as written—the chamber scene being restored, the cathedral scene following played outside the cathedral; the act ending with the death of Valentine, in which Signor Sante Athos made a great effect, after having played the whole part thoroughly well. This sacrificing of a mechanical effect to the dramatic interest of the opera is a good sign, and may perhaps be the first step towards abolishing the effect in the first act, which always makes us think that we are in a country town hall, seeing the performance of some travelling troupe of "Ghost Illusionists."

Les Huguenots, after having been announced and withdrawn in consequence of Mlle. de Reszkó's illness, was given on Monday night, Mme. Fursch-Madier singing Valentine instead of Mlle. de Reszkó, who was still unable to appear. Mme. Fursch-Madier showed herself to be a dramatic soprano of far higher abilities than most of the artists who have come to England to try to fill up the place left vacant by the loss of Mme. Tietjens. Mme. Sembrich made a great success as Margherita di Valois, not only showing her great vocal skill, but playing the part well. Signor Mierswinsky sang Raoul, and though he did not force his voice as much as he did in Arnaldo, the sobbing breathing was as strongly marked as before. M. Gresse, a newcomer, sang Marcello, but, in our opinion, did not differ much from others whom we have heard in the part before. The performance under Signor Bevnigani was extremely good.

Mr. Sims Reeves's farewell concert in oratorio began on the 4th inst. with a performance of *Judas Maccabæus*. It must be as great a source of gratification to the gifted artist to see the crowded audiences which always greet him when he is announced to sing, as it is a proof of the just appreciation that the English public have of the merits of so distinguished a singer. It was with no little regret, although the circumstance might well have been looked for after the east winds which prevailed during the end of last month and the beginning of this, that the audience learned that Mr. Sims Reeves was suffering from a sore throat. In spite of this, however, he appeared, and was greeted with such applause as he alone can command. The cast was exceptionally strong, including, as it did, not only the great tenor, but such artists as Mme. Christine Nilsson, Mme. Trebelli, and Mr. Santley, with the co-operation of Miss Annie Sinclair, Miss Hoare, and Mr. T. Hanson. Written in 1746, it is said in commemoration of the Duke of Cumberland's victory at Culloden, *Judas Maccabæus* in its entirety is not so often heard as some of Handel's other masterpieces, although the work contains some of the master's most vigorous writing. Mme. Nilsson's rendering of "Pious orgies," "O Liberty," and "From mighty kings" was superb; and Mr. Santley's "Arm, arm, ye brave!" and "The Lord worketh wonders," were given with the full resources of Mr. Santley's art; whilst "Call forth Thy powers," which, with the accompanied recitative, "So will'd my father," and the short "Haste we, brethren," were the only numbers he took part in. Mr. Sims Reeves showed that he still retained all the artistic power that has made him so famous, and that the great disadvantage of indisposition under which he laboured, notwithstanding, he was still *facile princeps* among English tenors.

At the second concert at the Albert Hall, which included the first and second parts of Haydn's *Creation* and Mendelssohn's *Lobgesang*, Mr. Sims Reeves was unfortunately unable to attend, owing to his being confined to his room with neuralgia. It is unnecessary to say that the disappointment to the public was great; and we venture to suggest that, should Mr. Sims Reeves be indisposed by the time of the next concert, the managers might give notice of the fact a little sooner, and thereby give those whose desire it was to hear the great artist some chance of postponing their visit. To take your seat at the concert, and find a civil notice that the principal artist is not going to sing, is not at any time calculated to put you in a good humour, whilst a notice in the papers twelve hours before would at least have prepared you for disappointment. With such artists, however, as Mme. Albani, Miss Anna Williams, and Messrs. Lloyd and Santley, the concert could not but be a success, and this was further assured by the admirable singing of the choir and playing of the orchestra under Mr. Barnby.

The first Richter Concert took place on Monday last. We have before pointed out the extraordinary excellence of Herr Richter's powers as a conductor, and can only reiterate our opinion that as yet we have never seen one who has so complete a mastery over his orchestra, and so remarkable a faculty of interpreting the works of the composers with whom he deals as he has. The programme included Wagner's "Huldigungs Marsch," which, although we have heard it several times before, never struck us as much as on this occasion; a Concerto by Bach in E Minor; the overture to *Oberon*, by Weber; and, as the second part, Beethoven's Ninth Symphony. The Bach Concerto has a history, according to the author of the analytical programme. The autograph copy of an unknown Sonata, by Bach, was discovered in Dresden and was sent to Herr Joseph Hellmesberger, of Vienna, who added a five-part accompaniment for strings, in which form it was played on Monday. After a very characteristic Allegro in *moto perpetuo*, which is played *fortissimo* throughout, follows a most lovely Adagio in Bach's happiest style; and the Concerto, if it may so be called, ends with a Gigue full of the most stately vivacity, if one may coin a term. The excellence of the training of the orchestra was especially noticeable in the performance of this work from the admirable expressions of light and shade with which it overflowed. The Ninth Symphony—the performance of which last year created such an impression—it is sufficient to say was rendered, if possible, in a finer manner than at that time.

OTHELLO AT THE LYCEUM.

A DOUBLE, or more than a double, interest attached to the representations given at the Lyceum this week with Mr. Irving as the Moor and Mr. Edwin Booth as the Ancient. Besides the natural curiosity to see the two great actors exchanging parts, and to see Mr. Booth's Iago in more favourable circumstances than had before been possible, there was as a matter of course much eagerness to see what change five years had worked in Mr. Irving's treatment of the part of Othello. It is needless to recall in detail certain faults which were apparent in the actor's first undertaking of the character, but it is well to say that the difference between the two performances may have fairly astonished even those who were best aware of the amount of study given to the second attempt. Indeed, the present performance of *Othello* marks more clearly than anything else could well do the amount of thought and pains which Mr. Irving must constantly devote to his art. Among the many commentators on the much-discussed character

of Othello, not the least instructed or qualified was the great Dumas, the father, not the son; and as Mr. Irving's idea of the character answers somewhat closely to a good deal of what Dumas wrote, it may be worth while to quote it:—"Pour moi, ce qui domine dans la splendide création du More, c'est le calme et la force répandus sur tout le personnage. Quand il est calme et se repose c'est à la manière du lion: *A guisa di leon, quando si posa, comme dit Dante.*" Then he goes on to dwell upon the dignity and self-restraint of "Keep up your bright swords," and of the following speech to Brabantio, and says, "Vous le voyez: il est difficile d'être plus doux et plus fort en même temps." Again, of the following passage:—"What if I do obey?" &c., he remarks, with equal truth, "Vous le voyez, toujours la même sérénité, à part cette légère ironie qui crispe la lèvre du More." Thus far Mr. Irving's interpretation coincides as nearly as possible with Dumas's observations. What Dumas, while dwelling upon the *calme*, the *douceur*, the *sérénité* of the speech to the Senate did not take into account was the fine effect which Mr. Irving introduces into the end of this well-known address when he gradually departs from the somewhat formal dignity and reticence of the opening, not into loudness or violence, but into a poetical exaltation caused by the memories of his courtship which he is recounting. There is nothing in it the least unbecoming either his own dignity or that of the august personages he addresses; it is a natural and noble forgetfulness of the moment which seems to fit the noble, loving nature of the Moorish general. The delivery of the last lines of the speech by Mr. Irving threw a light upon the expectations and attitude of his audience in front, which led us to think that we might have done a slight injustice to Mr. Booth's rendering of the same passage. So far as it was possible to judge, Mr. Irving did not seem anxious to make a "point" at "I loved her that she did pity them," but the applause which instantly followed the words obliged him to pause between this and the line "This only is the witchcraft I have used," which he gave with just the "légère ironie" which it seems to us to demand.

Thus far Mr. Irving's Othello is strongly marked by the restraint, the sense of respect for himself and for others, and the "gustos sobres et sévères" of which Dumas speaks later. He employs a stillness of pose which is perhaps more remarkable in him than it might be in some other actors; but the emotions which he feels are shown by the varying, but never exaggerated, expressions which flit across his face. His gestures are significant, but few and quiet. His entry in the Cyprus scene is dignified and impressive; and here, as in former scenes, his tenderness to Desdemona is exquisite, but entirely free from the over-accusation, to give it the mildest name, of passion which has before now been introduced into the part. Here, again, he is in consonance with Dumas's idea, which has always been, in this regard, our own. After his tempest-tossed voyage, "voyons si sa lutte contre les flots l'a plus ému que sa lutte contre les hommes. . . . Aussi, quelle est la première parole de colère que laisse échapper Othello?" It is when he is aroused from his sleep by the night-brawl, "et encore cette colère, en parle-t-il plus qu'il ne la montre." Here Mr. Irving made, as we think, his first mistake. It seems to us that he would gain much effect by preserving the same stillness of command which has hitherto belonged to him, instead of striding about the stage in an agitation which no doubt may be natural, but which might equally naturally be suppressed. The rebuke to Cassio is, however, delivered with much dignity, and with just the suggestion of grief which befits the occasion and the man. Before this the actor has introduced a fine touch in his quiet gesture of surprise and sorrow at Cassio's "I cannot speak," when he seems for the first time to suspect and realize what is the real cause of the disturbance. He might perhaps restore with advantage the entrance of Desdemona, and the words from Othello which follow it. It is naturally, however, Mr. Irving's performance in the following act that is most impatiently watched for. In the beginning of this his conception of the Moor as one "not easily jealous" is strongly and finely marked. "Was not that Cassio?" is asked as a question casually uttered by a man who is at the moment absorbed in affairs of State; and "I do believe 'twas he" is merely a half-playful and half-absent contradiction of Iago's answer, the sting of which has left him completely untouched. At "He echoes me, as if there were some monster in his thought," the Moor seems waked to a vague suspicion of something being wrong, not with his own affairs so much as with Iago's state of mind. His attention is aroused sufficiently to divert itself from the papers which he has been studying, but as yet he is far from the apprehension of that which Iago desires him to apprehend. As the speech goes on, and he runs over the previous replies of the Ancient, the words seem gradually to assume to him, as he repeats them, something, but by no means all, of the meaning with which Iago has charged them. He has a dim sense of disquietude, which craves full explanation; his serene abstraction is disturbed somehow, he knows not, or will not reflect, how. He is like a man beset by phantom forms, behind which there lurks some grim reality which he must, and will, master. In this sense of growing and half-defined unrest the scene is played until at "By heaven, I'll know thy thoughts," the noble nature and trust of the Moor is, not indeed yet shaken, but aroused to a sense of some special ill known or suspected by the Ancient. Still in the magnificent speech ending with "Away at once with love, or jealousy," there is no absolute outward sign that the Moor is as yet applying general principles to

his particular case. There is enough indication, however, of the blow having told to embolden Iago to make his next speech—one of the most diabolical which occur in the character, and after the reference to Desdemona's deceiving her father, and the lines "And when she seem'd to shake and fear your looks, she loved them most," it becomes evident from the actor's face and voice, rather than from any movement, that the poison has actually begun to work. The "Not a jot, not a jot," and "No, not much mov'd," were given with the same sense of restraint, and the same suggestion of the first unhooking of a noble nature. The following soliloquy and scene with Desdemona are charged with thought and growing passion, and the great scene with Iago afterwards is played with a combined force and restraint which are excellent. The phrasing is sometimes unfortunate, as when Mr. Irving, at "nothing canst thou to damnation add," takes breath after the first syllable of "damnation," but the passion is finely conceived and finely executed. We greatly prefer the dagger business employed by some other actors—among them Mr. Booth—to Mr. Irving's method of actually throwing Iago down; but to go into all the reasons for and against this would involve the writing of an elaborate treatise on various views which have been or may be taken of the two characters. The "Farewell" speech before this was given with a fine sense of repose and great-hearted sorrow, and the actor's voice seems now capable of taking tones of depth and impressiveness which before he could not compass. In what follows there is one specially fine touch. The difficult and dreadful stillness which Othello preserves, while listening to Iago's account of Cassio's dream, is broken at one point only by a convulsive shudder which runs through the general's frame. In the scene of the following act with Desdemona there is a deeply pathetic contest between the Moor's tender love for Desdemona and his conviction that she has injured him beyond repair in his tenderest point—his honour; and in the scene with Ludovico the passion which has reached a point where it cannot be completely hid from bystanders is yet evidently restrained from finding full vent by the half-obscured chivalry of the general's nature. It may be noted that the words "Cassio shall have my place" are spoken not to Ludovico, but to Desdemona as she goes out weeping and terrified. The last scene is conceived in the spirit to which, to our thinking, every line points, of the killing of Desdemona being a just and necessary execution, not a murder inspired by revenge alone. There is something appalling in the actor's aspect as he stands immovable, and himself appalled at the deed, by the bed on which the seemingly lifeless Desdemona lies. At one point only, just before the deed is done, is there any touch of violence, and this might, we think, be omitted with very great advantage. Mr. Irving's acting as he gradually learns how he has been practised upon was completely in consonance with the fine conception which had gone before, and his death had a combined grandeur and tenderness. It is interesting to note from Dumas how, in the infliction of the suicidal wound, "Talma se frappait de haut en bas; Joanny suivait la tradition de Talma; Kean et Kemble s'enfonçaient horizontalement et à deux mains le poignard dans le cœur. Macready se l'enfonçait au-dessous des côtes, et de bas en haut."

The brilliancy of Mr. Booth's performance in Iago, of which we have on a former occasion expressed our admiration, seems, as might be expected, increased by the great improvement in its setting. In some respects his interpretation of the part corresponds with that of the elder Kean as described by Hazlitt. "The ease, familiarity, and tone of nature with which the text was delivered were quite equal to anything we have seen in the best comic acting. . . . The odiousness of the character was, in fact, in some measure glossed over by the extreme grace, alacrity, and rapidity of the execution." Mr. Booth's Iago is not, however, open to the objection which Hazlitt made to Kean's, that of wanting devilishness at times which might be thought appropriate. We do not by any means agree altogether with Hazlitt in his estimate of the part; but he was, perhaps, right in thinking that the diabolical side of Iago's character should be shown on occasion. In this respect Mr. Booth's Iago could hardly have disappointed him. He is, when left alone, more than a devil, and his double, or more than double, character is at once indicated by the sudden change of manner in the Senate scene after Roderigo has left him. No sooner is the silly gentleman out of sight than the accomplished soldier of fortune becomes the dark schemer who beats about his brain to compass the overthrow of those he envies even more than to seek his own advancement. The complete command and skill of attitude and gesture, which sometimes remind one of M. Faure, were even more observable than before. It is, however, needless to repeat in detail our admiration of a performance of which we have already written at length, and which gains, as we have said, by its new associations. For the rest, the dash and knightliness of Mr. Terriss's Cassio, the tender grace of Miss Terry's Desdemona, and, to omit other praiseworthy performances, the gawky but well-bred Roderigo presented by Mr. Pinero, have all improved by iteration. With both casts the representation of *Othello* at the Lyceum is a perhaps unprecedented presentation of a play which the critic of *Punch* considers intolerable to a "nineteenth-century audience," thereby meaning obviously enough himself.

REVIEWS.

HELMHOLTZ'S POPULAR SCIENCE LECTURES.*

THE second series of popular lectures upon scientific subjects, by Professor Helmholtz, lately made accessible to English readers in their own language, will be found not less worthy of public favour than the selection which preceded them. The mastery of nature possessed by the great German physicist enables him to give to the theories or discoveries of science that distinctness and clearness of expression which forms the first requisite for a popular instructor. In his exposition of the facts or mysteries of nature he is careful to use the simplest language, avoiding as far as may be technical or unfamiliar words, in which wholesome habit he has been faithfully seconded in the course of the translation before us, which has the directness and the easy flow of original writing. The half-dozen lectures here brought together from the Professor's academic courses at Cologne, Berlin, Bonn, and elsewhere, range over a wide field of matter, and open up vistas of thought which the more earnest class of students will feel impelled, by the example and the enthusiasm of the lecturer, to follow up for themselves.

The series opens with an address in memory of the distinguished physicist Gustav Magnus, who for thirty years occupied the chair at the University of Berlin now held by his pupil Professor Helmholtz. Originally trained to business, Professor Magnus brought to the pursuit of natural science the love and habit of order, the faculty of organization, and the tendency towards what is real, tangible, and practical, acquired in a well-regulated commercial house. A master of faithful, patient, modest work, he won the admiration of his pupils by the unflinching success and ease of his experiments, with which the flow of his discourse ran on in a harmony that had no break. The instruments and other apparatus constructed or collected by him and left as a legacy to the University were models of accuracy and elegance, kept in the most absolute order, a glass tube, a silk thread, a cork, or what not, ever at hand for the experiment. To realize what he effected in science a glance needs to be thrown back to the early years of the current century. In Germany, if not elsewhere, ideas akin to the alchemy of the middle ages still prevailed. Of the revolutionizing discoveries of Lavoisier and Davy not much had got into the school-books. Although oxygen was already known, yet phlogiston, the fire element, played also its part. Chlorine was still oxygenated hydrochloric acid, potash and lime were still elements. Invertebrate animals were divided into insects and reptiles; and in botany, as Professor Helmholtz rounds off his rapid sketch, "we still counted stamens." Absorbed after the reformation by theology, next in turn by metaphysical and ethical speculation, and later by the romantic and poetic revival, the German mind at length turned back to the study of natural science, which had its earlier development under the auspices of Copernicus, Kepler, Leibnitz, and Stahl. At Berlin, the stronghold of speculation, Magnus was foremost in preaching to his pupils the belief in observation and experiment as the foundations of the knowledge of nature. Though some have complained of his having been carried too far in this reaction, unduly diverting the flood of mathematical physics which had taken a new and valuable direction under the hands of Gauss, F. E. Neumann, and their pupils, Professor Helmholtz establishes for his master a thorough balance of method between mathematical and experimental physics. It was especially, he urges, on problems adapted to analytical treatment that Magnus worked with success, and whilst he followed Faraday's lead in the field of experimentation, he was eager to recognize the utmost advances made by Kirchhoff, Stokes, Thomson, and Clerk Maxwell from the standpoint of mathematical theory. The task of science was with him to find the laws of facts, avoiding on the one hand the theorist who holds it unnecessary to prove experimentally the hypothetical results which to him seem axioms, and, on the other, the empiricist who sets out to discover facts which fit no rule, careless of their connexion with other facts or physical laws in general. Beginning as a chemist, Magnus became ultimately a physicist in the widest sense. His researches are not only numerous, but extend over wider regions than could now be traversed by any single inquirer. In his life of nearly seventy years, closing in 1870, he beheld, and was foremost in effecting, the entire renovation of the edifice of science. In his researches into the gases of the blood he dealt a blow at the heart of vitalistic theories. Laying a scientific foundation for a correct theory of respiration, he led physics to the centre of organic change, from which has been developed one of the most important chapters of physiology. Where next to nothing was known of atoms, or of the extraordinary influence which heat has upon molecules, and heat itself was regarded as imponderable matter, he succeeded by his investigations of the thermo-electric pile in arriving at a solution prophetic of Sir W. Thomson's later discoveries of the laws of the conductivity of heat. Other admirable examples of this true method of physical investigation and reasoning are instanced by his biographer, in his researches on the efflux of jets of water, and the deviation of rifled shot due to the resistance of the air.

In his lecture to the *Dozenten Verein* at Heidelberg, ten years ago, Professor Helmholtz speaks of the origin and significance of

* *Popular Lectures on Scientific Subjects.* By H. Helmholtz, Professor of Physics in the University of Berlin. Translated by E. Atkinson, Ph.D., F.C.S., &c. Second Series. London: Longmans & Co. 1881.

geometrical axioms in terms suitable to those whose mathematical studies had for the most part been limited to the ordinary instruction given in schools. He seeks to compress into ordinary terms the main results arrived at in the course of development of recent geometrical analysis, and their relation to experience. The researches in question being more immediately designed for the satisfaction of experts in a region which more almost than any other calls for higher power of abstraction, being virtually inaccessible to the non-mathematician, the lecturer does what he can for such a hearer. It will be allowed that no one could have made the exposition clearer. Any one who has entered the gates of geometrical science—that is, the elements of the mathematical doctrine of space—finds certain principles laid down which geometry confesses herself unable to prove, but of which it must be said that every one who grasps their meaning at once grants their correctness. If intuitively true, inherited from the divine source of our reason, as idealistic philosophers think, they are not the less verified by such actual standards as are supplied by experience or by geometrical construction. Drawn out as reasoned conclusions from these primary propositions, the general body of geometrical science identified with the scheme of Euclid was felt to satisfy the requirements of practice, and to be suited to the condition in which we find ourselves in space. It was when the linear method in geometrical calculation and measurement was by degrees supplanted by the algebraical, that conditions were introduced to which the received understanding of space supplied no parallel or attached no meaning. To meet the requirements of formulas rising above three degrees, conceptions must be called up of space beyond the three dimensions which exhausted the powers of experience and bounded the constructions of Euclid. To the axioms which to Kant seemed to express *a priori* or of necessity the conditions of intuition by the senses—for instance, that space has three dimensions—was superadded under the extensions of Lobatchewsky, Riemann, Beltrami, and others of the new school, the sphere of hyperspatial geometry. In spherical or pseudo-spherical space was opened up a realm of boundless advance for the speculative intellect. Had we but organs of sense and perception fitted to these new conditions, we might give shape and reality to such visions, to which our present experience offers no analogy. “As all our means of sense-perception extend only to space of three dimensions, and a fourth is not merely a modification of what we have, but something entirely new, we find ourselves by reason of our bodily organization quite unable to represent a fourth dimension.”

A travesty of hyperspatial or transcendental geometry has been lately seen in the attempt to account for certain so-called spiritist phenomena, such as tying a knot in a closed or endless string, by the assumption that the spirits act in space of four dimensions, in which such an operation is possible. The notion of physical action of this or any kind passing from the one sphere to the other is simply ridiculous. If in the sphere of higher dimensions there are to be seen perpendiculars “more than plumb,” we must not expect to see them realized in the buildings of our matter-of-fact world. The sphere in which we live and to which our organs are adjusted is an aggregate of three dimensions, requiring and admitting measurement in as many directions and no more; in the case of the earth, for example, longitude, latitude, and height above the sea, or, as is usual in analytical geometry, the distances from three co-ordinate planes. Within or beyond this sphere such space relations as the line (single space), the plane (twofold space), or the hypothetical fourfold or plural space, the mind deals with what may be called either abstractions of its own or conceptions for which our sense organs supply no real equivalent. For more ample particulars of the relation of the axioms of geometry to real things, the reader had better consult at length Professor Helmholtz's lucid pages.

In treating the relation of optics to painting, our author begins with an apology for approaching a subject on which his hearers may have had more frequent opportunities of artistic as well as historical study; lacking, moreover, as he does, all experience in the actual practice of art. It is, he pleads, by a path which is but little trodden that he has come to his artistic studies—namely, by the physiology of the senses. The manner in which the perceptions of our senses originate, how impressions from without pass into our nerves, and how the condition of the latter is thereby altered, presents many points of contact with the theory of the fine arts. In an earlier series of lectures he had sought to establish such a relation between the physiology of the sense of hearing and the theory of music. With no intention of furnishing instructions according to which the artist is to work, æsthetic lectures of this kind seeming to him an utter mistake in practice, he addresses himself more directly to the laws of the perceptions, and of the observations of sense in relation to what the artist seeks to portray, together with the elementary means with which he works towards his object. His inquiry naturally falls under a few primary heads. The first of these is form. The painter who aims at producing an image of external objects must first determine what degree or what kind of similarity he can expect to attain, and what limits are assigned him by the nature of his method. The uneducated observer usually requires little more than illusive resemblance to nature. One whose taste has been more finely educated will consciously or unconsciously require something more than a mere crude copy of nature. He must have artistic selection, grouping, sentiment, with some degree of idealization of the object represented. In the calculation of depth and distance, which he has to project upon a plane surface, he must first study the laws of perspective, linear and aerial, together with the optical effects due to local or

incidental disturbance or refraction in the atmospheric medium. Secondly, he has to consider the effects of shade; of the requisite truth to nature of a picture how much depends upon the disposition between brightness and darkness, the quantitative relations between luminous intensities. Some curious experiments enable our author to assign limits to the power that artists may wield over the representation of brightness. A coating of lamp-black or a black velvet surface was found to have about one-hundredth part of the brightness of white paper. A painter's brightest colours are thus only some hundred times as bright as his darkest shades. Another important element to be considered is the varying extent to which our senses are deadened by light, an effect comparable to that of fatigue in muscle. The degree of illumination to be given to the whole or part of a picture will be determined, not only by the strength given to the brighter or darker pigments, but by the force of light, direct or refracted, thrown upon the picture in the studio or the exhibition room. For artistic effectiveness the chief emphasis is to be laid on imitating differences of brightness, and not absolute brightness; expression lying in the due gradation of shade. On colour, as the next element in the problem, Helmholtz brings to bear his exceptional command of the phenomena of light, proceeding to harmony of colour, with special reference to the conditions under which the painter has to work and his labour has to be seen, be his medium canvas or fresco, his pigments oil or water, his picture to meet direct sunlight, as on an external wall, or the softened light of a gallery, church, or room. The study of the spectrum is brought in to determine the combinations and contrasts of colour which are permissible or pleasing, and within the short space at command there is given an admirable epitome of the rules which the painter will find best calculated to secure the equilibrium and harmony of his scheme of colour.

Want of space forbids, to our great regret, our doing more than indicate the subjects of the remaining lectures, in one of which the author discusses, by the light of the most recent investigations, the hypotheses of Kant and Laplace as to the origin of the planetary system, and in the second, delivered as an address on the anniversary of the foundation of the Institute for the Education of Army Surgeons, he gives some admirable suggestions upon the functions and value of thought in medicine, the principles of scientific method being inculcated in combination with the teachings of experience, the work of his master, Johannes Müller, being held up as the most typical exemplification at once of the philosophical and the practical spirit. In his rectorial address on Academic Freedom in German Universities, with which the series closes, he institutes a highly instructive comparison between the University systems of his native land and those of other European countries, the value of which has been much enhanced by the author's permission to modify in the translation certain passages in the original discourse, which had reference to a state of things in the Universities of England greatly altered by subsequent reforms. If for liberty of thought and expression the pre-eminence is to be claimed for the Fatherland, he does ample justice to the freedom and width of training which keep the intellect of Great Britain from overpressure of the academic yoke.

AN UNLESSONED GIRL.*

IN no way can a novelist more easily show his wisdom than by putting his reader to as little trouble as possible in making the acquaintance both of him and of his heroes. If we are to go through any labour in reading a story, at all events no kind of effort should be required of us till our interest has been aroused. When once our curiosity is excited, and we are really anxious to trace the fortunes of some unfortunate hero or some heart-broken heroine, then, perhaps, we can with patience bear the details of a complicated genealogy, an ill-drawn will, or a mysterious lawsuit. But to expect that we shall burden our memory with an account of the various branches of a family which as yet interests us no more than the ancient dynasties of Egypt, is surely not a little unreasonable. We can assure our novelists that, so far as their critics are concerned, they act most foolishly in making their opening chapters a burden and a toil. Some of them are aware of this, and try to give a few pages of lively description, to be followed however, long before any interest has been awakened, by the usual tedious family history. These, perhaps, excite our anger even more than those who at once overwhelm us with all their tediousness. They have, we feel, tricked us, and a trick we cannot readily forgive. Had they waited till we were well on in the second volume, and till the hero and heroine were equally well on in the road to despair, then they might, with some confidence, have broken the thread of their narrative and invited the attention of their readers to the study of a complicated problem, by which alone a chance of deliverance was offered. Even then the reader who has been jaded by a long course of novel-reading may refuse to make the necessary effort, and may either throw down the book never to take it up again, or may skip the explanatory chapter, and make out the rest of the story as best he can. For this latter method there is a good deal to be said; for, if in no other respect, yet in this one does a

* *An Unlessoned Girl*. By Mrs Herbert Martin. 2 vols. London and Belfast: Marcus Ward & Co. 1881.

novel resemble a sermon, that for its full enjoyment there is no need that it should be understood.

Into such a course of reflection have we been led by the story before us. It is not a book that has any great merits, while, on the contrary, it has one or two serious faults. Nevertheless, as we laid it down we found, somewhat to our surprise, that, on the whole, we had read it without any serious discomfort. The evening had passed by easily enough, and yet we had not had more than one nap. When we came to consider the explanation of this, we found that it lay in the fact that the author had not once given us any trouble. The story was plain sailing from first to last. The number of characters was happily small, and they were brought on to the stage at proper intervals. The plot, moreover, was of that kind which, common though it is, nevertheless is always interesting, where two lovers are step by step taken further and further from each other, till it seems hopeless to expect that they can ever meet, when on a sudden a return journey is arranged at express speed, and the ground is cleared in a day which had before been travelled over in a year. The story opens in a country house in the south-west of Ireland. We have noticed, by the way, that ever since the Irish disturbances began to grow to so great a height, that unhappy land has been much more frequently chosen by our novelists as the scene of their stories. Yet no advantage has been taken, so far as we know, of the eviction of tenants and the murder of caretakers, bailiffs, and landlords to heighten the interest of the tale. It is assumed, we must suppose, that while so much is talked about Ireland, people will like to read of it also in their stories, while perhaps it is suggested by prudence that a regard to one's skin will justify the writer in not taking a part in the land question. However this may be, the assumption nevertheless is curious that in our lighter reading we want to hear of Ireland. For ourselves, we would give our novelists the choice of any portion of the world; they might place their hero at the North Pole and their heroine at the South; they might even make them dwellers in Afghanistan, the Transvaal, Turkistan, or Greece, provided they would keep them clear of the Emerald Isle. That country henceforth must ever be associated in our minds with a depressing feeling of dulness. From humour and liveliness it has sued, and successfully sued, for a divorce.

In the story before us, however, the scene soon passes over into England, where it remains till the concluding chapter. We first make the acquaintance of the heroine, Gladys Byrne, and her father, the Colonel. This elderly gentleman, though agreeable enough in himself, is greatly in the way; and so he is speedily summoned to India. His return we never expected, for it is quite clear that he is marched in simply with a view of being marched out. India, moreover, is a most convenient country for getting rid of superfluous characters, what with its fevers, its tigers, its fanatics, and its snakes. Then, too, there is the chance of a wreck, either on the way out or the way home, and of a death from apoplexy in the Red Sea. However, of none of these chances does the author choose to avail herself; but she brings back the old gentleman to Ireland, to kill him off at a crisis in the story by heart disease, to the great sorrow of the heroine and to the equally great convenience of the hero. Gladys herself is of the usual type of Irish girl. All the young ladies in that island have, as is well known, lost their mothers in their childhood, and been spoilt by too fond fathers. They all have features that, though not quite regular, are yet bewitching, while their eyes are as lovely as their beloved island is green. Their education has not been carried very far, and, like our heroine, they are all "unlessoned girls." Nevertheless, even in these days of competitive examinations, all the young Englishmen who come across them persist in falling in love with them, utterly regardless of the fact that on this side of St. George's Channel there is such a vast stock of feminine learning all duly appraised and marked. Gladys is no exception to this rule, for she is greatly admired by Lancelot Chester. To this young gentleman, and to the slang that he uses, we have a very strong objection. We wish that we could convince every woman who takes to writing that it is possible for her to draw the picture of a thoroughly vulgar man, and yet not to fall into vulgarity herself. If a proof is needed of this let her turn to *Northanger Abbey*, and see how Miss Austen has drawn John Thorpe. It seems impossible to make some authors understand that slang is the dunce's humour—the only humour of which he is capable. What, for instance, can be more stupid than such talk as the following, which fills nearly a page of the story before us:—

"Are you thinking of 'ranging' yourself, as Florence said? I thought you did not intend marrying for ten years at least."

"No more I do—generally—but one can never answer for what one will do. I get sick of the old round now and then. I've been in no end of scrapes lately. Fortunately for me, The Mum is the best old lady going, and she has any amount of pocket money. I should be sorry if the governor knew a few things about me. He's down on a fellow like a hundred of bricks at times, I can tell you. When are you coming to Notting Hill? Send me a line, and I'll be home to dinner any night. We have nothing to offer anyone—it's awfully slow at home now; all the girls are married except Kitty, and she's always out."

We find this same young gentleman owing to the heroine that he had been "screwed," and telling her, as they were driving along in a cab, that they were "in a slummy part of London." He has, at length, an attack of *delirium tremens*, and tells her that he had been down to the infernal regions. His position in life, by the way, was a somewhat unusual one. He was the only son of a wealthy London banker, and yet, through the Colonel's interest, he had been glad to get a berth in one of the public offices.

A Government clerkship is not of that great value that a London banker, in his desire to procure one for his only son, has to employ the interest of a gentleman living in the south-west of Ireland. The reader soon sees that Gladys is not to be won by this young hopeful. He may repent, and become a respectable member of society—as, indeed, he does—but his wife is to be found elsewhere. He is, however, of the greatest service in drawing out the story to its proper length; and, insignificant as he is in himself, he is of no small service both to the author and the reader. For when, in one Russel Laurence, the real hero at length appears, and there seems no reason why like a hero he should not propose to the heroine in a week and marry her in a month, he is made to believe by a cunning schemer, who wished to get him for herself, that Gladys, in spite of the encouragement she had clearly given him, was already engaged to Chester. Having thereby thrown Russel into despair, the schemer takes a step which is, we believe, still unusual even in these days of women's rights, and, without waiting to see whether he will propose to her, she proposes to him. In the good old days he would of course have hanged himself, or have blown out such brains as he had left, on discovering that he had been deceived by the woman to whom he was so strongly attached; but no doubt he acted strictly in accordance with the customs of these more civilized times in at once accepting the hand that was offered him, and preparing for matrimony. A day or two after he has taken this fatal step he goes to a ball, sees the heroine in a white silk dress, set off with white roses and shamrock-leaves, and learns that he had been tricked. He nearly chokes, then talks in a broken, hoarse, terrible voice, while she looks white, has a shivering fit, looks up with an almost ghastly smile, and then passes into a dry, feverish heat. Why he could not at once go to the cunning rival, tell her that she was a liar, and break off the engagement into which he had only been induced to enter through an act of deception, the reader cannot see. Such a course never seems even to enter his mind, and he prepares to fulfil his unhappy fate. We can only regret that the author does not make the miserable Gladys at once accept the hand of Lancelot Chester. He had, indeed, intended to propose to her at the dance, and really "in his evening costume, with his fair moustache and well-cut features relieved by the snowy expanse of magnificent shirt-front, and his good figure set off by a Bond Street coat," he might have been a wooer who was not easy to resist. However, he is not accepted—perhaps because this is a story not in three, but only in two, volumes. With the little space that was left her the author must have had as much on her hands as she could get through. The heroine returns to Ireland; the day draws nearer and nearer for the marriage of the miserable, but most honourable, Russel; and, turn to whatever quarter the reader may, not a chance of deliverance seems to await him. Not a break in the clouds can be seen. We really began to be most anxious, for the heroine was getting paler and paler every day, and we remembered, moreover, that in a haunted room in her father's house a ghost had been heard not long before trailing its dress. This unearthly sound had been at once interpreted by Gladys as meaning "dreadful calamity—death." No one, so far, however, had died, and no one, except herself, seemed likely to die. We are glad to say that the ghost's credit was saved without the sacrifice of the heroine's life. The old Colonel, as we have said, was carried off by heart disease. About the same time an old lover of the artful schemer turned up from Australia, and persuaded her to take him, in spite of the strong smell of tobacco and brandy that hung about him, in preference to keeping to the virtuous and respectable Russel. There was, therefore, nothing left for the heroine but to dry her eyes as fast as she could, and, when a proper time had gone by after her father's funeral, to marry the hero. A wife was also found for the reformed Lancelot, so that even the most exacting reader must own that, whatever may be the faults of the story, there is no want in it of marrying and giving in marriage.

ENGLISH ODES.*

WHAT is an English ode? It is probable that almost everybody thinks he knows, and that very few people could succeed in giving a definition of it. A study of the very pretty little book which Mr. E. W. Gosse has edited, may, therefore, have two good results. The reader will certainly make acquaintance or renew acquaintance with some of the very best poetical work to be found in the English language. He may probably also correct his own impressions on a point of poetical science, on which those impressions are but too likely to be rather vague. The volume calls itself "English Odes selected by E. W. Gosse," and it consists of three main parts—a frontispiece by Mr. Hamo Thornycroft, a short essay by Mr. Gosse, and the odes themselves, forty-seven in number, and selected from the works of almost all the greater English poets between Spenser and Mr. Swinburne. The poems are prefaced by but a few words of introduction, but both in these and in the essay the maximum of information is given in the minimum of space. The printers have indeed been rather unkind to Mr. Gosse, for in a dozen pages they have made him speak of "Ætolian poets" and "Ætolian measures," things which would have deeply astonished and puzzled a Greek; they have made him accuse the ear of the sixteenth century of being too

* *English Odes*. Selected by E. W. Gosse. Parchment Library. London: C. Kegan Paul & Co. 1881.

dull to appreciate Milton—surely a most unkind charge; and, worst of all, they have made him give to Cowley the title of a “perspicuous,” instead of a “perspicacious,” observer. In such daintily got-up books as these the correction of the press should certainly be attended to with more, not with less, than usual rigour. But the essay itself is an excellent piece of sober and self-restrained criticism. It is really appalling to think of the spilling and splashing of words which some writers of the present day would have indulged in about such subjects as Mr. Gosse's. The fulness of fact is, moreover, usually as evident as the absence of verbiage. Although we do not exactly agree with Mr. Gosse in his view of the English ode, we find nothing to take exception to, except some rather sweeping assertions about odes not English, but French. Ronsard's first or Pindaric odes are, says Mr. Gosse, “singularly correct, although monotonous in form.” This phrase does not clearly convey the fact that, though Ronsard attended duly to strophe, antistrophe, and epode, he did not attend to what is almost as important—the variation of the length of different lines in each stanza. His lines are mostly octosyllabic, with an occasional shorter line or couplet; and thus the varied and harmonious stateliness of the ode is wanting. Again, Mr. Gosse says that Boileau's “Nemur” ode “by its turgid folly relieved French literature of a very useless tradition.” This is by no means the case, for, to name no others, J. B. Rousseau and Racine—Lebrun, the best serious poets of the eighteenth century in France, wrote odes not distinguishable in form from Boileau's, though they contained much better poetry. These, however, are matters of no great importance.

Turning to the body of the book, it may be perhaps surprising to some readers to find how many masterpieces are comprised in this selection. Spenser's *Epithalamion* worthily opens the series. It is followed by Ben Jonson's indignant but not undignified consolation to himself on the failure of “The New Inn,” and by Randolph's pleasant ode in praise of the country. Milton is represented not merely by the great “Nativity” ode, but by those “On Time” and “At a Solemn Music.” Cowley has two, as he deserves, and then Mr. Gosse quotes, what, in our judgment, is his proper sphere, and gives Marvell's merely Horatian ode on Cromwell's return from Ireland. Dryden restores the genuine tone with the Anne Killigrew elegy and the two St. Cecilia odes, and Mulgrave on music is at least admissible in form. Rochester's triplets on Nothing, admirable in themselves, seem again out of place, and Prior's burlesque of Boileau is only not out of place because it is in place almost anywhere. Congreve's beautiful piece to Mrs. Arabella Hunt returns to the orthodox form, which is more or less preserved in at least five out of the six pieces by which Mr. Gosse has illustrated the great “odists” of the eighteenth century, Gray and Collins. Akenside, of course, claims admission, but we, sterner than Mr. Gosse, should have shut the door to Warton's “First of April” and to Cowper's “Boadicea.” Sir W. Jones's “What Constitutes a State” is perhaps admissible, and Wordsworth's masterpiece introduces us to the full flower of English odes. He himself, besides that just mentioned, is represented by “Duty” and “Lycoris,” Coleridge by “France,” Landor by the address to “Joseph Ablett” (we are not sure that we should not have preferred the 1833 ode to Southey), Campbell by “Winter,” Byron by “Venice”—a rather spurious piece of rhetoric—Shelley by four, of which one at least, that to Naples, is genuine, and Keats by five, not one of which could be spared. Among these Leyden's “Gold Coin” looks a little strange. Contemporary poetry is represented by Mr. Tennyson's two splendid odes to Memory and on the Duke of Wellington, by one of Mr. Patmore's “Unknown Eros” pieces, and by Mr. Swinburne's “To Victor Hugo,” which, by the way, the author does not call an ode, at least in the original edition of the *Poems and Ballads*. All lovers of English poetry will, we think, agree that a more admirable collection would be difficult to get together in the space.

We must now justify ourselves in being “plus royalistes que le roi,” and in objecting to Mr. Gosse's admissions. The principle is only an extension of his own, which is the separation of the Pindaric ode (in which he would of course include the choric odes of the tragedians) and the Horatian. It seems to us that it is not sufficient to say that any ode which does not follow the rule of strophe, antistrophe, and epode is “irregular,” and that the precise amount of irregularity does not matter. Mr. Gosse, of course, does not say this, but his admission of Marvell's, Rochester's, and Leyden's odes, to name no others, infers it. We believe that, from the practice of English poets from Spenser to Mr. Swinburne a very definite system of ode-prosody can be evolved, and that the observation of this system constitutes and produces the special beauty of the English ode. It is not necessary to keep twist and counter-twist parallel, and to tag them duly with epode, though anybody who chooses may do this. What is necessary is to eschew mere ordinary lyrical stanzas of moderate length which follow one another monotonously. The ode is not a melody, it is a harmony; and the method by which its special harmony is produced is by arranging stanzas of more or less considerable length, not exactly corresponding with each other, and internally composed of lines also of different length, in which the longer and graver at least hold their own with the shorter and lighter measures. This apparently irregular alternation of longer and shorter lines “jumps to the eye” directly any one looks at a Pindar or an Æschylus, and it was at this and at the concerted harmony which it gives to the stanza that those who invented and those who practised the English ode, no doubt, aimed.

The same effect had been in less perfect degree attained by various Italian measures and by the Provençal *canço*, as Mr. Gosse remarks, while the French *chant royal* also feels after it, though the equality of the length of the lines keeps it below true ode-musica. It is curious that almost from the first the Elizabethan poets recognized the thing, though they often used the name loosely. Thus the “Canzons” of Barnabe Barnes are very tolerable rudimentary odes, while his “Odes” are mere minor lyrics. Jonson with his classical knowledge came nearer to the accomplishment, and Milton and Cowley in their several ways achieved it. After these two there was little to be done, and the attention to “strophe, antistrophe, and epode,” which various persons, from Congreve to Mr. Swinburne, have revived, is a detail of no importance, and perhaps hardly consonant to the genius of the English language. The important things, then, about an English ode are, first, that it shall be written in stanzas of considerable but varying length, made up of lines likewise of varying length, the sound of the rhymes and the cadence of the verses being so arranged as to make each stanza a distinct musical and metrical unit. The first part of this is fatal not merely to the so-called Horatian odes, to which there is no need to assign a separate name in English, but even to such pieces as that which Mr. Gosse has selected from Mr. Swinburne, and which is simply a long lyric composed of so many exactly corresponding stanzas. The second part brands as irregular most of Mr. Coventry Patmore's attempts which are written without division of stanzas, and are, therefore, somewhat inorganic. The two most perfect examples of the English ode are almost without a doubt Dryden's Anne Killigrew elegy, and Wordsworth's “Intimations of Immortality.” The first stanza of the first, “Thou youngest virgin daughter of the skies,” and the fifth of the second, “Our birth is but a sleep and a forgetting,” are absolute models of the ode-stanza with its complicated and independent music.

It follows from this view of the ode (which is rather supplementary than opposed to anything which Mr. Gosse has said), that there is no more difficult form of poetry, none to be less often approached or reserved for more worthy occasions. The terrible results of the once-general aspiration to be a “Pindarique poet” are but too notorious, and it must have been a temptation to Mr. Gosse to give some examples of the extravagances to which fashion can lead persons of education, and even of considerable talent. Perhaps there are few things in English poetry odder than the odes of Dr. Watts. That on the death of the Rev. Thomas Gouge, of which some specimens may be found in Southey's *Doctor*, but which well deserves reading in full, is a perfect triumph of bombastic exaggeration. These follies, however, did good in their way, by showing the inapplicability of the style to base uses. It is very unlikely that we shall have many poets who can write good odes, or that many good odes will be written by the same poet, though both Mr. Tennyson and Mr. Swinburne have in our own day shown a remarkable mastery of the ode-stanza. But, as in times past so in times to come, when a good ode is written it has been and will be one of the very best things in poetry. For collecting these examples in so pleasant a pocket-book Mr. Gosse deserves much thanks.

MODERN WILDFOWLING.

“WILDFOWLER'S” volume on wildfowling could hardly have appeared more seasonably, for the harder the winter the better the sport. As he observes in his introduction, it becomes a passion with those who devote themselves to it; and, indeed, nobody but an ardent enthusiast can hope to follow it successfully. “Wildfowler's” treatise, which is both scientific and eminently practical, should serve at once as a guide and a warning. It is full of valuable hints and instructions; nor does it merely express the personal ideas of the writer, for he impartially quotes the opinions of other experts on open questions that have been ventilated in the columns of the *Field*. But, on the other hand, he gives some appalling details of the education to which the aspiring novice must submit; nor does he by any means make light of the hardships that attend the pursuit at the best of times. In fact, the wildfowler should be gifted with the qualities that nerved our gallant amphibious adventurers of Elizabeth's reign when they went in search of an El Dorado on the Spanish main. This is what “Wildfowler” has to say of his ideal sportsman; and we may add that, should the reality fall far short of his sketch in any case, a man had far better stay quietly in his comfortable bed, in place of tempting Providence in a punt and in darkness among mud-banks. Wildfowling “is generally accompanied by a degree of peril which renders the pursuit perfectly fascinating. The all-round shooter, to be a successful man, must therefore be of a buoyant nature, and not easily put out; he must be doggedly determined at all costs to carry out his plans; he must also be hardy in his constitution; he must be a good oarsman, an excellent sailor, a good shot, and a ‘knowing’ sportsman, full of wrinkles and expedients; and he must enjoy that average amount of pluck which is a *sine quâ non* in his pursuit.” We need hardly say that it is not every man who, to an iron constitution, courage, hardihood, perseverance, promptitude of resource, and presence of mind, unites that practical skill in the use of his weapons without which his labours must end in disappointment. As for the greater and lesser perils to which “Wildfowler” makes allusion, they are

* *Modern Wildfowling*. By “Wildfowler,” of “The Field.” Horace Cox, “The Field” Office. 1880.

many and various. The punt is small, and heedlessness may upset it; not to speak of the chances of shipwreck in stormy weather. Swivel guns, with their heavy charges, have an ugly trick of occasionally bursting; and as the fowler is in the closest contact to his mounted piece of ordnance, the consequences will probably be disastrous. Even short of a thoroughgoing explosion and catastrophe, he may still come to sufficiently serious grief; for punt guns are inclined to hang fire, and the recoil is often tremendous. In the former case, "Wildfowler" warns you to wait and give the tardy ignition time to develop itself, before approaching your face in an examination of the hammer, lest you should have occasion for a complete set of artificial teeth. In connexion with this violent recoil he relates a little personal anecdote of how, in pulling a stiff trigger directly with his fingers, he smashed all the nails on his trigger hand, which must have gone near maiming him, at all events for the cruise. Still more essential is it to see to the security of the punt, should circumstances have induced you to go ashore and part company from it. If it is not properly attached, the tide may wash it away; or, unless provided with the bump of locality and a good compass, you may go wandering about the saline swamps in search of it. We can conceive no more horrible adventure in the romance of everyday sport than the being cast away on "a sad sea bank" in a mounting tide, and with the knowledge that the minutes are numbered in which the boat must be recovered. Indeed, "Wildfowler's" "first single-handed punting trip" is so striking an illustration of such perils that we cannot resist condensing it. He had started towards dusk, making pleasant progress down mid-channel on an ebb-tide. Birds were to be heard in abundance on the wing overhead and on the shores on either side of the narrow estuary; but still the novice could distinguish no floating group which he might stealthily approach for a "family shot." At last his sinking spirits were revived by the sight of some of the longed-for objects dropping down on the tide. He stalked them with such admirable caution and skill that there was not a sign of agitation among his unconscious victims; when, as he had adjusted his gun for the deadly shot, he discovered that he was covering some floating hampers which had been tossed overboard, no doubt, from a passing barge. Rallying from the disappointment, he paddled on, till he was half-broken by fatigue, and reeking besides with perspiration in spite of the intense cold. Hitherto he had come upon nothing in the way of wildfowl. At length he did hear and see a flock of birds in a shallow, and approaching them in the shadow of the flats, he hazarded a long shot. Punting up to the spot, he was delighted to find that one bird had been left in the mud, and, in his excitement, he jumped lightly to land to retrieve it. The land proved to be treacherous mud, of yielding substance, but great tenacity. "Wildfowler" was waist deep in the ooze. As he struggled to extricate himself, he only sank the deeper; and—we could hardly conceive such a thing did he not assure us of the fact—the ruling passion was still so pronounced in him that, as he saw his victim fluttering away, he stopped it with a double discharge from his cripple gun. Having effectually disposed of the duck, he could turn his thoughts to his own end. And that seemed inevitable and fast approaching, by a doom somewhat similar to that of Edgar at Ravenswood. By that time he had disappeared in the mud, up to the armpits; and so it was of the less consequence to him that the punt was working loose from its moorings, seeing that he was exceedingly unlikely to have any further use for it. In his extremity, he lifted up his voice and shouted, scarcely dreaming that help could come to him in those solitudes. Human voices answered him out of the darkness; and, to bring his adventure to an end, he was rescued by a veteran punter, who, suspecting that the youth might be landed in difficulties of some kind, had followed him in his probable course, in the hope of coming in for a salvage job.

After so thrilling an experience of danger as that, there is something like bathos in descending to the mere hardships of the fowler's pursuit. But while men who observe reasonable precaution need never jump so recklessly into the jaws of death as did "Wildfowler," yet every shooter has to face the cold habitually. The dress, then, is a matter of the last importance; and "Wildfowler's" suggestions as to the most suitable night toilet will give an idea of the normal temperature of promising weather for the birds. There should be sundry underlayers of flannel shirts and jerseys, over which a jacket of chamouis leather will be found useful; while the coats are covered with the white smock frock or overfall. The legs are got up in swathings of flannels and woollens, and it is recommended that their outer casing should be of oil-skin. Long woollen stockings may be multiplied, à discrétion, with sea boots coming up on the limbs to the mid thigh. "In short, when rigged out for winter punting, a man should look double, or pretty nearly, his usual size, and he should not feel cold even when inactive for hours." Great attention must of course be paid to the gloves. "Wildfowler" prefers woollens, worn as thick as possible. They should be made like mittens, with the fingers together and the thumb separate; but in the glove for the right hand there ought to be a hole through which the forefinger may be thrust, when the shooter, going after his cripples, betakes himself to a shoulder gun. The objection to woollen material is that it gives the hand a less firm grip on the gun. But the risk of "muffing" an occasional shot is preferable to that of frost-bitten fingers. Talking of missing shots, "Wildfowler" has some very sensible observations on the quantity of shot and powder that is almost inevitably wasted by the most skilful sportsmen on their seafowling expedi-

tions. Men are much inclined in all honesty to minimize the number of their misses in the retrospect; but "Wildfowler" speaks confidently from his own experience, and he ought to be an excellent judge. Moreover, his assertions are confirmed by common sense. As he says, there is no place like the sea for bad aiming, as there are no objects more difficult to hit than crippled wildfowl. The boat is dancing beneath you, while the bird is bobbing on the waves; the shooter is chilled, the tackle of the craft may get in his way, and his best-directed shot may be stopped or turned aside by the water. And "Wildfowler" recalls one special incident, when he and a friend expended upwards of twenty charges on a winged mallard before they succeeded in putting it out of its misery.

In the brief limits of an article intended for general reading we have not even attempted to go into those technical chapters of the book which must be invaluable to the sportsmen for whom they are meant. "Wildfowler's" minute descriptions of punts, punt-guns, and punting appliances are profusely illustrated by engravings and exact diagrams, which supply ample means of comparison between the most recent inventions and improvements. We may merely mention in passing that he is all in favour of breechloading punt-guns; pointing out how independent they make the man who must recharge in the dark when he is provided with a half-dozen of loaded steel cartridge cases. Nor can we do more than allude to his notes on the habits of the various wildfowl, although an intimate acquaintance with those habits is absolutely indispensable to the shooter who, in the words of the Baron of Bradwardine, aspires to become a "deacon of his craft." But, before concluding, we shall select, by way of specimen of the lighter portions of the volume, "Wildfowler's" reminiscences of a day's coot-shooting near Montpellier, which we feel assured will be full of novelties for most people. For ourselves, we confess we had no idea that coots congregated anywhere in such numbers as he describes; nor did we know there was such a resource as coot-shooting on "the broads" to be had in the neighbourhood of one of the dullest and most wearisome of health resorts. Lounging one day through the streets of Montpellier, "Wildfowler" came to a dead point at a placard headed "*Grande chasse*," in great capitals. It advertised a day's coot-shooting over an adjacent lake, intimating that "millions of coots" were on the water—cost of admission, five francs. "Wildfowler" and a friend, after "taking informations" from their landlord, resolved to be present. On the morning in question they found themselves on the shore of the broad in a crowd of at least five hundred shooters. They had arranged beforehand for a boat with the services of a couple of boatmen. After passing through a narrow entrance, and duly paying the gate-money at a wicket, they launched out in a great flotilla, amid unspeakable turmoil and confusion. For some time the "sport" was tame enough, and the strangers began to repent having joined in it. There was no wind; the lake was like a looking-glass; yet the only visible birds were some sea-gulls and plovers; when one of the boatmen suddenly exclaimed, "*Voilà les macreuses!*" "and sure enough a large black crowd of coots was visible some 300 yards in front of us; and on narrow inspection, further on, another immense flock of them seemed to cover the surface of the pond." The flying squadrons of coots actually charged the boats, as if determined to force the line; the fire-firing was incessant and tremendous; and "the birds fell like hail" all around the punts. After tremendous slaughter, notwithstanding wretchedly poor shooting, the guns landed to break the day with an exceedingly jovial luncheon-party on the shore. When the bag was counted for division in the evening, it was found to contain about twelve hundred coots, of which the two Englishmen calculated that they had killed about an eighth, although only eight of the birds were allotted them in the general distribution.

SOME RECENT SCHOOL CLASSICS.*

A FITTER leader of our large group could scarce be found than Professor Mayor's elaborated edition of the Third Book of Pliny's Epistles. Regarding his author's beauties as far out-

* *Pliny's Letters.* Book III. By John E. B. Mayor, M.A., Professor of Latin, Cambridge. With Life of Pliny. By G. H. Rendall, M.A., Fellow of Trinity, Cambridge. London: Macmillan & Co. 1880.

M. Tullii Ciceronis Cato Major sive De Senectute. By the late George Long, M.A., formerly Fellow of Trinity College, Cambridge. Cambridge: Deighton, Bell, & Co. London: Whittaker & Co.; Bell & Sons. 1881.

M. Tullii Ciceronis Latius sive De Amicitia Dialogus. By the late George Long, M.A. Same publishers. 1880.

Livy.—The Hannibalian War. Being part of 21st and 22nd Books of Livy. Adapted for Beginners by G. C. Macaulay, M.A., Assistant-Master of Rugby. London: Macmillan & Co. 1880.

First Readings in Latin; with Vocabularies and a Short Accidence. by G. F. H. Sykes, B.A., Author of "Grammar through Analysis." London: W. Isbister, Limited. 1880.

Homer.—Iliad. Book XXI. With Introduction and Notes by Herbert Hallstone, M.A., late Scholar of St. Peter's College, Cambridge. Oxford: Clarendon Press. 1880.

Homer.—Iliad. Book XXI. By Arthur Sidgwick, M.A., Tutor of Corpus Christi College, Oxford. London, Oxford, and Cambridge: Kivingtons. 1880.

Aristophanes.—The Acharnians. With Notes, Introduction, and Diacritical Glossary. By W. W. Merry, Fellow and Lecturer of Lincoln College, Oxford. Oxford: Clarendon Press. 1880.

The First Four Books of Xenophon's Anabasis. With Notes adapted to Goodwin's Greek Grammar. Edited by W. W. Goodwin, Ph.D., Elliot Professor of Greek Literature; and John Williams White, Assistant Professor in Harvard College. London: Macmillan & Co. 1880.

weighing his defects, he has sifted the commentaries of the greatest foreign scholars, and engrained his own annotations "without thinking it worth while to claim every little piece of his own property by enclosing it in crotchets." His text is mainly H. Keil's (Leipzig: Trübner, 1870). He cites Mr. J. D. Lewis's translation of Pliny's Letters as the best and cheapest in the language, and he shows both by precept and example how greatly the debt of lexicography might be lessened would patient labourers but digest one neglected "testis linguae." His own life-labours of exact annotation point a moral, even in his reading through and noting Silius and his Latinity as a *πράξις*, to say nothing of the accumulations around Juvenal, Quintilian, and this Book of Pliny, of which he has enhanced the attraction by a short Life written by Mr. Rendall. Pliny owed to his uncle and adoptive father not only name and estate, but also his addiction to study, and "indefatigable industry at note-making." On his relative's death at the eruption of Vesuvius in A.D. 79, the younger Pliny mapped out for himself an official career, and with this view shortly became an advocate and a "Decemvir talibus judicandis," varying this routine of probation with an equally prescriptive term of military service, which was however no doubt perfunctory. After this he was busied till his twenty-fifth year and entrance into official life in the Centumviral Court—the Chancery of Rome. In 89 A.D. his official life began under Domitian, and he seems to have set his foot on each round of the ladder, signaling his tenure of each office, save the Tribunate, with some famous public prosecution. Rescued, it is probable (Epist. III. ii. 3), from the imminence of death at the instance of delators by the Emperor Domitian's assassination, he threw and was promoted to higher office under Nerva, and attained the consulship in January 100 A.D. under Trajan, his chief patron. His First Book of the Letters appears to have dated in 97 A.D., the rest following rapidly, and the last in 109 A.D. "They present," says Mr. Rendall, "in the utmost fullness and diversity one side, but one side only, of Roman life, in all the phases of outward self-expression and relation, of the official, cultured, genteel society of the period." Eminently tender of the susceptibilities of contemporaries, Pliny's correspondence very rarely violates good taste. As a family man, to his wives, his slaves, and dependents he was blameless in advance of his age. In society an optimist, in private life a pedant, he revised and elaborated his letters and speeches, which are often marred by tricks of rhetoric. To the editing of Professor Mayor's Third Book of these Letters we can devote but a hasty glance, but must be understood to regard it as fully deserving of ampler treatment. The twelfth letter is to Oatilius Rufus, and sportively accepts an invitation to dinner, provided it be light and frugal, abounding only in Socratic discourse. "If we sit too late," he writes, "we shall fall in with *officia antelucana* (*clients bound before dawn to their patrons' levees*), where *officia* is explained by the editor as the abstract for the concrete, as in Juv. x. 64 we have "Præcedentia longi Agminis officia," a long suite"; and in Apul. iv. 31, "Marinum obsequium," an escort of sea-gods." "Even Oato," goes on the epistolist, "could not escape them, though Cæsar where he blames him is fain to praise him. For they blushed to detect Oato in his cups ('cum caput ebrii retexissent'); you would think he had detected them." As we are no Oatos (is the inference) let our dinner be sparing of time as of cost. The letters to Cornelius Priscus on the death of the poet Martial (21), and to Caninius Rufus on that of Silius Italicus (7), may be pointed out as specimens of almost exhaustive annotation; and, what with the summaries at the opening of each letter, and the headings at the top of each page of notes, we cannot conceive a more thoroughly elaborated *vade-mecum*.

The specialty of the reprint of *Cicero de Senectute* and *De Amicitia* is the reprint of Mr. Long's Notes and Introduction from the "Grammar School Classics," which are models of concise and independent annotating. The veteran scholar was averse to copious noting, and seems to have searched his MSS. and authorities more in elucidation of the right reading than for lateral illustration. Yet his longer notes, such as at *De Senect.* § 71, on the sense of "*Secundum Naturam*," are always instructive; and that on "*Apud Xenophontem*," § 79, which counsels a comparison of the *Cyropædia*, viii. 7, with Cicero's text, and a student's endeavour to make his own Latin transcript of the Greek, in comparison with Cicero's version is eminently practical. Grammatical notes, such as that on "*Quoad*," which he compares with "*adeo*" in p. 24, § 72, are always sound and trustworthy. The *De Amicitia*, says the editor in his preface, represents Cicero's exposition of friendship as founded on the Roman notions of virtue. Mr. Long regards it rightly as a much more puzzling argument to apprehend than the plain, blunt discourse of Cato, and advises its being read later in order. The dialogue between Fannius, Lælius, and Scævola is enriched by frequent quotations from Terence, Plautus, and the earlier Latin poets.

The *Hamidian War*, as Mr. G. O. Macaulay sets it before beginners in a volume of "Elementary Classics," though not the work of a veteran, is that of a shrewd and practical scholar and teacher, grappling manfully the problem of finding interest for beginners in the text of Livy, largely rewritten and simplified, with occasional details from Polybius. To this task he has been impelled by finding Cæsar and Nepos, and any medley of extracts, ill adapted for embryo scholars. In the account of the Second Punic War there is enough of sustained interest to make Mr. Macaulay's narrative attractive; and we observe that his notes very largely consist of references to the pages and sections of the *Latin Primer* and Roby's *Latin Grammar for Schools*, knowledge

of the contents of which references he would have a good master rigorously exact. But he does not overlook any needed information amidst his zeal for grammar notes, illustrating alike distinctions of warlike engines, such as the "*vimæ*" or "*roofs on wheels*" of c. x. and "*Turres mobiles*" or platforms to put the attackers on a level with, or above, the defenders, of c. xli., and differences betwixt Latin and English land measures, as in c. ix. The volume has a good index, map, and introduction.

Mr. G. H. Sykes, B.A., claims for the idea of his *First Readings in Latin* the suggestions of the late George Long, and, more than this, the method of as old a "schoolmaster" as Ascham. This was to turn all extracts from Latin into English, and reconvert them into Latin at a little interval; and Mr. Sykes has thrown his extracts into six graduated sections for this purpose, appending a very simple array of syntax rules, a condensed Latin accidence, and some eighty vocabularies. As far as our observation serves us, the passages are well chosen, and the helps regulated with an eye to the translator's progress.

Turning to the Greek books on our present list, we find that Mr. Hailstone and Mr. Sidgwick vie with each other in treating a book of the Iliad. This is, in some respects, a special book, for the slaughter beside the river Scamander in which Achilles exacts quit-money for his comrade Patroclus, is only secondary to the 22nd Book, which inflicts adequate toll in the death of Hector. In the *μάχη παραποτάμους*, or fight near the river, as this book was originally called, there is no lack of incident, of pathetic appeal or of stirring conflict, the central hero of the Greeks revolving single-handed in his might, and crushing all opposition with his relentless steel. Lycaon's premature death, though he pleads that he is not Hector's own brother, under peculiarly bitter circumstances, does not prevent the vengeance of Achilles extending itself to the chief of the Pæonians, Asteropæus of the race of the river god, himself spurred on by Xanthus to oppose the destroyer. But even his gallantry fails to make head against the goddess-born hero. Asteropæus is pierced through the belly, and his body left weltering on the sands, whilst Achilles pursues the Pæonians without their leader. At this point the river-god interposes to put a stop to such wholesale slaughter, and hurls all his torrents against Achilles, who plunges into the crowded stream, and speedily avails to fill the battle-field with such allies as the gods, Poseidon and Athene, Hephæstus, and others. Altogether, the book has been well chosen, and it seems to us that both editors have discharged their task with care. Mr. Sidgwick, whom we have met before in the earlier books, repeats his introductory matter and his notes on epic forms, &c., in this book; but it will be found that he has given due attention to matters of syntax and construction which crop up. At v. 10, for instance, he draws attention "to the tendency of prepositions in their adverbial stage to accumulate" (*ἄρχει δ' ἀμφὶ περὶ ἄλλων*), whilst Mr. Hailstone supplements this illustration by the parallel phrases, *διὰ τὸ, παρὰ, ὑπὲρ*, the Latin "*circumcirca*," and, from Thucyd., *ἀπὸ βοτῆς ἐνεκα*. At v. 40 we are told of Achilles's capture of Lycaon, and that he *ἐνέπρασεν*, "carried him off for sale to Lemnos," or, as Mr. Sidgwick notes, "took him over with a view to selling." The young Homeric student will find much matter for inquiry and a fertile field in this book of Homer, which is possibly designed for a book to be examined in. Perhaps we should single out Mr. Hailstone's notes as the more various of the two, the specialty of Mr. Sidgwick's being epic forms and derivations.

Mr. Merry's instalment of the *Acharnians* of Aristophanes is a very creditable earnest of a handy edition of Attic comedy from the Clarendon Press. The *Acharnians* has always been a popular, amusing, harmless play, designed to depict the charms of country life for the peace-loving Athenians, and sparkling with wit and humour in its various situations from first to last. It would be hard to find a livelier introduction to Aristophanic comedy than this sprightly play, so well and thoroughly edited as it is. Perhaps it is characteristic of Mr. Merry that he gives comparatively little play to the punstering spirit which possessed Mitchell, Walsh, Green, and other Aristophanic scholars; though at times it will have its way, as when, in 234, Aristophanes introduces the words *βλέπειν βαλλήναδ*, "to keep a sharp look out towards Pallene" (a well-known field of action), and by a punning play on words the implication is "to wear a look that threatens pelting." Here Mr. Merry suggests that it might serve our purpose to translate "to look like 'Hur-lingham'"; just as, in 406, he would make *Χαλλεῖδης*, possibly only a fanciful name, invented to enlist the sympathies of Euripides with a member of the hamlet of lame beggars, *χαλῶλ*, "a wardman of Cripple-gate or Crutched Friars." But it will be found on examination that the pains bestowed on a thorough perception of the point of the play is equable and minute. But it is impossible to do justice to such careful work in a general article. The reader will find Mr. Merry's work especially accurate as touching historical and dramatic allusions, and the salient points of the play, which is one to be recommended as a taste of the Attic comedy.

The last book on our list is a new idea from our American cousins, an idea from two Professors of Greek Literature in the University of Harvard, from which we may with advantage take a hint. Professing to edit the first four books of the *Anabasis* on the principle of equal division of work, Mr. White prepares the notes to Books I. and II., Mr. Goodwin to Books III. and IV.; but the labour of Book I. has been obviously the heaviest, because, that surmounted, a great deal of the rest is reiteration and reference. In truth, these notes give the impres-

sion of elaborated method, and, while profuse in disowning pretensions to great learning and research, rely entirely on systematic grammatical aid thoroughly and frequently indoctrinated. The history is warranted by its being based on the teaching of Mr. Grote; the geography assured by a handy map copied chiefly from Kiepert's map in Rehdantz's German edition of the *Anabasis* (1873); and whilst we have rarely seen a classical edition of an author in which fewer words were wasted, we have a strong belief that a sturdy growth of scholars would be likely to follow from the practice and instruction of Messrs. Goodwin and White's teaching.

AN OCEAN FREE-LANCE.*

THE late Emile Gaboriau chose a spy as the central figure of his most remarkable novels, and Mr. Clark Russell, inspired doubtless by the same desire for originality which prompted this eccentric choice, has in his latest work endeavoured to make a hero of a privateersman. He certainly deserves some credit for his audacity, as it would be difficult to conceive a less promising subject; for even those who have the least sympathy with the humanitarian sentiment of our time are little likely to feel anything but contempt for the men who went forth, not to fight for their country, but to prey on unarmed ships for the sake merely of gain. In some cases, no doubt, the privateersmen of the old war were men of courage and enterprise; but the record of their achievements is not large, and, as a rule, their sole object was booty. In one respect, indeed, they were below pirates, for the pirate sailed with a rope round his neck, while the privateer seaman had nothing more than gaol to fear. Very hard, indeed, is it to feel any sympathy with those mercenary sailors, but nevertheless a writer of true literary skill, thoroughly acquainted with the naval history of the great war, and with the character of the seamen of that day, might possibly turn the really despicable privateersman into something like an heroic figure, just as the French author above mentioned has made a spy seem noble. Mr. Clark Russell, as we shall presently show, possesses none of these qualifications, but he has notwithstanding boldly striven to make privateersmen attractive, and in doing so has certainly given proof of possessing as a writer that virtue which his favourites occasionally lacked—unhesitating, not to say unthinking, courage.

The story of *An Ocean Free-Lance*, in some respects one of the funniest that even the eccentric novel-writers of our day have produced, is told in the first person, and is supposed to be the narrative of Mr. Madison, first mate of the privateer schooner *Tigress*, which worried the French in 1812. Mr. Clark Russell is one of those edifying writers who, not content with exercising their own imaginations, make some demand on the imagination of their readers; and certainly any reader who is so far carried away by this romance as to believe for an instant that Mr. Madison's language bears the smallest resemblance to that of a sailor of George III.'s time will give proof of imaginative power of a very high order. This rough child of the ocean shows a most remarkable command of the jargon, which for want of a better name we will call late Ruskinian, and is a complete master of the colourman's catalogue style of writing, known as word-painting, which became fashionable some fifty years or so after the time when he is supposed to have flourished. The following are fair specimens of his descriptions:—

The clouds were now tumbling up out of the sea, and slanting athwart the stars pretty thickly, and the water was full of shadows, amid which the moonshine fell down in lines like slender cascades of molten silver, touching the black troubled surface here and there with points of brilliance as sparkling as the flash of diamonds, while the breaking waves glittered like the star-dust in the sky, as their foam crossed the path of these beams.

Her [the *Endymion*'] double lines of guns grinned along the white streaks, and the green and foamy surges topping against her huge side looked, by contrast with her bulk, no more than the ripples of an inland lake. Her long pennant flashed like a line of fire against the deep azure, and, starting from that great altitude, the eye ran down a succession of widening sails and spars of black rope, and the exquisite lacework of the thin, running gear. . . . And a small bed of foam hung like a heap of snow at her stem, and twinkled frostily along the gold-bronze metal armour that sheathed her bottom.

These be brave words truly, very fine English indeed, and singularly like the utterances of the mate of a privateer in the year 1812. No doubt a writer cannot help using the language of his own time, but no writer is justified in going out of his way to use a strongly-marked style which belongs as essentially to his own time as euphuism did to the reign of Queen Elizabeth. Mr. Clark Russell would scarcely have been guilty of a greater anachronism if he had made his first mate look out for steamers in the Channel and speculate on the news by the Atlantic cable. Anachronisms may, however, be pardoned for the sake of a stirring story, and a stirring story the author has certainly endeavoured to produce by making his hero perform feats as remarkable as those of Amadis of Gaul or Jack the Giant-Killer. The real hero of the tale is not, we should observe, the word-painting Mr. Madison, but one Shelvocke, who, it seems, was an actual, living sea captain, who commanded a privateer in the latter years of the war. At the time when the story opens this person has just been appointed to the command of the schooner

Tigress, which is described as of 323 tons. This, by the way, would have been a most astounding size for a schooner in the year 1812; but we do not quarrel with it, as a vessel which had to carry so singular a commander as Captain Shelvocke appears to have been and so peculiar a first mate as Mr. Madison must needs have been an exceptional one. With these two skilful officers on board, and two others under them, the schooner hauls out of dock, drops down to Erith to take her powder on board, and then sails down the Thames. According to the narrator of her exploits, she excited great attention as she glided along the river, and here, doubtless, is a touch of truth, for assuredly, had such a vessel as the *Tigress* been seen on the Thames at the time he speaks of, she would have occasioned no small excitement. Possibly, however, any one who had gone on board her might have felt some doubt as to her being formidable to the French. Although everything about her first sail is described with the minutest detail, we never learn that either in the Thames or out of it the valorous Captain Shelvocke ever told the men off to quarters, i.e. to their stations at the guns, ever named captains of guns, ever made the most elementary preparation for fighting his ship. The author is apparently of opinion that naval gunnery comes naturally to seamen, and that no kind of stationing or practice is necessary for those who may be called on at any moment to fight the guns. Most devoutly must many a weary first lieutenant and gunnery officer have wished that it were so. However, Mr. Clark Russell is a merchant seaman, and it would not be fair to be hard on a merchant seaman for being totally ignorant on this point; but with regard to seamanship he ought to be exact, and it must be said that the seamanship of his hero is of a peculiar kind. We learn that when the vessel was abreast of Sheerness the wind had got to the north. She was sailing along the coast to the eastwards, and therefore had the wind abeam or a little abaft the beam, yet we are told that Captain Shelvocke furled his square canvas; and from a passage at p. 59 it appears that his mainsheet was well in. Seemingly, this eccentric privateersman was under the impression that a schooner could only carry her square foretopsail when the wind was on the quarter, or dead aft, and that the mainsheet ought to be in with the wind abeam. To do Captain Shelvocke justice, however, although he could neither station men at guns nor handle his ship, he could, as became a hero of romance, make a speech. At sunset he calls the hands, not to tell his men to look to breechings and tackles, or to teach them to train, elevate, depress, and aim, but to talk some feeble stuff to them wherewith they are greatly contented—their intuitive knowledge of gunnery being doubtless made perfect by the captain's words. Very shortly they have an opportunity of availing themselves of their heaven-granted gift, for adventures come thick and fast to the *Tigress*. During the night a voice is heard from the waters, and two sails are sighted. The man who hailed from the deep is picked up, and turns out to be one of the crew of a smuggling cutter which has been taken by a French lugger. The cutter is burnt by the crew of this vessel, which, of course, tries to escape; but the swift *Tigress* follows, and marvellous is the skill shown by the intuitive gunners. Although the light is so deceptive that Captain Shelvocke cannot tell whether the chase is two miles off or five, his men hull her with such precision that she sinks in an attempt to reach a shallow channel in the Goodwins; at which the gallant Shelvocke is aghast, as well he might be. Before very long, however, adventure comes to sweep away all feeling for the drowned men. Having fought in the dark, the *Tigress* proceeds to fight in a fog, and we certainly think that a fog must have been more congenial than anything else to such a very dazed person as Captain Shelvocke. A thick mist comes on; but the crowing of that obtrusive bird a cock reveals the fact that there is a vessel near the schooner, and a momentary lifting of the fog shows her to be a large ship, and speedily an action begins. The stranger, of course, is captured, and turns out to be an English vessel which has been taken by a French privateer, and has a prize crew on board. Very remarkable, indeed, must have been the courage of the French privateersmen, as they succeeded in cutting out the merchantman when an English brig of war was close by. Truly Mr. Clark Russell is daring in his incidents; and he is—unconsciously, perhaps—true to nature when he makes the idiotic merchant captain who has been caught napping complain of the cowardice of French privateersmen.

At the time when the dull fellow makes this singular accusation the *Tigress* has been, so far as we can make out, rather less than twenty-four hours at sea, and during this period has sunk one vessel and recaptured another. She is not to be allowed any rest, however, for scarcely have the foolish merchant skipper and Captain Shelvocke gone below when a sail is sighted on the port quarter. She is speedily made out to be an armed vessel, as fifteen "gunports"—to use the author's word—are counted on her side, and Mr. Madison pronounces her "as stout a twelve-hundred-ton ship as ever was launched." She is afterwards described as "a 38-gun corvette," carrying—Heaven save the mark—twenty-six 64-pounder carronades and some long 18's. It is scarcely necessary to point out the absurdity of this description. In those days a vessel of twelve hundred tons carrying thirty-eight guns would have been a frigate, and would have been thought a large frigate. The three famous ships set afloat by the Americans, which were regarded as perfect Titans amongst frigates, were of fifteen hundred tons only. However, we must not be angry with Mr. Clark Russell. Having put his maudlin captain on board a nearly impossible schooner, it is only natural that he should make him

* *An Ocean Free-Lance: from a Privateersman's Log*, 1812. By W. Clark Russell, Author of the "Wreck of the Grosvenor," &c. 3 vols. London: Richard Bentley & Son. 1881.

fight an utterly impossible corvette. To criticize the long account of the conflict between the two vessels would be a waste of time; but one point may be noticed. The only conceivable chance for a vessel like the *Tigress* in such an action would be to keep at a great distance from her antagonist. She is, however, brought within easy range. The proceeding, no doubt, seems eminently characteristic of such an unmitigated booby as Captain Shelvocke appears to be in the pages of *An Ocean Free-Lance*; but it would have inevitably resulted in his schooner being blown out of the water. Unfortunately, Mr. Clark Russell is not content even with a novelist's privilege of making his imaginary vessel do wonderful things and escape when she ought to have been destroyed. He must needs deal with a real vessel, with an actual man-of-war which once floated the salt seas. Towards the end of the action an English war ship appears, and we are informed that her name was the *Endymion*, and more than once that she was a two-decker. As a matter of fact, the *Endymion* was a frigate, and a very famous frigate. She was afloat in the summer of 1812, and then carried twenty-six long 24's on main-deck and eighteen 32-pounder carronades and two long 9's on quarter-deck and fore-castle. Afterwards her battery was increased. She is, as we need hardly say, celebrated as having been the ship which virtually captured the *President*, though that vessel actually surrendered to the *Pomone*. Very strange is it, then, that Mr. Clark should speak of the *Endymion* as a line-of-battle ship; but stranger still is it that he should not be content with this blunder, but should go on to make the French lieutenant of the captured vessel inform Mr. Madison that the *Endymion* was once the *Renommée*, and carried the flag of Admiral Villebert. Who Admiral Villebert may have been we are not aware, history being silent as to his exploits. Can Mr. Clark Russell mean Admiral Villeneuve, and is it possible that he does not know the name of the famous and unfortunate French officer who commanded at Trafalgar? The *Renommée* never carried the flag of Admiral Villeneuve, and indeed was not a line-of-battle ship, but a frigate. She did carry the flag of Commodore Roquebert, who, when in command of her, achieved the very rare distinction of taking an English frigate. Aided by several consorts, the *Renommée* captured, on December 13, 1809, the British ship *Junon*. The disaster was subsequently avenged by Captain Charles Schomberg, who, in the action off Tamatave, fought on May 20, 1811, made a prize of the *Renommée*, the gallant Commodore Roquebert being killed in the engagement.

Most unlucky, then, has Mr. Clark Russell been in his choice of names, and after these proofs of his want of knowledge of the naval history of the period to which he has chosen to assign his story, and the sample we have given of his narrative, our readers will scarcely wish us to pursue further his account of the cruise of the *Tigress*. A variety of remarkable adventures befall the feeble captain and sentimental first mate of that vessel; and on one occasion the author goes out of his way to show that he knows as little of American as he does of French or English men-of-war. When a vessel which is sighted proves to be an American, Captain Shelvocke exclaims, "Do you know that she may prove the *Constitution*, or the *Hornet*, or worse still, the *President*? one of those vessels I'll swear she is; in which case she will be carrying over fifty guns and four hundred men." Every one who has glanced at the history of the war between Great Britain and the United States must know that the *Constitution* and *President* were huge frigates, and the *Hornet* a 20-gun sloop. The *Tigress*, as need scarcely be said, escapes from the American; but the description of the escape is faulty. An American frigate in the position described—namely, on the schooner's weather quarter, and a league to windward—would have quickly caught her without the smallest difficulty. Mr. Clark Russell overlooks the difference which size makes in the relative speed of vessels. After this escape the *Tigress* recaptures an English merchantman which had been taken by a Yankee privateer. On board her Mr. Madison discovers Miss Madeline Palmer, with whom he had previously fallen in love, and to his great delight he finds himself in charge of the recaptured ship with this young lady under his care. After a time the ship takes fire, and the privateersman and the damsel are left adrift in a boat, but of course no harm can come even to a subordinate hero of romance. Having found his lady-love in one ship, Mr. Madison finds his future father-in-law in another, for on board an English man-of-war which picks the two up is Colonel Palmer, the parent of Miss Madeline. The Colonel benignantly approves of a union between his daughter and the privateersman; and, with a picture of the happiness of the lovers, the marvellous tale comes to an end.

So far as it is possible to criticize seriously *An Ocean Free-Lance*, it must be severely condemned. The author has chosen an unpleasant subject; and, in an attempt to redeem its unpleasant character, has only succeeded in making his narrative ridiculous. On the strength of some acquaintance with the modern merchant service he has tried to tell a story of the old war. That he should have attempted a task for which he is unfitted is to be regretted, as, despite his passion for word-painting, he has considerable ability. He has shown in his previous works that he can describe life on board a merchantman extremely well, and his love-scenes are sometimes pretty. To the adventures of cargo-carrying ships and the flirtations of sentimental first mates with very nice and well-behaved young ladies he had better confine himself in future, for the ships and sailors of the great war are beyond his power of limning.

MINOR NOTICES.

MR. W. D. HAY'S *Three Hundred Years Hence* (1) is better than some other works of the Utopian or (to borrow M. Renouvier's coinage) Uahronian kind that we have seen, but not up to the level of the best. The book consists of a popular course of lectures supposed to be delivered A.D. 2180 by the Professor of History in a mid-Atlantic city built (as all inhabited cities by that time are) in the manner of a gigantic lake-dwelling. The surface of the earth has been found too valuable for agriculture, in view of the enormous increase of population, to be any longer encumbered with buildings, and there has been a general exodus of mankind to new cities out at sea. Venice may perhaps have been allowed to go on existing, though it is not mentioned. The ancient buildings and monuments deemed worthy of preservation have been moved bodily to the new sites, a feat which presents no difficulty to the engineering of the twenty-first or twenty-second century. Wars between civilized nations have come to an end in the twentieth century, the means of destruction supplied to the European Powers by American inventors having made fighting impossible. Monarchy has become extinct along with war, and the peaceful progress of mankind, now allied in a single and indivisible oecumenical commonwealth, and using English (it would be a sad kind of pigeon-English, we fear) as their universal language, has been interrupted only by the painful necessity of exterminating the Chinese and Negro races, which have shown themselves hopelessly irreclaimable by attempting to levy war on the white man. The other inferior varieties of man have been painlessly extinguished by absorption in the growing and spreading white population. Even the domestic animals have disappeared as superfluous, and mammalia in general exist only by the special preservation of a limited number as curiosities. No particulars are given of the doubtless excellent substitutes for butter and milk which are to appear at the breakfast-table of the future, nor are we told of what stuff the man of the future will make his coats and shoes. But the chemistry of the future will of course provide for all this. In addition to the ocean cities there are a good many submarine and subterranean establishments for various purposes, where with electric lighting and artificial atmospheres people find life not only practicable but pleasant. Air-ships are the common mode of conveyance, and railways have become obsolete except in the underground workings, where they are still used in an improved form for travelling and commerce. All smoke is abolished, and the weather is regulated by a body of meritorious and hard-working specialists officially set apart for that purpose. The fashions and tone of society are set by an elective Empress, for whom a splendid Court is kept up in the South Sea Islands, and who has no political function whatever. A judicious silence is observed on the state of literature and the fine arts. Mr. Hay's Wagnerian readers, if he has any, may dream of gorgeous performances of the Nibelung trilogy (by that time venerable, and pleasing by its archaic simplicity) in the new cities of the sea, or his Philistine ones may suppose all music above the compass of an improved barrel-organ to have been abandoned by those more enlightened ages.

There is a good deal about the progress of science and invention; and, as one might expect by the nature of the case, this is the weakest point of Mr. Hay's work. To do it well would require a thoroughly sound foundation of general physics and a considerable detailed acquaintance with one or two special sciences, besides a powerful constructive imagination. In short, the writer would have to be himself a man of science, an inventor, and something of a poet. The late Mr. Babbage could probably have done the thing, if the fancy had taken him, as well as any one. The difficulty of the task may be estimated by looking back and considering how very few successful prophecies of the kind there have been. Erasmus Darwin's well-known address to "unconquered steam" is probably the best example, and it really deserves much credit, for we must remember that when he wrote the application of steam to locomotion was not yet seriously thought of. We cannot say that we think Mr. Hay's imaginary discoveries good of their kind. For the most part they are neither entertaining nor plausible. It shows a certain poverty of scientific imagination to think of nothing but new forces, nor are those introduced in this book, as a rule, even admissible. Before calling in a new force to keep the planets in their orbits, Mr. Hay should have consulted some one who had mastered the elementary parts of Newton's *Principia*. Probably Mr. Hay has heard of Newton, and likely enough he knows as much about him as most people who are not mathematicians are expected to know. But writers who indulge in prophetic visions on the progress of physical astronomy should contrive to know a little more. In like manner it is evident that Mr. Hay's notions of heat, electricity, and the doctrine of energy are of a very loose and confused kind. If it should seem pedantic to criticize want of scientific probability in such a work, we reply that the author is not bound to go into details at all; but, if he does, the whole merit consists in their being plausible. We must add that another quality rather important in fanciful writing is almost altogether absent from Mr. Hay's—we mean humour. The only trace of it we can find is that the professors of the twenty-second century go on, after all these tremendous revolutions in politics and science, quoting familiar tags of the Latin poets just like their nineteenth-century ancestors. This is hardly said.

(2) *Three Hundred Years Hence; or, a Voice from Posterity*. By William Dalziel Hay. London: Newman & Co. 1881.

enough to season a whole Utopia. We forgot to mention that England is extinguished as a political power at a very early stage in the story. This is in accordance with what we have observed to be the usual practice of fantastical writers in this kind, whether they pretend to be seriously interpreting prophecies or only diverting themselves with an exercise of speculation. Almost always they begin with ruining their own country, thinking this, we suppose, the best way to attract a lively attention.

Mrs. Magnus's *About the Jews since Bible Times* (2) is an entertaining and instructive work. It is curious how little is known of the large Jewish community who live amongst us. Their post-Biblical history, their literature, doctrines, and ceremonials are almost as much a mystery to the general public as the Mesopotamian mysteries themselves. Mrs. Magnus has raised the veil from these arcana, and given a very readable and popular account of most things that ought to be known about the chosen people in their later development.

The fanciful title of Mr. Grant Allen's little book (3) may give a hint to the discerning of its real character, but is hardly free from ambiguity. These collected papers are really a series of popular studies in natural history, for the purpose of showing, in a form intelligible by the unlearned, the new light and interest which have been thrown into biology by the ideas of evolution and natural selection. The style is bright and pleasant, and great skill has been exercised in avoiding technicalities. Mr. Grant Allen takes his text in the first object that may come to hand in a country ramble—an insect, a wild flower, a nut, or a snail-shell—and he leads us on, as if in familiar talk, to consider its place in the vast fabric of nature, the history of past changes embodied in its structure, and the countless relations with external things and circumstances that have made it what it is. This is done always with felicity of expression, and generally with a certain sympathy for the creatures described which is even better for the purpose in hand. Mr. Grant Allen is evidently a loving observer of animals and plants from the dog downwards. The bustle of an ant's nest sets him thinking of the ant's brains, and how the world must appear to them as made up of smells rather than of sights, "mainly a world of olfactible things." In the habits of modern sheep the instincts of their mountain-haunting ancestors are traced, and it is pointed out that the exact following of the leader, which in a flock driven through a lane or street seems ludicrous, was an absolutely necessary point of discipline for the wild troop threading a mountain track. Fruits, berries, and nuts give occasion for lively picturings of the struggle of plants against the birds which eat their seeds. The edible kernel surrounds itself with a hard shell, with prickles, with bitter or poisonous matters, with tough fibres, or with various combinations of these. Hence the tribe of nuts, proof, some of them, even against the stone-wielding monkey. Other fruit-bearing plants have found their account in the very opposite plan; they produce a hard indigestible seed, and lay themselves out, so to speak, for inviting birds to swallow it, and ultimately ensure its wider distribution. Hence the soft fruits and berries, in which generally similar results are produced by means which to the botanist's eye are of the most diverse character; thus the structure of the raspberry and the strawberry are botanically quite different. Again, the tadpoles ridding themselves of tails in a pond furnish the theme for a discourse on the earliest vertebrate type. We are almost tempted to call it a moral tale of the idle ascidian and the industrious tadpole; for the ascidian, who in the larva state is little worse than a tadpole, develops the wrong way as he grows up, and illustrates the sad truth that evolution is not necessarily progress by becoming "a mere sedentary swallower of passing morsels," "a sack fixed to a stone." The relation between the colours of flowers and their fertilization by insects is naturally not omitted by a writer who has already chosen the colour-sense in animals as the subject of a more methodical and serious work; and Mr. Grant Allen's readers will here find such an amount of ingenious illustration and suggestion as will tempt them to exclaim that here, if anywhere, are the poetry and romance of natural history. We need hardly say that Mr. Grant Allen's point of view is thoroughly Darwinian—perhaps more than Darwinian, for there is a buoyant confidence in his manner, and a fertility of conjecture in his illustrations, which are not altogether after the pattern of Mr. Darwin's own work. But the anxious accuracy of the inquirer working for permanent results is hardly to be expected in the meditations or soliloquies begotten of walks over country fields and downs. If Mr. Grant Allen's statements are open to criticism now and then, he still gives in the main an example of the right method and spirit, and will stimulate the reader's desire for knowledge of the right kind. Some of his remarks point to observations of solid value, as where he says that the reason why people used not to find so-called "missing links" was that they looked and cared for nothing but "typical specimens" of the genera and species described in books, and when they found aberrant individuals among snail-shells, for instance, threw them away. If these aberrant types are preserved it is quite possible, Mr. Grant Allen testifies from his own experience, to bridge over the gaps between distinct species. On the whole, any one who knows natural selection in the general as a theory, but has not realized its varied applications in the most familiar facts of animal and vegetable life, can hardly find a better aid to his imagination than

Mr. Grant Allen's volume; and to those who already have any taste for natural history in the concrete it may safely be recommended as a welcome holiday companion.

The second edition of Mr. Eastwick's *Handbook to Bombay* (4) has been not only revised, but to a great extent rewritten, by its author on the spot. "All the most important places in the Bombay Presidency have been recently visited by the author, and in particular the province of Káthiawár, which is very difficult of access at present to the ordinary traveller, has been thoroughly examined." The first few pages of the book contain some most valuable hints as to dress, outfit, &c. Certainly no one could guess, by the light of nature, that "at the Marble Rocks, Eldra, Ajanta, and the Nigiris," the attacks of bees are likely to be so dangerous that it is prudent to wear long Titianesque gauntlets and a veil, if not a wire mask; or that those who wish to shoot on the west coast should have gaiters steeped in tobacco juice to keep off leeches.

It is difficult, and it is perhaps unnecessary, to determine which is the better and more amusing of Mr. Burnand's two lately-republished parodies on novelists (5). *Chickin Hazard* is the older friend, and contains wilder fun; but *Gone Wrong* is equally admirable as a parody, especially in the quieter passages, and has a more serious vein of certainly not undeserved satire, which is not found in the other volumes. We cannot resist quoting one favourite passage from *Chickin Hazard*, in which Nutt looks about on the desert island for a substitute for wine:—

After a few minutes' search he came back, radiant with smiles, and bearing in his hand a flowering shrub of a most peculiar description. Its roots grew out above ground, deriving apparently its life from the various suckers which shot themselves out into the air, while its leaves and branches had spread and flourished underneath the earth, affording shelter to a variety of insects of a genus between ants and scorpions. "This will serve us, Miss Marchmont," Nutt said, "for, at all events, one sort of beverage for this evening. From it I shall distil a sweet and potent spirit, dear to sailors on board ship. It is at once invigorating, supporting, and refreshing." "Do sailors grow it in Benicia or England?" inquired Grace. "I am not aware," he answered, "that the plant itself has been much cultivated in either place, though the taste for the liquor obtains in most of our northern civilized countries. The beverage so decocted is entitled rum." "How strange!" exclaimed Miss Marchmont, as she examined the stem and leaves of Nutt's prize; "how little do we know of nature's provisions! What an extraordinary sample of vegetation!" "Yes," answered Nutt, "you have now seen the—'RUM SHRUB.'"

Just before this is Nutt's answer to Grace, which is the exact image of Mr. Reade's quasi-scientific method. "'Then,' said Grace, 'it is not impossible to set a river on fire?' 'By no means,' answered Nutt, 'provided the water will burn. But there are many contingencies which might prevent an inexperienced hand from attaining its object.'"

Lovers, and it is to be hoped they are many, of *The Original*, will welcome Mr. "Felix Summerly's" daintily got up and printed edition of *The Art of Dining* (6). There is a judicious preface, and in an appendix a reprinted letter by the editor, which contains the soundest advice as to the reformation of public dinners. It must, we fear, be wished rather than hoped that the advice will be speedily taken.

Fin-Bec is already well known as an authority on gastronomic matters, and the object of his present brightly-written volume (7) is a capital one, as may be judged from the "explanatory" statement prefixed to the book:—

He who has seen humble and sagacious people living comfortably on materials that represent something very close upon starvation to an English poor family; and who has made the dismal contrast his study, in the hope that he might presently observe upon it with profit to many thousands in these dear times; now submits some of the lighter parts of his labours to all who have a desire to know the Thrift that secures Plenty in the end, and, knowing it, to impart it to their neighbours who hunger through ignorance rather than through poverty.

Mr. Lukin (8) has undertaken an excellent piece of work in giving clear instructions for "the home construction of simple wooden toys, and of others that are moved or driven by weights, clock-work, steam, electricity, &c." It is only to be hoped that his younger pupils will not hurt themselves much in their lessons. The little book has an object beyond its immediately apparent one. "It is not," Mr. Lukin says, "for the sake of the toys themselves, but to promote the practice of carpentry, that I determined to write this book. I want the manufacture of the toy to lead up to that of the real article, be it barrow, cart, roller, or the articles of furniture of a doll's house." We shall look with interest for the completion of the work.

Lady Lamb's *Christmas Days at Maythorpe* (9) is a capital little story, the nature and calibre of which are perhaps sufficiently indicated by its title. Young readers who become acquainted with "Grannie and her bairns" will certainly hope that the hint of the author, contained in the last words of the volume, as to the reappearance of her personages may be acted upon.

(9) *Christmas Days at Maythorpe*. By Lady Lamb. London: Newnan & Co.

(2) *About the Jews since Bible Times*. By Mrs. Magnus. London: C. Kegan Paul & Co. 1881.

(3) *The Evolutionist at Large*. By Grant Allen. London: Chatto & Windus. 1881.

Mr. Snape's Reminiscences (10) are more amusing than might be thought from their title. His recollections of De Bush are both curious and instructive, and his chapter on the management of nervous patients and children seems very sensible.

Mr. Woodburne has produced an interesting little volume (11), dealing with the growth, from 1803, of the Volunteer movement in England down to the present date. He ends his work with the appropriate quotation from Pitt:—

I was formerly, and still am, of opinion that to a regular army alone, however superior, however excellent—that to the regular army alone, even aided by the Militia, we ought not solely to trust . . . we ought to superadd to the regular army some permanent system of national defence either to a certain degree compulsory, or formed upon the voluntary zeal and patriotism of the country itself.

Two volumes of pleasant gossiping reminiscences of people and things theatrical, by the late Lord William Lennox (12), have been published. The author's early recollections reach back to George Frederick Cooke, with whom he describes a meeting at Chichester when the actor was playing Shylock. In the trial scene the knife slipped and cut his hand severely (how a sharp knife came to be used we are not told), and while the wound was being dressed Lord William made his way into the actor's dressing-room. "The most prominent features of his countenance were a broad, long, hooked nose; dark eyes, full of fire and expression; a strongly-marked and flexible brow; a high forehead; a mouth capable of delineating the worst passions of our nature." His manner "was polished and refined until maddened with the invincible spirit of wine"; and the conversation which followed the introduction is a very amusing instance of some of his prominent characteristics. Later on we have a very enthusiastic description of the talents of the famous Master Betty, whose face, "when roused and livid with passion, was wonderfully expressive," while his smile was "irresistible," and "every action graceful and appropriate." His discrimination of various and contending passions was of the nicest kind, and "of the business of the stage he was a perfect master." The book is one which may be safely taken up at random, with a fair prospect of lighting upon something amusing.

We cannot, for the present at least, do more than note the appearance in *The Great Musicians* series (13) of Sir Julius Benedict's *Weber* and Mr. Frost's *Schubert*.

A fourth edition, the first volume of which has appeared, of *Conington's Virgil* (14) has been undertaken by Mr. Nettleship.

(10) *Reminiscences of a Dental Surgeon*. By Joseph Snape, L.D.S., late Dental Surgeon to the Royal Infirmary, &c. London: Simpkin & Marshall. Liverpool: Howell.

(11) *The Story of Our Volunteers*. By G. B. L. Woodburne, B.A. London: Newman & Co.

(12) *Plays, Players, and Playhouses, at Home and Abroad*. By Lord William Pitt Lennox. 2 vols. London: Hurst & Blackett.

(13) *The Great Musicians—Schubert*. By H. F. Frost. *Weber*. By Sir Julius Benedict. London: Sampson Low & Co.

(14) *Bibliotheca Classica—Conington's Virgil*.—Fourth Edition. Revised, &c., by Henry Nettleship, M.A. Vol. I. London: Whittaker, Ave Maria Lane; Bell, York Street.

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

THE UNITED STATES.

The Annual Subscription to the SATURDAY REVIEW, including postage to any part of the United States, is £1 10s. 4d., or \$7 58 gold, and may be forwarded direct to the Publisher, Mr. DAVID JONES, at the Office, 38 Southampton Street, Strand, or to Mr. B. F. STEVENS, American Agency, 4 Trafalgar Square, London. International Money Orders can be sent from any office in the United States, and Subscriptions, payable in advance, may commence at any time.

THE SATURDAY REVIEW

POLITICS, LITERATURE, SCIENCE, AND ART.

Price 6d.

CONTENTS OF No. 1,333, MAY 14, 1881:

Lord Salisbury's Election. Mr. Bradlaugh. South Africa. Vaccination. The Meaning of the French Expedition. Limitation of Actions for Debt. French Conservatism.

Premiers in Westminster Abbey. *Sature Politics*. Lord Danvers on Invasion. Mr. Froude's Ideas of Literary Trusteeship. The Last Public Declaration of Leo XIII. Trained Nephews. The Decline of the Sword. The Monetary Conference. The Opera. *Othello* at the Lyceum.

Reinhold's Popular Science Lectures. An Unlearned Girl. English Odes. Modern Wildfowling. Some Recent School Classics. An Ocean Free-Lance. Minor Notices.

CONTENTS OF No. 1,333, MAY 7, 1881:

The Conservative Party—The Irish Land Bill—Governments and their Agents Abroad—The Occupation of Bosnia—The Welsh Sunday Closing Bill—Germany—South Africa—The Law of Distress—The Small-Pox Epidemic. Young Oxford—The Innocents in Ireland—Ostriches and Crickets—Wrong-Headed Reform—The Highest Criticism—Paradise Theatre—Refounding the United States Debt—The Picture Galleries. II.—*Othello* at the Lyceum—The Spring Racing. Life of Bishop Wilberforce—Cor's Mythology and Folk-Lore—Ireland's True Daughter—Services of Canterbury—Through America—The Landau—Stevens's *Madame de Staël*—Shadows in the Sunlight—French Literature.

London: Published at 38 SOUTHAMPTON STREET, STRAND, W.C.

ADVERTISEMENTS.

DORÉ'S GREAT WORKS, "CHRIST LEAVING THE PRÆTORIUM," "CHRIST ENTERING JERUSALEM," and "MOSES BEFORE PHARAOH," each 25 by 31 feet; with "Dream of Pilate's Wife," "Christian Martyr," &c., at the DORÉ GALLERY, 35 New Bond Street. Daily, Ten to Six. 1s.

THE GROSVENOR GALLERY.

SUMMER EXHIBITION.

Now Open daily, Nine to Seven.

Admission, One Shilling. Season Tickets, Five Shillings.

PALL MALL GALLERY, 48 Pall Mall.—NOW OPEN to the Public, the EXHIBITION of PICTURES by the celebrated Russian Artist, AIVAZOVSKY. Aivazovsky's "COLUMBUS'S SHIP IN A STORM."

AIVAZOVSKY'S "COLUMBUS LANDING on the ISLAND OF SAN SALVADOR," and many other notable Paintings, at the PALL MALL GALLERY, 48 Pall Mall.—Admission, 1s. Fridays, 2s. 6d. Catalogue, 6d.

UNIVERSITY OF LONDON.—Notice is hereby given, that the next HALF-YEARLY EXAMINATION for MATRICULATION in this University will commence on Monday, June 20, 1881. In addition to the Examination at the University, Provincial Examinations will be held at Owens College, Manchester; Queen's College, Liverpool; Queen's College, Birmingham; St. Catherine's College, Ushaw; Stonyhurst College; University College, Bristol; the Yorkshire College, Leeds; the School of Science and Art, Newcastle-on-Tyne; the Literary Institute, Edinburgh; St. Benedict's College, near Laverne; and (for Ladies only) at the Ladies' College, Cheltenham. Every Candidate is required to transmit his Certificate of Age to the REGISTRAR (University of London, Burlington Gardens, London, W.) at least fourteen days before the commencement of the Examination.

April 30, 1881.

ARTHUR MILMAN, M.A., Registrar.

ROYAL AGRICULTURAL COLLEGE, OIRENCESTER.

For the Science and Practice of Agriculture. For intending Land Owners and Occupiers, Land Agents, Surveyors, Colonists, &c. The R.A.C. Farm, surrounding the College, is a mixed farm of about 500 Acres. Chairmen of Committee of Management, The Right Hon. the Earl of DUCIE.

For Prospectuses of College and Farm, List of Scholarships, Prizes, Diplomas, &c., apply to the PRINCIPAL.

OWENS COLLEGE, Manchester.—The COUNCIL, having decided to found a new PROFESSORSHIP OF APPLIED MATHEMATICS, invite applications from Gentlemen desirous of becoming Candidates. The fixed stipend is £300 per annum, in addition to two-thirds of the fees paid by Students. The appointment will date from September 29 next. Further information respecting the duties of the Professor may be obtained from the PRINCIPAL of the College. Applications and testimonials, addressed to the Council, will be received up to May 28.

J. HOLME NICHOLSON, Registrar.

BRIGHTON COLLEGE.

The Office of PRINCIPAL will become VACANT at the end of the present Term. The Council are prepared to receive applications from Gentlemen desirous of the appointment. Candidates must be Clergymen of the Church of England, in Priest's orders, of the degree of Master of Arts at least of one of the Universities of Oxford or Cambridge. Every information may be obtained of the SECRETARY, the College, Brighton, to whom Testimonials must be sent on or before Thursday, June 9.

MARLBOROUGH COLLEGE, February 1881.—TWELVE

SCHOLARSHIPS, varying in value from £20 to £15 a year, besides a certain number of FREE ADMISSIONS, will be competed for in June next. These Scholarships are open to members of the School and others without distinction; two will be offered for proficiency in Mathematics. Age of Candidates from Twelve to Sixteen. Full particulars may be obtained on application to Mr. SELLICK, the College, Marlborough. A New Edition of the COLLEGE REGISTER is now ready, to be had of Mr. SELLICK, post free, 2s. 6d.

CHELTEMHAM COLLEGE.—TWELVE SCHOLARSHIPS.

Eight £40, Four £20. Election, third Tuesday in May.—Apply to the SECRETARY, The College, Cheltenham.

FETTES COLLEGE, EDINBURGH.—EIGHT OPEN

SCHOLARSHIPS. Two of £20, Two of £10, Two of £5, Two of £3. Examination in July. Candidates residing in England may be examined in London.—For particulars apply to HEAD-MASTER, Fettes College, Edinburgh.

ROSSALL SCHOOL.—ENTRANCE SCHOLARSHIPS.

Twelve to be competed for, June 28. Value from 70 Guineas (covering School Fees) to £20. Ages under 14 and 16. Candidates may be examined at Rossall or Oxford, as preferred, in Classics or Mathematics.—Apply to Rev. the HEAD-MASTER, Rossall School, Fleetwood.

ST. EDMUND'S COLLEGE, SALISBURY.—A HIGH-

CLASS SCHOOL for SONS OF GENTLEMEN. The religious training is upon definite Church principles. Boys are Educated with much care and thoroughness. They receive individual teaching and help wherever needed. Candidates for Matriculation at the Universities are specially prepared. Terms, £75 a year.—For references, prospectus, or any further particulars, apply to the Warden, Rev. G. H. BOURNE, D.C.L.

TRINITY COLLEGE SCHOOL, STRATFORD-ON-AVON.

The Warden, RICHARD CURRY, M.A., is assisted by Seven Resident Graduate Masters, two being specially for Modern Languages. Special preparation for the Universities, Army, and all competitive Examinations. Exhibition to the University of £20 per annum. Junior Department for Young Boys. Large Playing Fields, Gymnasium, &c. &c. Terms 10 and 60 Guineas.—Apply to the WARDEN.

S. ANDREW'S COLLEGE, CHARDSTOCK, Dorset.

NEXT TERM begins May 12.—Apply to the SECRETARY.

REV. A. H. QUICK, formerly Assistant-Master at Harrow, takes into his house BOYS who have not before been to a Boarding School, and who are intended for the Public Schools.—Address, Hill House, Guildford.

TORQUAY.—A OLERGYMAN is desirous of READING

with Candidates for Holy Orders, or for Matriculation at the Universities. Lonely situation, close to sea. Terms, 1 Guinea a week, inclusive of all Board, Lodging, and Station.—Address, Rev. A. B. C. Westley's Library, Torquay.

CARSHALTON HOUSE SCHOOL, Surrey.—BOYS carefully

prepared for Civil and Military Examinations.

EDUCATION.—GERMANY, BONN—on the Rhine, 37 Baum-

schuler Allee.—The Prussian KUNDE receive a limited number of YOUNG LADIES. Some quarters, best maps, unexceptionable references.—For particulars apply to the above.

Price 6d.

THE SECOND READING OF THE LAND BILL.

MR. GLADSTONE'S speech on Monday—which, rather than the foregone conclusion of the second reading, was, in connexion with the Land Bill, the event of the week—was in many ways a remarkable performance. In the first place, the intervention of the PRIME MINISTER at that particular stage of the debate was an unmistakable confession that matters were not going smoothly. There could have been no reason, in the ordinary course of things, why at that particular juncture the Government should come to the conclusion *ventum est ad triarios*. Several members of the Treasury bench had not, and have not yet, spoken on the subject; and, for the special purpose of resolving the doubts and settling the hesitations of the inquiring, the Solicitor-General for IRELAND might have seemed to be in a better position than the head of the Government. The substitution of the persons can only be accounted for either by the supposition that a sense of discouragement, necessitating the exhibition of a cordial, had been noticed on the Government side of the House, or else that Ministers had made up their minds not to give any definite answer to the doubts which Mr. GIBSON and Mr. SMITH and other Opposition speakers had formulated, but to carry the matter off with a display of oratorical fireworks. It was, of course, possible when Mr. GLADSTONE rose that he was going to give an example of that masterly elucidation of a complicated and difficult subject, in which, by the consent of friends and foes, he has, and for many years has had, no rival. But such a display would have been so much more in place at the close of the debate, and its effect would have been so much greater, that it could hardly be doubted that it would have been reserved for that occasion.

The result justified the anticipations formed when Mr. GLADSTONE rose. His speech was a brilliant one and full of power, but its power was rhetorical and hortatory, not argumentative or dealing with exposition. The regret expressed for Lord BEACONFIELD'S death, and its results, as shown in the attitude of the Opposition, the suggestion that the rejection of the Bill would only lead to the production of a more sweeping measure of the same kind, and the other strong parts of the speaker's deliverance, left explanation entirely out of the question. The contention that the Bill can at best be but a palliative, and a palliative the expiry of whose effects will almost certainly be followed by a severe relapse in the patient, was ignored. Even the specified points on which speaker after speaker had asked for information were for the most part passed over. In particular Mr. GLADSTONE did not so much as attempt to defend the monstrous proposition that tenant-right, after being bought up, should revive again as against the landlord in a tenant who had paid nothing for it. His old grasp of details seemed to have deserted him, or to be deliberately discarded. The only disputed point to which he really devoted himself was, it is true, the most important point of all. It has been pointed out from the beginning that the maximum of injustice and unwisdom where many things are unjust and unwise lies in the provisions for the settlement of fair rent by the valuation of tenant-right. Again and again it has been asked where this value was to come from except out of the landlord's pocket, and whether it could be called fair that it should so come. Mr. FORSTER, with not uncustomary indignation, stated

plumply that it would not be fair, and referred the question of origin to the Attorney-General for IRELAND. The Attorney-General for IRELAND, after much reflection, delivered a speech which left friends and foes as much in the dark as to this question of origin as they were before. It was therefore left for Mr. GLADSTONE to solve the mystery. That he solved it would be too much to say, but he certainly lifted a corner of the veil, and, in so doing, he indicated to the opponents of the Bill the place on which they must in Committee make their assault. According to Mr. GLADSTONE, the elements of that tenant's property in his holding which he denied in 1870 and asserts in 1881 are two. There is first the value of his own improvements. On this point there is not much controversy, and whatever abstract objections there may be may be passed over. But the second element, when it is considered, exhibits in the clearest possible light the weakness of the Bill, and the certain source of future evil which it opens up. The second element of the value of tenant-right is, in Mr. GLADSTONE'S words, "the excess of open biddings for holdings in Ireland, in consequence of the scarcity of the supply of land as compared with the demand." This excess, according to the PRIME MINISTER, no more belongs to the landlord than the tenant's improvements do. It is to this statement, and to the consequences drawn from it, that attention may be most profitably devoted. In the first place, it must be evident that competition value being thus exploded, no power on earth can determine what fair value is. If the value of a thing is not what it will fetch, what in the name of arithmetic and common sense is it? How is Mr. GLADSTONE going to define the proper adjustment of demand to supply so that he may gauge the excess of the one and the scarcity of the other? To those questions not one fraction of an answer, not so much as a hint at one, is to be found in the whole speech. Obviously if the population of Ireland were half what it is now, the demand for land would be less; if it were double, it would be more. How is any Commissioner or any accountant to put his finger on the normal value, independent of these fluctuations, and to establish it *in secula seculorum* as a land maximum? But the impossibility of arriving at the end aimed at, and the injustice done to those whose property is thus arbitrarily apportioned, are perhaps, from a political point of view, hardly equal to the intense folly and unwisdom of the proceeding. The competition value of land is, says Mr. GLADSTONE, excessive, because of the unequal relation of supply and demand. How is he going to prevent the future operation of the same law? If the present tenant unduly outbids his competitors in rent for the benefit of his landlord, because of the stress of this competition, is it not inevitable that the future tenant should in the same way outbid his competitors in the purchase of tenant-right for the benefit of the lucky occupier? It is said, though not explicitly, or in the words of the Bill, that this payment is to be limited. Anything more pitiable than the expectation of being able to do this in statesmen who doubtless consider usury laws childish folly, who believe in Free-trade, who look back on sumptuary regulations and legal maxima of price as the freaks of barbarism, can hardly be imagined. That in the case of any such attempt being made a regulation price and an over-regulation price for tenant-right would become the rule, and that the over-regulation price would be ruled only by the

attained, is as certain as that night follows day. Even Mr. GLADSTONE cannot doubt the acres of waste land into cultivation and induce the people to migrate, and, though there may be dispute as to the best means of effecting these objects, no one in England disputes their excellence. But to meet the irresistible laws of nature by an Act of Parliament and a court of three Heaven-born Commissioners is certainly as bold an enterprise of the Mrs. PARTINGTON order as has been entered upon for some time.

All this, of course, has been said over and over again before; it will be said over and over again; and it is not surprising that, as far as the second reading went, it had very little effect on a dutiful majority and a Parliament confronted with the absolute necessity of reaping and garnering somehow the corn which the Government have sowed. What is important is that no attempt has been made to meet these objections in what must be considered the last word of the Government in general defence of their Bill. The Government speakers could only busy themselves with details when Mr. GLADSTONE had made his final effort on the principles and general scope of the Bill. In the same way, it was almost useless for Opposition speakers to repeat general objections which were steadily ignored. The duty of an Opposition in cases where absolute rejection of a measure is impossible and, what is more, dangerous if possible, is a matter very hard to define within narrow limits. Probably, when argumentative concessions are made and full explanation vouchsafed, it is their duty to abstain from a direct negative or from the support of an amendment. That case is not the case of the present Bill; and although the formal wording of the amendment which the Opposition supported might doubtless have been improved, the very moderate speech which Colonel STANLEY made some days ago sufficiently vindicated a certain right of protest which could not be upheld in any other way than by resorting to the division lobby. This contention, which had already been thus sufficiently made good, Sir STAFFORD NORTHCOLE stated and finally established in the little duel between himself and Lord HARBINGTON which concluded, or virtually concluded, the debate. This duel, as well as the speeches of Mr. CHAPLIN against, and of Mr. STANSFELD in favour of, the Bill, relieved the monotony of the closing night, but it did little more. The battle, as far as it can be fought at all, remains to be fought, and the weary discussions on the second reading have, for the most part, only succeeded in indicating with more or less precision the locality and conditions of the fight. The minute explanations which the Government have hitherto avoided must be explicitly given or explicitly refused sooner or later; and each separate proposition of their enormous scheme will have to be considered separately.

RUSSIA.

IT is difficult to obtain trustworthy information as to either the domestic or the foreign policy of Russia; but there is no inconsistency between the reported project of a Land Bill and the remarkable document which justifies and exalts the autocratic power of the EMPEROR. One of the numerous objections to absolute government is founded on its tendency to prefer the wishes of the mass of the population to the interests and rights of less formidable classes. Successive Emperors of Russia have always sought to depress the nobility and to cultivate the affections of the peasantry. ALEXANDER II. may probably have been influenced by patriotic and benevolent motives in his agrarian reform; but he also hoped to attach the mass of the people to the Crown by his gifts of personal freedom and of proprietary interest in the land. If the present EMPEROR has resolved to extend the privileges of the peasantry, and to relieve them from some of their pecuniary liabilities, he probably hopes for the gratitude of those who will profit by the change; and he may perhaps regard with indifference worthy of an English Radical the corresponding sacrifices which will be entailed on the landlords. It would be rash to form a confident judgment of the necessity or expediency of the proposed agrarian reforms. If they have any political purpose, they are probably designed to strengthen the Crown rather than the classes which aspire to political privileges. The late or present advisers of the EMPEROR may perhaps be

divided in opinion as to the merits of the supposed scheme; but there is no reason to believe that any of them have met with direct opposition. The maintenance of the prerogative might probably be regarded as indispensable to the success of such a measure. There is great convenience in total exemption from clauses, from Committees, and from possibly hostile amendments.

The proclamation in which the EMPEROR affirms the divine right of autocracy is apparently intended to put an end to all discussion of constitutional innovations. If the EMPEROR has really formed an irrevocable decision, it may perhaps have been politic to announce it without delay. Prolonged and repeated disappointment is more irritating than compulsory acquiescence in a refusal expressed once for all. Agitation for any kind of representative organisation will henceforth involve a defiance of the will of the EMPEROR. The proclamation may perhaps be intended as an answer to a recent challenge issued by the Nihilists. Their governing body published a kind of ultimatum, to the effect that, if their efforts were to be suspended, the EMPEROR must convocate an Assembly elected by universal suffrage, and abide by its resolutions. Concession of the demand would have been impossible, but perhaps some compromise might have been devised. A consultative Council might have satisfied some malcontents, though it would assuredly not have disarmed the murderous fanatics. The only ostensible approach to a constitutional system was the establishment of a Ministry, which was to enjoy, to a limited extent, corporate existence; but it is now certain that no real change has been effected. According to a late report, the EMPEROR has formed an interior Cabinet of those Ministers who specially enjoy his favour; and he will scarcely allow the members of the confidential body to assume collective independence. In Germany the several Ministers depend directly on the EMPEROR, and they exercise little influence on the policy of the imperious chief of the Government. Even in England the establishment of a united Ministry under an official head was only effected after many checks and interruptions in the course of the last century. The modern practice has diminished the personal power of the sovereign more effectually than any other constitutional process. In a political crisis the Crown is confined to the choice between two sets of advisors, or rather to the leaders of the majority. It is now known that Count MEUKOW and his colleagues resigned because the autocratic proclamation, composed by Mr. KATKOFF, had been issued by a subordinate member of the Government. It was clear that the supposed unity of the Cabinet had not been seriously accepted by the EMPEROR.

The creation of any more popular Council or Assembly is indefinitely postponed. The EMPEROR has been rudely reminded of the danger which he incurs by representing himself as personally and exclusively responsible for all results of misgovernment. He has apparently convinced himself that he would risk the security of his power by dividing it; and perhaps he may be right in thinking that no reasonable concession would disarm the assassins. The attendant circumstances were striking, for the proclamation was published at the same time at which there was a grand review of 40,000 men forming the garrison of St. Petersburg. It seemed that the display was intended to convince friends and enemies of the irresistible force of the Government which boldly claimed absolute power. One newspaper Correspondent had, almost on the eve of the review, attributed to the EMPEROR a feeling of panic which induced him to remain in solitude at his palace of Gatschina. His nerves were supposed to be shaken not only in consequence of the late events, and of the dangers which remain, but through sympathy with the PRESS, who is exorbitantly oppressed with terror. The appearance of the EMPEROR in public at the head of a formidable army seems inconsistent with the charge of timidity. He appears to have been well received by the crowd, nor is there any reason to doubt that the mass of the people is loyal. The peasants want no Constitution, though they may have grievances and imagined remedies of their own. The great bulk of the upper classes is averse to disorder, and it is supposed that the disaffected part of the community is scanty in number and insignificant in social position. Students from the Universities, with a smattering of knowledge and with scanty means of subsistence, probably furnish the Nihilists with the majority of their recruits. From the same quarters proceed the demands for a Constitution, which would probably become

practically imperative if it were formally established. In differences between the Sovereign and an independent Legislature, moral and physical force would be on the side of the Emperor. The peasants have no traditional reverence for a Parliament, and opposition would in their judgment be indistinguishable from rebellion. It is less surprising that the Emperor should retain his absolute power than that he should publicly announce his resolution to maintain it.

In such a Government as that of Russia, the selection of persons is more significant than any declaration of principles. The dismissal or retirement of Count MURKOFF, of General MILUTIN, and of M. DE GIENS will be thought to indicate a policy of repression at home, if not of foreign adventure. General IGNATIEFF is reported to be a supporter of despotic modes of administration, and his name is more definitely connected with a turbulent and insidious foreign policy. It was supposed that he forfeited the favour of ALEXANDER II. by the part which he took in precipitating the war with Turkey, and alarmists will, perhaps, suspect that he may now be inclined to the desperate experiment of diverting attention from domestic troubles to external schemes of aggression. It is probably by an accident that his promotion coincides in time with the doubtful reports of an intended mission from Tashkend to Cabul, and of a commercial alliance between Russia and Afghanistan. It would nevertheless be injudicious to assume that the appointment of General IGNATIEFF implies a disposition on the part of the Emperor to disturb the general peace. If the Ministerial changes are accurately reported, they would seem to involve a reaction against German influence, which was supposed during the life of ALEXANDER II. to be highly distasteful to his son. It is nevertheless surmised that the relations of the Russian Court with Berlin are more cordial than at any former time; and the policy of the new Emperor is confidently attributed to the instigation of Prince BISMARCK. German opinion, as far as it can be collected from the newspapers, is almost unanimously adverse to Russian reaction; but it is of course possible that Prince BISMARCK may have reasons for discouraging Liberal concessions. His own attachment to Parliamentary institutions has never been cordial; and he may perhaps apprehend that they would be more difficult to manage at St. Petersburg than at Berlin. It must be remembered that the supposed interference of the German Government in Russian affairs is entirely conjectural. It is also possible that ALEXANDER III. may still be hesitating between two opposite systems; but, on the whole, a resolute adherence to the absolute government which he calls autocracy may plausibly seem to be the more prudent course. But for the Nihilists, there would perhaps be no audible demand for change; and it is hopeless to conciliate implacable enemies. Although the extreme revolutionary faction has sometimes been thought to favour schemes of Slavonic aggrandizement, its leaders are not likely to have had any connexion with General IGNATIEFF. The former Ambassador at Constantinople was an efficient promoter of the war, for which he had long prepared; but he is not generally regarded as an enthusiast. The Emperor, who supported the same policy before and during the war, may perhaps have been impressed by General IGNATIEFF's ability, and may have believed that the same energy and sagacity would be useful in the solution of domestic difficulties. It was not known whether the War Minister suggested or improved the autocratic proclamation.

A MINISTER OF AGRICULTURE.

PRIVATE members who in the present Session succeed in getting a hearing for their Bills or Resolutions are fortunate in the opportunity of diverting the attention of the House from wearisome debates on Ireland. As in private society dull discourse on commonplace topics sometimes affords a relief from the more painful discussion of personal disputes or domestic difficulties, the hackneyed demand for a new Ministerial department was perhaps welcomed because it had nothing to do with freedom of sale or fixity of tenure. Sir MASSEY LOPES is one of the few independent members who has on one occasion defeated a hostile Government commanding a large majority. Seven or eight years ago he carried a motion, which has since produced perceptible results, for the reduction of land burdens. His proposal that there should be a Min-

ister of Agriculture and Commerce was least interesting to any special class; but it was well calculated to attract votes; and it was, in the end, carried without a division. A similar, but not identical, motion introduced by Mr. SAMPSON LLOYD was rejected by the last Parliament. There have at different times been several attempts to elevate the importance of particular branches of administration by giving them representatives in the Cabinet. It may be plausibly argued that a Minister would have fuller employment in representing either education or commerce than in disposing of the patronage of the Duchy of Lancaster or in taking care of the Privy Seal; but experience shows that it is scarcely practicable to increase the number of great departments of State, and that there is no inconvenience in readjusting from time to time the distribution of their functions. At one time the President of the Poor Law Board became a Cabinet Minister; and another great functionary was charged with the superintendence of railways. The execution of the Public Health Acts, which has sometimes been entrusted to the Home Office, now belongs to the Local Government Board, which also administers the Poor-laws. Factories, fisheries, and several other subject-matters have, after full deliberation, been retained by the Home Secretary; while the prevention of contagious disease among animals is included, together with the superintendence of elementary education, among the duties of the President and Vice-President of the Privy Council.

Agriculture, notwithstanding the depression which has after a long interval resulted from the repeal of the Corn-laws, is still the most important interest in the country; but Sir MASSEY LOPES's inference that it needs official aid and supervision is not obviously sound. The proper business of a Minister is to conduct the business of his department; and in recent times the secondary duty of introducing suitable legislation has acquired undue importance in popular estimation. It is not easy to understand what a Minister of Agriculture could do to help farmers in the conduct of their business; and in the ordinary course of affairs they want no new Acts of Parliament. Ambitious projects of alterations in land tenure, or Irish Land Acts imported, as Mr. ILLINGWORTH threatens, into Great Britain, will be undertaken, if at all, not by a single Minister, but by a Cabinet executing the mandate of a political party. It may be assumed that Sir MASSEY LOPES is not anxious to facilitate measures for breaking up landed estates, or for transferring to tenants a share in the property of their landlords. Neither Mr. GLADSTONE nor Mr. FORSTER is Minister for Agriculture in Ireland. Some landowners look with more favour on imaginary schemes for restoring Protection under cover of retributive duties on imports. Any measure of the kind will be impossible until the ownership of land has been largely subdivided; and, even if anti-economic legislation were contemplated, reciprocity must have been approved by the Cabinet and the Parliamentary majority of the day. The only executive function which Sir MASSEY LOPES and his supporters could devise for the new Minister was the collection and publication of agricultural statistics. The compilation of tables of figures, if it is required, must be the work of clerks and accountants. One of the speakers in the debate asserted that the Agricultural Bureau in the United States is likely to be suppressed as costly and useless. In any case, it is not the business of a Minister of State to collect statistics, though he may sometimes quote or otherwise use them.

To the Ministry of Agriculture was to be annexed the larger function of assisting or regulating commerce. The obvious answer to the proposal is that there is already a President of the Board of Trade, with a Parliamentary Secretary and a full permanent staff. The confusion which is produced in some minds by the most transparent fictions was curiously illustrated in the complaint that the Board never met; and that its meetings, if they were held, would be highly anomalous, inasmuch as one of its members is the Lord Chancellor, and another is the Speaker of the House of Commons. Mr. GLADSTONE added the information, which probably no other member could have supplied, that the Archbishop of Canterbury is also one of Mr. CHAMBERLAIN's colleagues or subordinates. The Liberation Society will do well to inquire whether the recent depression of trade may not be explained by the malignant influence of an Erastian prelate. It seems not to have occurred to the administrative reformers that, if the Speaker, the Archbishop, and the rest do no good, the

publication of their names in the Red-Book also does no harm. The President of the Board of Trade would derive no advantage from a change in his title, or from the abolition of his titular colleagues. He engrosses all the powers of the theoretical Board; and yet his office is not overburdened with work. Mr. BRIGHT contrived to make the Presidency almost a sinecure; and it is not known that any serious inconvenience resulted from his distaste for administrative labour. In the great majority of Government offices the business, though it may be important, is necessarily conducted by routine. Among the duties of the Board of Trade is the investigation of the causes and circumstances of railway accidents; but the Minister at the head of the department can in such matters exercise no direct action. One of the proper officers is deputed to conduct the inquiry; and his report is necessarily accepted as the expression of the judgment of the Board. Numerous Acts of Parliament require the approval of the Board before public works of various kinds are set in operation; but in all such cases, it is an official engineer, and not a Minister, who forms the decision. The Secretaries of State also depend in ordinary matters of permanent Under-Secretaries and clerks; but they are often required to exercise a judgment of their own. No change of title would make the functions of the Board of Trade equally responsible and arduous.

In answering Sir MASSEY LOPES, Mr. GLADSTONE displayed his unequalled familiarity with all branches of administration. Although he allowed the motion to pass, he clearly proved that it was wholly unnecessary. It was right that he should call attention to Sir MASSEY LOPES's prudent omission of the proposal that the Minister of Agriculture and Commerce should have a seat in the Cabinet. As Mr. GLADSTONE remarked, it is not proper that Parliament should interfere with the constitution of a body which, though it exercises paramount power, is not even recognized by law. The provision would have been superfluous as well as irregular, for a Minister invested with higher functions than those of the President of the Board of Trade would certainly occupy a seat in the Cabinet. Mr. GLADSTONE's analysis of the complicated relations of the Government with trade showed that the existing arrangements have been carefully considered, and that the actual distribution of duties approximately coincides with the public convenience. The negotiation of treaties of commerce, which may possibly become obsolete, is conducted by the Foreign Office, which is as accessible as the Board of Trade to manufacturers and merchants. The superintendence of the foreign cattle trade and the enforcement of the factory laws could at any time be transferred, if the change were deemed advisable, to the Board of Trade, as easily as if the President had been decorated with a higher title. The delay and probable failure of the French commercial treaty cannot be attributed to any want of power on the part of the Board. One of the latest changes in Ministerial titles was the elevation of the President of the Board of Control to the rank of Secretary of State; but after the transfer of the Government of India to the Crown there was no Company to control; and it was convenient to dispense with the services of the inferior members of the Board. It may be conjectured that Mr. GLADSTONE will be in no hurry to make a useless change; but, if the President should be exalted to a higher rank, and relieved from the possible presence of the Archbishop and the Speaker, there is no reason to suppose that there could be any change in the conduct of business. The principal use of the motion was to divert the thoughts of the House for a time from Ireland.

THE FRENCH IN TUNIS.

THE operative clauses of the treaty forced at the sword's point by a French General on the Bey of Tunis are preceded by an exposition of the reasons which have prompted the action of France. There are two objects which the Government of the Republic has in view. It wishes to prevent the continuation of disorders on the frontiers, and it wishes to draw closer its relations with the Government of the Regency. The former object is attained by articles which provide that every facility shall be given for assuring the security of the shores and frontiers of Tunis by an occupation, the extent and conditions of which are left for future settlement, but which is to cease when the authorities of the Bey have shown that

they can ensure the security of the frontiers. A war contribution is to be levied on the frontier tribes, and the Bey undertakes to prohibit the importation of powder and arms in his dominions. The relations of France with the Bey are drawn closer by articles which provide that France guarantees the Bey against all external aggression; that France will see to the execution of all existing treaties; that the Bey shall not make any further treaties except with the permission of France; that France shall be represented by a Minister Resident, who is charged with the duty of seeing that the provisions of the treaty are carried out; that the two Governments will jointly arrange the terms of the settlement of the public debt, and of the claims of creditors; and that the diplomatic agents of France shall represent Tunisian subjects abroad. It is obvious that under this treaty a singularly wide interpretation is put upon the statements previously made as to the intentions of France. The expedition was said to be made with the object of punishing the Kroumirs, and obtaining from the Bey guarantees for the equitable treatment of French interests. The punishment of the Kroumirs suddenly becomes the occupation of any portions of Tunis which France may please to select. And this occupation is to be as permanent as France pleases. It is to last until the authorities of the Bey have shown that they suffice to protect the French frontier. They can never show this unless France wishes it to be shown, for they can do nothing except what they are ordered to do, and France will never be sure that they would do without orders what they do with orders. The guarantees to be given by the Bey have attained still more unexpected proportions. The Bey does not give guarantees, but effaces himself so that France may stand in his stead. France is to carry out his existing treaties, and to make his future treaties for him. France is to arrange his finance, and to keep a Minister Resident to watch over him; and, above all, France is to represent Tunisians abroad. For all external purposes Tunis is merged in France. There is no pretence of leaving the Bey as an independent sovereign. Outside Tunis he has ceased to exist. Inside Tunis he is a dependent, with a permanent director, whose directions he is exclusively to obey. The step now taken by France may or may not be justifiable on its own merits; but it cannot possibly be made to square with the declarations of the French Government at the beginning of the expedition.

This is the treaty which the Bey has been made to sign. He had previously received positive orders from the Porte not to sign anything; but when a French General came, and gave him four hours in which to make up his mind, he signed the document put before him without, as he says, even reading it. If he had not signed, the French troops would have entered Tunis, and a collision between the invaders and the population was inevitable. It was entirely to avoid the calamities to his people which must have ensued that he signed, and it was almost immaterial to him what he signed, so long as his people were spared the misery of an unavailing conflict. He then telegraphed to the Porte that he had signed under duress, and he left it to the Porte to get the treaty rescinded if it could. As the Porte had no means of openly opposing France, it could only make a diplomatic appeal to the Powers, asking them to intervene between it and France in defence of its just claims on Tunis. This appeal has met with no response. The Powers do not consider the relations of Tunis and the Porte to concern them. France has always denied the right of the Porte to treat Tunis as a part of the Turkish Empire, and the other Powers have no reason to extend the range of the difficulties which Turkey is perpetually creating. The Circular of the Porte sets out only the facts that make for Turkey, and omits all notice of the facts that point the other way. It can convince no one who is not convinced already. And, if France could honestly deny the claims of the Porte, she had very urgent motives for terminating, once for all, the intrusion of the Porte into the affairs of Tunis. The Yellow-Book published by the French Government, although it by no means substantiates all the assertions of M. ST-HILAIRE, shows that the danger to Algeria from the Tunisian Arabs was not at all an imaginary one; that the connexion between the Bey and the Porte increased this danger; and that the Bey grew less complaisant to the French in proportion as he thought

that, whatever he might do, he would be protected by the Porte, and that the Porte would be protected by Europe. It is perhaps too much to say that it was a political necessity for France to terminate the connexion of Tunis with the Porte, but there were very strong considerations of expediency to urge France to assert definitely her long-standing contention that the Porte had no claim on Tunis.

The annexation or protectorate or perpetual occupation of Tunis, whichever it is to be called, concerns, however, other Powers besides the Porte, and would concern them equally if the Porte had no pretensions to consider the BEY as a vassal. It concerns England slightly, and Italy very much. The English Government appears to have inquired whether it was the intention of France to turn Biserta into a great naval arsenal, and the reply given was, not that France was not going to occupy Biserta permanently, or that she was under any obligation not to make any use of Biserta it might think proper, but that the conversion of Biserta into a great naval arsenal would cost an enormous sum of money, which France was not at present prepared to lay out. The result is that France will make Biserta a naval stronghold if she pleases, but not until she pleases. Whether the possession of a naval stronghold at Biserta would be a source of strength or weakness to France in a war with England is extremely doubtful. To have a naval stronghold from which its possessor would be entirely cut off if the command of the open sea was lost seems a very uncertain gain. At any rate, the danger to England is so problematical that we could not possibly make it a ground of present quarrel. Lord SALISBURY long ago intimated to the French Government that he saw no English interests in the way of a French protectorate of Tunis, if ever the time should come for one; and Lord GRANVILLE merely said that England could not pretend to deal in any way with a country that did not belong to her. The bearing of the treaty on Italy is very different; and both Lord SALISBURY and Lord GRANVILLE plainly intimated to France that Italy must be taken into account, and that it did not in any way follow because England had no special interest in Tunis that Italy had none. The occupation of Biserta in force is a direct and permanent menace to Sicily, and the treaty has avowedly been made almost as much in opposition to Italy as in opposition to the Porte. When the French allege that their security in Algeria is menaced by the existence of a hostile Government at Tunis, they mean that the danger consists in this hostile Government acting partly under the directions of the Porte and partly under the directions of Italy. There is no attempt made in the French Yellow-Book to show that Italy has intrigued with the Arab population of Tunis; but there is a very elaborate attempt made to show that the BEY has resorted to subterfuges in order to favour Italians as against Frenchmen, and has broken promises made to the French CONSUL when he asked that justice should be done to those whom he represented. It is impossible to say whether the charges made are ill or well founded, as the French CONSUL naturally tells the story entirely in his own way. But, whether the French have any solid justification or not, they have incontestably forced on the BEY a treaty which is specially directed against Italy, and they have done this in the face of assurances given through England to Italy that what they were going to do was something very different. The Italians see this, and resent it, but have to put up with it, and content themselves with the feeble solace of once more changing their Prime Minister. All Frenchmen of all parties seem highly pleased with what has been done, unless the idle demonstration of the Right in the Senate is to be taken as an indication of disapproval, and it might be supposed that Frenchmen knew their own business best. But even outsiders, who are as willing to take as indulgent a view of the conduct of France as possible, cannot shake off a doubt whether France has been really wise in taking proceedings of the most high-handed and arbitrary character against a feeble sovereign like the BEY, under the humiliating cover of Prince BISMARCK's sanction, and at the cost of alienating Italy.

TURKEY AND GREECE.

THE prospects of South-Eastern Europe are once more clouding over. The Turkish Government, relying on the favourable impression which it has produced by diplomatic moderation, has of late more than once roused

suspicion by its hesitation in evacuating the territory which is nominally surrendered to Greece. From time to time fresh conditions, some of them apparently reasonable, are tendered for the approval of the mediating Powers, and it is doubtful whether simultaneous and inadmissible stipulations are seriously proposed. It is just that the property of the Mahometan inhabitants of Thessaly should be protected; but the demand that they should be exempt from military service as long as the Christian subjects of the SULTAN are not enrolled in the Turkish army can only have been preferred either for the purpose of being withdrawn or in the certainty that it would be rejected. It is in accordance with Turkish policy, and not for the benefit of the Christian population, that the dominant race has hitherto been exclusively subject to conscription. The inhabitants of Thessaly must for all purposes become Greek subjects, and, on the other hand, the Greeks will not be deprived of the benefit of the capitulations. These conditions have been withdrawn as suddenly as they were proposed; and it may, therefore, be inferred that they were intended only to serve the purpose of delay. The Vakouf lands, or ecclesiastical properties, are likely to furnish materials for endless dispute, if there is no genuine intention of arriving at a peaceable settlement. The difficulties which have been raised as to the mode of accomplishing the transfer are still more urgent. It is said that the Turkish Government contends for a limitation of the number of troops which are to occupy the ceded province. A body of ten thousand men would, it is urged, be a sufficient garrison in the first instance, while the neighbourhood of an insignificant force would cause no anxiety for the security of Epirus. If it is true that the Turks are constructing earthworks and other defences on the line of the present frontier, the Greeks have abundant ground for suspicion and distrust. A small army of occupation might perhaps find itself confronted with bands of local malcontents, for whose repugnance to the cession the Turkish Government would disclaim responsibility. Protests against annexation on the part of the Wallachian inhabitants of Thessaly are, with much plausibility, attributed to instigations proceeding from Constantinople. One probable explanation of the present uncertainty is that the SULTAN and his advisers are wavering between two opposite systems of policy. They may wish to render the negotiations abortive, and at the same time they may desire to throw upon their adversaries the responsibility of a rupture.

It is not unlikely that similar calculations may prevail at Athens. The advocates of war have perhaps by this time satisfied themselves that Mr. COUMOUNDOUROU judged wisely when he declined to place himself in direct opposition to the counsels of the European Powers. Having now established a claim to favourable consideration, the Greek Government may hope for countenance, if not for support, in meeting the unfriendly demonstrations of Turkey more than half way. It will certainly listen to no proposal for interference with its own discretion as to the strength of the army which will be sent to occupy Thessaly. Even if the Greeks were disposed to submit to the dictation of their adversaries, they would obviously commit a mistake in not employing a force large enough to repress any attempt at resistance. It is at the same time possible that the fears expressed by the Turks may not be unfounded, and that, after taking possession of Thessaly, the Greek Government will, on some pretence of a quarrel, proceed to invade Epirus. The confidence which was lately felt at Athens of the ability of the Greek army to drive the Turks out of both provinces would be greatly strengthened by the unopposed accomplishment of half the task. It may have been observed that Mr. COUMOUNDOUROU has consistently abstained from undertaking, on the cession of Thessaly, to give the Porte a receipt in full. The claim to an interest in Epirus was intentionally kept open, by the assertion of a questionable right to protect Turkish subjects of Greek language and religion even beyond the frontier. No such pretension can be founded on reasons derived from international law, which indeed has not yet embodied in its code the newfangled doctrine of ethnological sympathy. A protectorate over subjects of a neighbouring Power leads to incessant disputes, and it may have been for the express purpose of facilitating a rupture that the Greek demand was propounded. Nothing would be easier than to complain that injustice had been done to Greeks in Epirus, if

an army of 50,000 or 60,000 men were stationed in Thessaly, ready to cross the frontier. On the whole, either party is probably justified in distrusting the good faith and the peaceful intentions of the other. It may be inferred that there is a strong probability, either of a deliberate declaration of war or of a collision which would produce the same result.

Some extraneous circumstances may tend to revive the warlike disposition of the Greeks, if it had subsided. The unexpected denunciation of the Bulgarian Constitution by the PRINCE may perhaps be sufficiently explained by his experience of the impracticable nature of the democratic organization; but in Eastern States a simple explanation of political events is, perhaps with some reason, distrusted. As PRINCE ALEXANDER has recently visited the capitals of the sovereigns on whose patronage he depends, it is naturally assumed that his appeal to his subjects has been suggested at St. Petersburg or at Berlin. If his measures should tend to reopen the Eastern question, the Greeks will desire to be, as it were, on the spot, that they may take part in the next readjustment of territory. A Bulgarian revolution, even if it had no external cause or consequence, could not fail to add to the embarrassments of the Porte. The war party at Athens will derive further encouragement from the triumph of the turbulent and reactionary party in the Ministerial intrigues of St. Petersburg. General IGNATIEFF was the principal instrument in the long-sustained plot which ultimately produced the Russian invasion of Turkey. He may now probably have enough to do at home; but sanguine Greeks will rely on the hostility to Turkey which may be reasonably attributed to the confidential adviser of the unfortunate ABDUL AZIZ. A still stronger impulse to warlike policy will have been furnished by the French invasion and unresisted conquest of Tunis. The same Government which first stimulated Greek aspirations, and then, in the alleged interests of peace, harshly repressed them, has now approached the verge of an unprovoked rupture with Turkey, and it has at the same time given warning to Europe that its eleven years' quarantine of peace has come to an end. The French Ambassador at Constantinople is said to have given notice to the Porte that the despatch of a Turkish squadron to Tunis would be treated as an act of war. It is not ascertained that any sudden change has taken place in the language of the French Minister at Athens; but the enemy of their enemy will be regarded as the friend of the Greeks. The concert of the Powers, to which the Greek Government prudently yielded, will have been disturbed, if not destroyed, by the Tunis expedition.

While foreign embarrassments were sufficiently urgent, the attention of the SULTAN and his Court has suddenly been directed to a strange domestic episode. Information, spontaneous or other, had been given of the murder of the Sultan ABDUL AZIZ, who had been supposed to have committed suicide immediately after his compelled abdication. The whole melodramatic machinery of Oriental regicide seemed to have been employed in the comparatively easy enterprise of assassinating a solitary and unarmed man. The SULTAN himself presided at the inquiry, and it was reported that in his just indignation he was with difficulty prevented from treating the perpetrators of the crime as MACBETH dealt with DUNCAN's grooms. The highest personages in the State were, if the evidence was true, implicated in the murder, one of the chief criminals being the notorious MAHMOUD DAMAD, brother-in-law of the present SULTAN. None of many dishonest courtiers did more through incapacity or treachery to accelerate the ruin of his country during the Russian war; but his intrigues at Constantinople, and his suspected complicity with the invader, never at that time alienated the good will of the SULTAN, though he has since dismissed his former favourite. The conspirators had, according to the witnesses, suborned a confidential officer of ABDUL AZIZ's household, who had introduced these murderers into the room of the dethroned Sultan. One of them, a professional wrestler, pinioned the victim, who struggled violently; and, after inflicting severe bruises and wounds, they ultimately finished their task by opening his veins with the scissors which he had been supposed to use in killing himself. The ramifications of the plot were carefully traced, with the result of implicating several considerable personages, including MIDHAT PASHA. By degrees it began to be discovered that the witnesses had displayed an excess of zeal. They had reported the murder as

having been perpetrated with extreme violence, though a commission of European physicians, after examining the body, reported that there was no trace of any injury, except the opening of the veins. It was also observed that the accused persons were those whom the SULTAN was known to regard with dislike or suspicion. It was at least a singular accident that all his enemies should have been engaged in a conspiracy which would enable him to take full revenge. The selection of supposed accomplices may perhaps have been too indiscriminate; and the SULTAN may have apprehended dangerous results from the fears of others who might expect to be accused.

One probable object of the inquiry has been attained by the deposition of MIDHAT, who has taken refuge in the French Consulate at Smyrna. A Constantinople writer characteristically observes that the conduct of MIDHAT is a sufficient proof of his guilt. His attempt to secure his personal safety may be as plausibly explained by a belief that his accusers are powerful enough to take his life. The whole story may be true, as it is told of Turkish Ministers and courtiers; but the witnesses for the most part belong to the same class, and it is not improbable that the prosecution is a deliberate plot.

RAILWAY SERVANTS AND THEIR WORK.

THE attitude of the reasonable public towards the nine-hours question is easily described. They let it alone. Like the wages question, it is a matter to be settled between masters and men. In point of fact, it is really the wages question in another form. When men can make their own terms about the money they shall receive for a day's work, they can, within similar limits, make their own terms about the length of the working day. No doubt it is to the interest of the master to make the working day as long as is consistent with getting work of a fair quality done. Many of the expenses he has to meet will be equally large whether his mill or his workshop is open for a longer or shorter time. But the amount of goods he will be able to sell, and consequently the profits he will be able to make on them, will vary with the time his machinery is running. The workman, on the other hand, has simply to consider whether he likes money or leisure best. In the long run he will not be paid as much for a nine-hours day as he would for one of ten hours, and supposing that he is able to decide the question for himself, and not leave it to be decided by the master, it must rest with him to say whether he likes short hours and less pay better than long hours and more pay. He is not bound to consider which his employer would wish him to choose any more than an employer, having the power to settle the question, is bound to consider which his workmen would wish him to choose. Whether the workman who chooses nine hours instead of ten is wise or foolish depends upon the use to which he puts the hour gained. If he spends it in any way which gives him harmless pleasure, he is wise. If he spends it in getting drunk a little earlier in the evening than he would have done if he had been working ten hours, he is foolish. So long, however, as he does not inflict positive annoyance upon others by reason of his additional leisure, no one has any more right to inquire how he spends his time than how he spends his money. He is his own master, with full right to work just so many hours as he thinks fit and no more. In a country where speech is free, the public will criticize his decision upon this point just as they criticize everything else. But he is no way bound to attend to what the public say; nor does it come within the province of the public to control in any way the action either of masters or of men.

Does the case of the railway servants who are now agitating for a nine-hours day present any difference to that of any other body of workmen? That there is a general disposition to draw a distinction between the two cases is evident from the proceedings at Exeter Hall on Wednesday evening. Members of Parliament do not ordinarily attend meetings called together to further a trade movement. The law cannot usefully interfere between master and man, and those who help to make the law are well advised in giving no encouragement to deceptive hopes of aid to be given by the Legislature. The difference between this and other seemingly similar cases which plainly existed in the minds of those present at the meeting has, however, its counterpart in fact.

The public has a right to take part in this particular controversy because its own safety is directly concerned in the result. The railway servants do not only plead that, under the existing conditions of their service, they work more hours than they find pleasant or wholesome. If this were all, they would be precisely in the position of any other workmen. What they plead is that they now work more hours than is compatible with the safety of the public, and upon this, as a matter directly touching itself, the public has a right to speak. If the Railway Companies were in the habit of employing defective materials in the construction of their lines, or if they went on using their rolling-stock after it had ceased to be fitted for the safe conveyance of passengers, Parliament would be quite justified in interfering, provided that it were satisfied that it could interfere to good purpose. If, instead of employing defective materials or worn-out rolling-stock, the Railway Companies choose to employ defective human material, in the shape of men who have already been working so long that they cannot do what they are set to do efficiently, the same reasoning applies. The public dislikes having the lives of travellers endangered by those who enjoy a virtual monopoly of passenger carriage, and it is justified in showing that dislike by any effectual means that present themselves.

The meeting at Exeter Hall on Wednesday does not seem to have had the case properly presented to it. The keynote of the speeches was an inaccurate parallel between railways and mines and factories. The Legislature has interfered for the protection of the workman in these latter cases; why should it not equally interfere for the protection of the workman in the former? The answer is that neither in mines nor factories is there any interference of the kind now asked for. There as elsewhere, if a man can find a master willing to employ him, he may work the whole twenty-four hours. The Legislature has forbidden the employment of women and children for more than a certain number of hours in a day, but it has considered that men can only get adequate protection by learning to protect themselves, and consequently that any attempt at giving them statutory protection will do them more harm than good. The difference between this case and that of the railway servants lies in the fact that the safety of the public largely depends on the quality of the work done by railway servants, and that this quality is directly and dangerously affected by the number of hours they work. The pointsman, the signalman, the guard, the engine-driver, need to have all their wits about them. At any moment while they are at work the safety of a train and the lives and limbs of the passengers may depend upon their knowing exactly what to do and when to do it. The least mistake or delay in the interpretation of a signal or in the application of a complex system of machinery may be fruitful in disaster. A man who is tired out with the work he has already done cannot be expected to be proof against the liability to make such mistakes. Fatigue and want of sleep have made him stupid and irresolute. He does not read as by instinct the meaning of the facts he has to interpret, and when he has read it there is an interval—not a long interval, perhaps, but still an interval—between reading it and acting upon it. In each of these shortcomings there is the material for a railway accident. A man's brain and will are only able to answer to a certain amount of demand on them. After that they must have rest, in order to fit them to answer more demands. If the complaints of the railway servants are true, their employers do not take this circumstance into account. So long as a man is at his post, they assume that it is all right, and that he will do the work of it equally well whether he be fresh or exhausted. If railway servants are not strong enough of themselves to put an end to this system, the public must look after its own interests, and take measures to prevent the Railway Companies from exacting more work from their men than can be given consistently with the work being as good as it ought to be.

There is, however, one precaution which it will be very necessary to take if ever anything is done to check railway overwork by statute. When an ordinary workman determines to agitate for a working day of nine hours, he may have one of two objects in view. He may wish either to work that number of hours and no more, or he may wish to work more than that number of hours, but to be paid at a higher rate for the additional time given. As to which of these objects he most desires, he must himself be

the judge. If he puts an extraordinary strain upon his strength and endurance, he has a right to ask his own price for so doing. But where the public are concerned the case is different. What it desires is to secure its own safety, and this will be equally imperilled whether railway servants work for too long a time at a stretch for extra pay or for their ordinary pay. If a man is half asleep, he will not be made wakeful by the circumstance that he is being paid sixpence an hour instead of fourpence. It may be a consolation to him at the end of the week to think that he has something to show for the discomfort he has endured, but it will be no consolation to the sufferers by the accident which his sleepiness has caused. If Parliament attempts to prescribe the length of a railway working-day, its interference must take the form of absolute prohibition. The working day must consist of so many hours, and no more; and the Companies must be forbidden to employ men for more than that number of hours, no matter how willing a Company may be to give extra pay or how anxious the men may be to earn it.

CO-OPERATIVE FARMING.

ALTHOUGH no practical proposal has as yet been submitted on the subject to the public, yet some attempts have recently been made to show that the co-operative or joint-stock principle of carrying on business might be advantageously applied to farming. It may be conceded that, if the application is possible, and that if farming is a business which can be profitably carried on by a Company, the present is a favourable time for trying the experiment. If it is supposed that the Company is to own the land it cultivates, the market price of land is now lower than it has been for many years. If the Company is to rent its land, it would now be in an excellent position to make terms with landlords, who are looking in vain for solvent tenants. It might get farms at rents much below the old rents, not only because there is no competition for farms, but also because landlords would make an extra sacrifice in order to have the certainty of punctual payment which a Company possessed of large resources and with an uncalled capital to be paid up, if rents had to be met in a bad season, could unquestionably give. Then the things a Company could offer are precisely the things that English land wants at the present moment. These things are capital, skill, and the readiness to make experiments. The farmers of England never had enough capital to do justice to the land, and they have lately lost a large portion of the capital they possessed. Landlords, many of whom are encumbered, and many of whom are without a large portion of their rents, are equally unable and unwilling to sink capital in the soil; and the contest with American importations can only be carried on successfully by the expenditure of very much capital. Skill, too, is greatly needed. It is needed to prevent the waste of manure, to drain judiciously, and still more to keep drainage when done in good order, to feed cattle so that the land may carry its full complement of stock, to make decent butter and marketable cheese. Lastly, it is not as yet known what are the crops which England can most advantageously grow. There are persons, for example, who think that beetroot and chicory might be grown to a profit on a large scale. They may be right or wrong, but experience is the only test of such suggestions, and a rich Company could afford to make many experiments, and to set success in one against failure in others. There is also just now a plethora of money seeking investment, and a very large number of investors prefer home investments to any other. If the promoters of an Agricultural Company could show a reasonable prospect of a steady return on the capital asked for, they would get their capital, and would get it from persons who would neither expect nor wish for a very high interest on their outlay. There must be good years and bad years in farming, however conducted. But, if the surplus of good years was put by to supply the deficiency of bad years, and if investors could be sure of an equalized dividend of 5 per cent., they would subscribe. The real question, therefore, to decide is whether there would be a reasonable prospect of a solid, well-managed Company earning an equalized dividend of 5 per cent.

Sir EDWARD SULLIVAN has rushed into print with an

enthusiastic answer to this question. He speaks of joint-stock farming as JOHNSON spoke of the vats and tubs of *THRALE*. He sees before his joint-stock Company possibilities beyond the dreams of avarice. But when we look into his figures we are all at sea. There is nothing on which we can rest our feet. He has collected many valuable facts as to the present state and the present needs of agriculture; but he seems to have no power of approaching his subject from the other side, and considering how the prospect would show itself, not to a lover of agriculture, but to an investor. He takes an imaginary case, and works out very strange results. That he should take an imaginary case is no reproach to him. Some case, necessarily imaginary, must be taken, in order that discussion may be possible. It is by the mode in which the imaginary case is handled when it is taken that the reader judges the writer. In Sir EDWARD SULLIVAN's imaginary case there is supposed to be a landlord with twenty thousand acres of such a quality that each acre gives 1*l.* rent and 1*l.* gross profit to the farmer. The landlord sells his land to a Company at twenty years' purchase, at 400,000*l.*, and takes the whole purchase-money in shares. The Company has a working capital of 10*l.* per acre, or 200,000*l.*, and a reserve of uncalled capital to the amount of a further 100,000*l.* The Company has 600,000*l.* of subscribed capital and an income of 2*l.* per acre, or 40,000*l.* a year. This, says Sir EDWARD SULLIVAN, with triumphant innocence, is 6½ per cent., and the landlord and the other shareholders would be the happiest of men. No doubt they would, and the extraordinary conduct of a landlord who accepted twenty years' purchase and took his purchase-money in shares would have been justified by the result. But the calculation leaves entirely out of sight that the supposed profit of the farmer is only gross profit, and leaves superintendence to be paid for. A farmer paying a fair rent, with skill and luck, and with 60*l.* an acre to start with, may perhaps, even in these times, get 10 per cent. on his capital. But he gives up his life to getting it. A Company would have to pay for superintendence, and would have to pay enormously high. There would be the head office, with its directors, secretary, and clerks; and the directors, to attract confidence and to fulfil their duties properly, must be men of high standing, great experience, and willing to devote a large portion of their time to the business of the Company. It is not a small thing to know how twenty thousand acres of land ought to be managed, and to be responsible for their being managed in the best possible manner. We may put down 3,000*l.* a year as a moderate estimate for head-office expenses; and that this is a moderate estimate will be apparent to any one who reflects on the very elaborate system of account-keeping which the management of twenty thousand acres would involve. Then there must be a local manager, a man of a very high class, learned, skilful, indefatigable, and so well paid as to be above temptation. Under him must be two or three assistants constantly visiting every part of the property, and seeing that his directions and those of the Board were carried out. The salaries of the manager and his assistants would perhaps come to 2,000*l.* a year. Lastly, there must be men to do the daily and hourly work the farmers do now—to see that the labourers work with zeal and efficiency, to look after the animals, to show how implements are to be used, to inspect every operation of the dairy. Such men could scarcely look after more than two hundred acres, and would scarcely take less than 100*l.* a year. That is, there would be a hundred men getting 100*l.* a year—or, in all, 10,000*l.* The total expenses of superintendence would thus reach 15,000*l.* a year; and the nett income of the Company would dwindle down from 40,000*l.* to 25,000*l.* a year; and it would pay, not 6½, but 4 per cent. on its capital.

To this an enthusiast like Sir EDWARD SULLIVAN might possibly reply that when he speaks of 1*l.* per acre being the gross profit, he means that this has been the profit under the present unscientific system. It may be doubted whether this does not give much too favourable a picture of the farmer's recent history. If he has really, on an average of the last ten years, been getting 1*l.* an acre with a capital of 10*l.* per acre, he has been getting 10 per cent. for his money; and, if he has had less capital and has still got his 1*l.* per acre, he has been still more fortunate. Most farmers would have a very different tale to tell, and would say that, if they now started with 10*l.* per acre of capital, they must show quite a new kind

of skill and have good luck in order to get their 10 per cent. in the future. But it may be allowed that, if 1*l.* gross profit has been the yield hitherto, more might be earned with more skill and more capital. But then how much more capital would be wanted? Sir EDWARD SULLIVAN leaves this a perfectly unknown quantity. He describes, indeed, what would take place on his ideal farm under his ideal system. Fences would be levelled, and fields enlarged; every part of the estate would be properly drained, and the drains kept in order. Farmyards would be covered; the young stock would be doubled; none but the best breeds would be admitted; the best and newest machines would be constantly introduced, and factories for making cheese, and even sugar, would be established. This is a charming picture of agricultural opulence, but no one can seriously think that it could be realized with a capital of 10*l.* per acre. Double the amount would scarcely suffice. That there would be an extra yield with the application of double capital may be admitted, but the investor would want to know what the extra yield would be likely to be. It would need very confident statements on the part of very experienced and competent judges to make him believe that, with double the capital, there would be double the gross profit per acre. Let us, however, assume that this could be shown, and revert to the imaginary case of Sir EDWARD SULLIVAN. The shareholders would now have a capital of 800,000*l.* and a revenue of 60,000*l.* After the wages of superintendence had been deducted, they would have 45,000*l.* to divide, or about 5½ per cent. This might suffice to tempt them; and, although they would never find the landlord who was willing to take twenty years' purchase all in shares, they would be able to put themselves in an equally good position by buying the land and raising two-thirds of the purchase-money on mortgage, at a low rate of interest. The notion of joint-stock farming is not, therefore, to be rejected at the outset, as something altogether impracticable. But when we have got thus far, we are still very far from seeing how a joint-stock Company that is not a mere sham is to be started. What evidence is there that double capital would earn double returns? And even if the difficulty of showing this could be overcome, there remains a still greater difficulty. Where are the men to be found who would be willing and competent to direct such a business? Their duties would be laborious, anxious, and continuous. They would be blamed for every mistake, and very little thanked for any success; and yet they must be men of very exceptional ability and knowledge. Possibly such men are to be found. It is never safe to give too positive a denial to anything. But it may safely be said that any one who wished to find them might turn over very many pages of the Directory of Directors without coming on anything that could satisfy him.

THE SCRUTIN DE LISTE.

THE report of the preliminary Committee upon M. BARDOUX's Bill was extremely unfavourable to the abolition of the *Scrutin d'arrondissement*. It was not a very convincing document; but of this the subject rather than the author must bear the blame. The truth is that the arguments on each side are pretty fairly balanced. Large constituencies have their advantages equally with small ones, and the consideration which would naturally have most weight with the deputies points to different conclusions in different parts of France. If the majority were everywhere Republican, and the minority everywhere reactionary, both parties would know how to vote. The Republicans would all be in favour of the *Scrutin de liste*; the Conservatives would all be in favour of the *Scrutin d'arrondissement*. But, unless the warnings addressed to the Republican supporters of the Bill are wholly without foundation, there are several departments—M. BORSSER, the author of the Report, says from fifteen to twenty—which will be lost to the Republican party if the *Scrutin de liste* is adopted. M. GAMBETTA may be supposed to have satisfied himself that, on the balance, the gain will be greater than the loss; but this is but poor comfort to the Republican deputies who look to see their own districts lost to the Republic. If the minority could emigrate into some more favoured department, and there enjoy all the influence and consideration to which it has been accustomed, they might not mind the change. For them, how-

ever, it means nothing short of political extinction; and it is expecting too much of human nature to ask it to accept such a fate in order that the party majority in the Chamber may be swelled by a few additional votes. M. BORSSET is altogether incredulous as to the improvement in the character of the Chamber which the defenders of the Bill maintain must follow from the enlargement of the constituencies. He maintains that all the best Assemblies that France has seen have been elected by constituencies returning one member each, and that the only reasonable guarantee of excellence in the deputies chosen is the intimate association of electors and candidates. Under the *Scrutin de liste* this association will be impossible, and the choice of the candidates will necessarily be made over to committees. The first of these arguments is not very conclusive, for opinions will differ as to which have been the best Assemblies; and upon almost any theory of Parliamentary merit the present Chamber must be excluded from the list. The intimate association of electors and candidates has certainly given exaggerated importance to agreement upon local questions. The elections themselves may not turn upon the opinion of the candidates as to a road or a bridge, because to electors of all views these matters are for the present of less interest than the political issues involved. But when the question is not whether the constituency is to be represented by a Republican or by a Monarchist, but who the Republican or Monarchist candidate shall be, agreement upon roads and bridges becomes very essential. As regards purity of election, English experience up to this time bears out M. BORSSET's opinion that a change in the grouping of the constituencies will have but little effect. Alike under the *Scrutin de liste* and under the *Scrutin d'arrondissement*, the voters will be the same, and their weaknesses will be the same. Public morality is not created by statute. Perhaps the most telling argument against the *Scrutin de liste* is the objection that it really introduces indirect election; since the elector, not having the knowledge necessary for the selection of a candidate, really does no more than help to choose a committee, which in its turn chooses a candidate. But this, again, has its answer in the plea that when the electors are not able to choose good candidates, the sooner they make over the function to better qualified persons, the more likely they are to be properly represented.

The strong array either of arguments or of interests on each side of the controversy was shown by the extreme narrowness of the division. In a country in which the existing Constitution was carried by a single vote, this circumstance may be of less importance than in countries where public opinion is given to declare itself more decisively. Still, eight votes is but a small majority for a measure which excites so much feeling and affects so many interests. It is a victory, of course, for M. GAMBETTA, but it may be doubted whether it is such a victory as will materially increase his strength in the country. It must be borne in mind that M. GAMBETTA has made unusual efforts to get the *Scrutin de liste* adopted. The journal which usually sympathizes with his views, if it no longer avowedly represents them, has taken the leading part in the discussion for months past. M. GAMBETTA himself has given an interminable series of missionary breakfasts, to which every Republican deputy has in turn been invited and made to listen, or appear to listen, to all the reasons which the host's ingenuity could devise to prove that the salvation of the Republic, and consequently the success in life of every Republican, depended upon the acceptance of M. BARDOUX's Bill. At one time it seemed as though the decision, whichever way it went, must involve the overthrow either of the President of the Chamber or of the President of the Republic. This suspicion was, it is true, upset by M. GAMBETTA's ostentatious attendance at M. GRÉVY's ball, and since that time these august names have not been dragged before the public with quite so much persistency. Still, the fact that M. GAMBETTA has himself undertaken the defence of the measure, and for the second time during his tenure of his present office exchanged the chair for the tribune, is in itself calculated to strike the imaginations of his supporters, and to associate him in the most marked manner possible with the fortunes of the Bill. Now it will appear that all these powerful forces have been called into play with no more conclusive result than to give M. GAMBETTA 243 votes as against 235. The majority is sufficient to carry the Bill—it would have been that if seven votes had been subtracted from it—but is it suffi-

cient to sustain M. GAMBETTA's reputation? Until now his power has gained in public estimation by the mystery in which it has been enveloped. It has always been assumed that he had only to make his wishes known to engage the great mass of the Republican party in the pleasing task of giving effect to them. Now it turns out that in a Chamber in which the Republican party commands a very large majority M. GAMBETTA can only secure eight votes in favour of a Bill which he proclaims himself to have greatly at heart. How will this circumstance affect his position out of doors? Will the division of Thursday be hereafter held to mark the beginning of his formal rule or the close of his informal ascendancy?

Those are not questions to which it is possible to give a perfectly confident answer. On the whole, however, it seems probable that before many days are over, the circumstances of M. GAMBETTA's victory will be forgotten in the fact that a victory has been won. The figures of the division may from time to time be brought up against him by his opponents, but they will be of little importance by the side of the fact that the *Scrutin de liste* has taken the place of the *Scrutin d'arrondissement*. From this point of view the secrecy with which the division was invested may prove of considerable importance. The ballot was demanded, no doubt, in the hope that some Republican deputies would thereby be encouraged to vote against M. GAMBETTA. But men who could only retain the courage of their convictions by keeping it dark what those convictions were will not be likely to make a boast of having voted in the minority. The number of Republican deputies who will continue to preach against the *Scrutin de liste*, when once it has become the legal method of voting, will be small. The candidates in England who, if they are to be returned at all, must owe their return to household suffrage, do not now abuse household suffrage. A man who now declares his preference for the *Scrutin d'arrondissement* will naturally be set down as a man who knows that the substitution of the *Scrutin de liste* has made an end of his chances of re-election. Consequently, to continue the warfare now that the change has been voted will be to identify himself with a lost cause, and to forego any lingering possibility there may be of his retaining in the department the position he has held in the *arrondissement*. This disposition to retreat while retreat is still practicable was plainly shown in the treatment given to the Bill on Thursday. So close a division might very well have been the prelude to an obstinate fight in Committee. When what answers to our second reading had been carried by only eight votes, it might have been thought that the further progress of the Bill would have been resisted at every stage, in the hope, before all was over, of converting the majority into a minority. Instead of this, the several clauses of the Bill were at once put to the vote, and upon only one of them was any division taken. The figures of that division show that a reaction had already begun. The votes in favour of the clause were 299; the votes against it were 222. That is a very considerable change from the previous division; and it proves how much more importance the Chamber attached to M. GAMBETTA's victory, narrow as it was, than to M. GAMBETTA's arguments. It will not be surprising if, by the time that the General Election is held, it has become impossible to identify any of those who voted in the minority of Thursday. They can only be identified on their own confession; and they will take very good care not to confess anything that may criminate themselves.

FREE SCHOOLS.

DR. CAMERON has had a Wednesday all to himself, and has enjoyed the advantage, so valuable to a legislator, of ascertaining the amount of opposition he will have to overcome before he can hope to see free education established in Scotland. It is not often that a Bill is so generally abused as Dr. CAMERON'S, and indeed it is not often that a Bill so well deserves it. Free education stands now in a very different position from that in which it stood when the Education Act of 1870 was under consideration, and many who were not then prepared to reject the idea entirely must now have seen reason to change their minds. In 1870 a great experiment was going to be tried, and it was impossible to foresee with any certainty what the results of the changes about to be introduced would be. Attend-

ance at school was to be made compulsory in many parts of the country, and there were some who predicted that, so long as school fees continued to be exacted, the resistance offered to the new law would be insurmountable. It was quite uncertain, again, whether the competition of Board schools would not in the end drive voluntary schools out of the field, and in that case one of the great obstacles to the abolition of school fees would be removed. The intention of those who framed the Act of 1870 was to give voluntary schools the chance of holding their own against Board schools, provided that they could do so in a fair field and with no favour shown them. The establishment of free schools would have been plainly inconsistent with this intention; but it was conceivable that, if voluntary schools ceased to exist and Board schools became universal, the comparative merits of payment by rates alone and payment partly by rates and partly by fees might deserve to be further investigated. We are now in the eleventh year of the new educational system, and both these theories have been proved false. Compulsory attendance has been extended to the whole country; and, except in a case here and there, where the law has been applied with injudicious rigour, it cannot be said to be unpopular. There are parents who do not like being forced to send their children to school, just as there are parents who do not like being forced to take their children to be vaccinated, but they form only a small minority of the population; and, as a rule, the law making attendance at school compulsory has met with as little resistance as any other law that can be named. The necessity for making education gratuitous, which was expected to spring from making it compulsory, has consequently not arisen. The great majority of parents pay the school fees without murmuring, and for those who are genuinely unable to pay them, it has not been found difficult to make another provision. As to voluntary schools, instead of becoming less numerous and less prosperous, they have positively grown in both ways. There are more of them than there were ten years ago, and the education given in them is of a better quality.

Now, to set up free schools by the side of voluntary schools would be to risk their complete extinction. Under very favourable conditions they might stand even this rivalry, and it is also possible that the liberality of those who maintain voluntary schools might rise with the demand, and that they might be enabled by additional subscriptions to remit the fees now charged as completely as the School Boards themselves. We have no right, however, to assume that these consequences would follow. The more natural supposition points to the direct contrary as the thing that would probably happen. If so, the introduction of free schools would be the introduction of religious dissension in its most acute form. Let us suppose, for instance, that in a certain town there are enough Roman Catholics to support a school of their own. So long as the children must pay so much a week to whatever school they go, there is no inducement even to the most thrifty parent to send his child to the Board school rather than to the Roman Catholic school. He has to pay his twopence or threepence a week in either case, and there is nothing therefore to prevent him from giving full play to his religious convictions. If education at the Board schools were given gratuitously, the parent would be under a very direct, and if he were a poor man a very strong, inducement to take his children away from the Roman Catholic school, to which, other things being equal, he would rather send them, and to place them at the Board school. If he had three children of school age, the change would involve a saving of sixpence or ninepence a week, and that is something to a man whose weekly income is reckoned in shillings. The effect of this would be to withdraw the children from Roman Catholic influence during the week, and to leave the priest only the Sunday in which to get at them. No doubt this is in itself a result which, especially in Scotland, would send a thrill of satisfaction through many Protestant minds. Indeed, it may even seem that the prospect of bringing about such a blessed state of things is in itself the strongest possible recommendation of Dr. CAMERON'S Bill. But those who remember what a fertile source of national discord religious differences can become, and what additional intensity is imparted to religious differences when they find expression in anything connected with the bringing up of children, would be slow, even if they wished for free education on other grounds, to advise its adoption.

But for the "ignorant patience" of ratepayers the finan-

cial argument would be conclusive against Dr. CAMERON'S and all similar proposals. In the first place, free schools would dry up the great stream of voluntary contributions which now tends to grow larger instead of smaller. As it is, a very large sum of money is every year presented to the community by benevolent persons, who in return only ask that they shall be allowed to open schools, to which such parents as like may send their children. With free education this sum of money must either be enormously increased or the permission to open schools must become a dead letter. It is not to be expected that parents will go on paying in a voluntary school for the same education which a Board school offers them for nothing. Consequently, unless the subscribers to voluntary schools are prepared to increase their contributions to an amount which will enable the managers to charge, no fees, and thus to place their schools once more on the same level as that occupied by the Board schools, voluntary schools must be closed. In other words, all the money which is now presented to the ratepayers will then have to be found by the ratepayers. In the next place, the incidence of the educational outlay will be entirely changed. Already a very large proportion of it is lifted off the parent's shoulders, but under a system of free education the whole would be lifted off. The parent would pay nothing, the community would pay everything. The notion of its being a parent's duty to give his child the instruction proper to his place in the world would disappear. The only persons who would have any duty in the matter would be the ratepayers. It would be essential to repudiate the theory that a parent is under any obligation to supply his children with intellectual food, as otherwise the natural inference would be that, if the community bears the cost of a father's performance of his duty as regards the mind, it is equally bound to bear the cost of his performance of his duty as regards the body. If a father is as much bound to give his children rudimentary instruction as he is to give them bread, why should the community, which relieves him of one duty, hesitate to relieve him of the other? There is no argument that can be alleged in this country at the present time for the gratuitous education of children which would not equally make for their gratuitous feeding. Mr. MUNDELLA entirely disposed of the argument which is sometimes drawn from the example of the United States. Free education in America is a totally different thing from free education in England or Scotland. In the United States the elementary schools are really common to the whole community. People of all classes send their children to them. It follows from this that the question how the cost shall be borne becomes simply one of convenience. Everybody has his share of the benefit—bachelors, spinsters, and childless parents being too few to affect the general conclusion—and it is a matter of no moment whether everybody pays his quota in the shape of school fees or of a school rate. In England the case is different. Elementary schools are, in truth, schools intended for a particular class in the community, and if the entire cost of educating children at them is transferred from the parents to the ratepayers, the community will pay for the education of a single section of its members. Free education has far more in common with Socialism than a Poor-law, because it is a distinct recognition of an obligation on the part of the rich to pay for giving the poor what is good for them. We may be sure that if once the principle is admitted to this extent, it will not be long before it is pushed very much farther.

THE NEW NEW TESTAMENT.

THE eighth rule under which, eleven years ago, the revisers of the New Version were appointed, suggests a triple court of referees, composed of divines, scholars, and literary men. The admission of the last section acknowledges the undoubted fact that the putting forth of a new Bible concerns criticism in other aspects than those of mere theology or mere scholarship. The case is, indeed, a somewhat peculiar one; and a certain tincture, both of theological and philological culture, must be demanded even from a literary critic who passes his opinion on such a work. The rather quaint dehortation of the Bishop of London to "young clergymen who cannot construe the original" need not have been confined to the clergy. Indeed, we should have thought it part of the office of a Bishop to take care that, at any rate in his own diocese, there were no young clergymen who cannot construe the original. But when the original court has been purged of those who have no business to criticize at all, the remnant will have a

tendency to split up into the three bodies mentioned in the rule. Some will look at the new book mainly as a part of the canon, others as a version from the Greek, others, again, as an attempt to repair or restore one of the masterpieces of English literature, a masterpiece which has the rare peculiarity of being equally possessed of merit and of popularity. In the present article the last point of view, and that only, is the point which we shall take; though, as has been already mentioned, it is impossible to take it without taking also due account of the limitations imposed by the others.

The revisers, to do them justice, have not shown themselves, at any rate in plan and intention, otherwise than highly sensible of the literary merits of the Authorized Version. They are lavish of praise (almost unnecessarily lavish, it may be thought, for the case is one of *quis vituperavit*?) of its rhythm, its cadence, its language. They boast themselves to have observed these to the utmost of their power; and, in innovating, they have, say they, been loth to take any word which had not the sanction, if not of the Authorized Version itself, at any rate of contemporary literature. They have, moreover, shown excellent taste in rejecting many suggestions of the American Committee, which would have tended to modernize, and therefore to deform, the book almost irrecoverably. The proposed striking out of the "Saint" from the titles and headings of the Gospels is of course merely sectarian. But the suggestion that "Holy Spirit" should be substituted for "Holy Ghost" throughout shows that the American revisers entirely failed to appreciate the attitude in which, in England at least, the work was approached. The logical result of such a change would have been the rewriting of the whole in leading-article English. The same may be said of the suggestion to substitute "bathe" for "wash," "drag" for "hale," "they are" for "they be," &c., and, worst of all, "demoniac" for "possessed with a devil." The revisers, with not less logic than taste, rejected these, though in some cases, with neither logic nor taste, they admitted them to the margin. But, on the whole, it must be confessed by any fair reader that in general intention, at any rate, they have kept before them the standard to be observed—that is to say, the alteration of nothing which did not seem to require alteration from the point of view of theology or scholarship. The question then remains, how far in making these alterations they have observed the same standard from the point of view of literature?

The literary principles on which they have gone are embodied in a rather voluminous preface, which we do not regard as one of the happiest features of the work. It has somewhat the air of a very workmanlike and interesting magazine article, informing the curious reader of many facts which he would like to know. Such a thing, however, seems to us, we must confess, somewhat out of place in the forefront of a book such as this. It is doubtless very interesting to know that the revisers "entered into an agreement with the Universities of Oxford and Cambridge for the conveyance of copyright," and that this arrangement "provided for the necessary expense of the undertaking." To turn the page, however, and read that the book about which this business-like gossip is recorded, and of which the record is part and parcel, is "The New Testament of Our Lord and Saviour Jesus Christ," causes a rather odd revulsion of feeling. This, however, may seem a nice question of taste, and one to be mentioned rather than discussed. Perhaps less reticence need be observed about some of the purely literary rules which the translators have laid down for themselves. They find fault with their predecessors for the variety of terms used in rendering identical words of the original; they think that this variety of expression "would now be deemed hardly consistent with the requirements of faithful translation." Now, on this point we hold that King James's men were quite right and Queen Victoria's men quite wrong. No one who translates "with the head," as Mr. Carlyle used to say, and not with the dictionary, can be ignorant that variety of this kind is required, not merely to express actual shades of meaning, but to produce the proper literary colour in the version. Another point (also purely literary) on which we are not altogether satisfied with the revision is its structural arrangement. Verses, of course (and, for the matter of that, chapters), have no absolute authority. But it surely can escape no one that such masters of rhetorical prose as the translators of the Authorized Version must, in preparing a translation to appear in verses, have shaped their clauses and cadences otherwise than they would have shaped them if they had intended the version to appear in paragraphs. This is so simple a point of the criticism of style that it seems astonishing that it should have escaped the revisers. By their new arrangement much—very much—of that rhythm and cadence which they so enthusiastically admire must be obscured or lost unless the reader guides himself by the very division which they have discarded and relegated to the margin. This argument applies still more strongly to the useless pedantry, as we cannot but think it, of inserting poetical quotations from the Old Testament in "parallelisms." This results in an unnecessary and fantastic dislocation of the text, which does not appear to be compensated by any solid advantage. The advantage sought is said to be that "the reader's attention is directed to the poetical character of the quotation." The fact is incorrect; for the quotation is not poetry, but a prose translation of poetry. Moreover, the information sought to be conveyed, like much else which the Revised Version contains, especially in its margin, seems to be rather matter for a commentary than for a standard translation. However this may be, we shall only ask any reader with an ear to compare the old and the

new versions of the fine quotation from the 42nd chapter of Isaiah:—

Old.—The people which sat in darkness saw great light: and to them which sat in the region and shadow of death light is sprung up.

New.—The people which sat in darkness

Saw a great light,

And to them which sat in the region and shadow of death

To them did light spring up.

Here the contrast between the suave completeness of the old verse, where the poetical character of the original is surely indicated enough in all conscience, and the jerky rawness of the new parallelism can hardly escape any one. The sole gain seems to be the fuller representation of *avrois*; and, if any one thinks this of consequence, we shall not argue the point with him.

In an examination of the present kind it is not necessary to mention a multitude of minute details. We shall only say that the evil influence represented by the suggestions of the American Committee seems often to have worked unaccountably on the revisers. The indifference to the continuity of literature which characterizes many literary reformers is strikingly, and we must say painfully, obvious in such gratuitous alterations as "robbers" for "thieves" in the crucifixion, "the last farthing" for "the uttermost farthing," and the like. These things have, in some cases, enshrined themselves in the most sacred associations, in others in the most familiar and constantly read literature of the profane kind. In neither of the two cases can the most pedantic philologist, who retains his senses, contend that there was any pressing necessity for change, while there are the strongest reasons against it. But the climax is reached in the Lord's Prayer and in the famous and splendid passage from St. Paul about charity. The Lord's Prayer is more difficult to criticize from the purely literary point of view, because considerations of theology and scholarship come in with greater weight than usual. The charity passage—one of the triumphs of the original—is infinitely worse treated. Here "love" is substituted for "charity." Now it may be granted, if any one pleases, that at the time of the original translation it was bold to use "charity." But the translators knew what they were doing. They wanted a word free from equivocal associations, and they chose one. Their choice has been justified. The full meaning of charity, in the sense of the passage, has passed into classical English, and will remain. If it be said that there is a baser sense of the word, it must be remembered that even that baser sense is but a minor form of the better; whereas "love," in the ordinary acceptance of the word in English, is quite out of place. That the substitution of a monosyllable for a trisyllable utterly ruins the concerted music of the piece is undeniable. But that the revisers were deaf to this is seen from their pedantic substitution of "done away" for "vanish away," where the original translators had employed the latter phrase to avoid an ugly homocoteleuton. A still more wanton aggression is the phrase "in a mirror darkly" for "through a glass darkly." If the "through" troubled the revisers, they might have substituted "in," and it would not much have mattered. But "mirror" for "glass" is absolutely unnecessary, the two being synonymous, and "glass" the more usual word in English literary as well as colloquial; it spoils the rhythm, and it injures a famous and often-quoted phrase. The only justification for this is, of course, the fact that St. Paul's *εἰς σκῆπτρον* was not made of the same materials as a modern looking-glass. This, however, is a singularly instructive example of the sorrowful chances that wait on mere pedantry. The material of the mirror is absolutely irrelevant to the understanding of the passage. On the other hand, all uninstructed persons will still think the revisers' "mirror" to be of glass; while no instructed person was ever ignorant that the Authorized Version's "glass" was of metal. The thing is an odd instance of a very common failing—the lack of literary perspective.

We have spoken strongly on these points, because we feel strongly on the impolicy, and so to speak the sacrilege, of tampering with the text in such matters, without excuse of divinity or scholarship. Let us now turn to the pleasanter and necessarily briefer task of acknowledging that the revisers have, on the whole, despite these unfortunate instances, restrained their hands from doing mischief, and that they have done much good in the way of redressing obvious slips of translation, and clearing up a few doubtful places. Only those who have had the liberty of literary cutting and carving themselves know the temptation which the process exercises even upon the most temperate and well-balanced minds. The revisers have, on the whole, resisted this temptation excellently. Whole pages of their work may be read without any jar, even to a reader whose familiarity with the Authorized Version is considerable, and who is on the watch for interference with his pet phrases. To give absolute satisfaction in such a case is not so much difficult as impossible. And, if the slips which we have pointed out are irritating—as they certainly are—it must be remembered that the Version is not final; that it is not, and cannot for years be, "appointed to be read in churches"; and that its compilers, before that time, may possibly be guided in a better way by some of those literary men whom they were bidden to consult, but whose advice seems to have been hitherto hardly what might have been expected, if it was indeed sought.

GOVERNMENT BY POST-OBIT.

THERE is one very curious feature of the general policy of Mr. Gladstone's Government which does not seem as yet to have attracted much public attention. It may be defined as a combination of the spirit of Lord Melbourne's too hackneyed maxim with that of the extreme advocates of a forward Radical policy. The conduct of the late Ministry was severely enough canvassed; but nobody denied that it was a policy which, whether wisely or unwisely, took thought for the morrow. The policy of the present Government seems, on the other hand, to be based on a rigid observance of that possibly misapprehended precept of Scripture. During this present year they have busied themselves so little with internal matters not relating to Ireland, that there has been no great opportunity of estimating their conduct in this respect. They have given no post-obits, because as yet no claims have been presented to them. But elsewhere the course of conduct has been nearly uniform, and in one particular instance it has extended to home affairs. The sudden dropping of the Bradlaugh business is a most curious political study. It admits, indeed, of two interpretations. It is not at all improbable that Mr. Gladstone thinks the Bradlaugh pear is not yet quite ripe, and that more of sweetness is to be sucked from it by a little judicious keeping. Mr. Bradlaugh is a skilled agitator, and he may possibly get up a kind of afterglow of the now fading Radical enthusiasm which shone on Mr. Gladstone twelve months ago. If this seems too Machiavelian a policy for a Ministry of all the virtues, the conduct of the Government cannot be set down to anything but a culpable desire to postpone the payment of their obligations. They have in the person of their chief avowed their belief in Mr. Bradlaugh's right to be furnished with a picklock to the door of the House of Commons. They proposed the fabrication of such a picklock, and yet because things did not go quite smoothly, they have left their *protégé* to lament his woes in the Hall of Science, and to have his wounds anointed only with the precious balsam of Mr. Osborne Morgan. It is difficult to conceive a more left-handed compliment to any one than that Mr. Osborne Morgan should be detailed to express sympathy with him. The Judge Advocate-General's name and reputation are so intimately connected with interment, that it would be nearly as complimentary to send a friend an undertaker and beg him to make use of his services. If the Bradlaugh question is to be buried, no one can superintend the operation more successfully than the Judge Advocate-General; but the wishes of the electors of Northampton and its singular constituency are not understood to tend in that direction. Meanwhile the Government escapes present responsibility, and they have the comfort of thinking, like all dealers in post-obits, that the day of payment will very likely be a long one.

Take the Transvaal, again. Here not merely the settlement, but the very discussion, of the preliminary terms are postponed in a manner still more curious. To all suggestions on the part of persons who are not satisfied with the peace of Mount Prospect, Mr. Gladstone replies that he really cannot think of arguing the matter until the Potchefstroom question is settled. Meanwhile his representatives are, according to all accounts, taking the very oddest means to settle the Potchefstroom question. The Commission, we are told, though not indeed officially, will not enter the Transvaal until the guns are given up. It would be difficult to imagine anything which the Boers would like better than that the Commission should not enter the Transvaal. This leaves them pretty well masters of the situation. They can harry Englishmen and loyal Dutchmen, "commandeer" against natives who are not too strong for them, and do everything else that is right in the sight of their own eyes, while the dreaded delimitation of territory cannot possibly take place. Meanwhile also the chances of a native outbreak, backed up by the loose adventurers of whom South Africa is full, and by aggrieved members of what used to be called the English party, is every day more probable, and the outbreak of such a thing would bring huge difficulty on the head of the Government. What does it matter? the longer the question is undiscussed, the more likely the constituencies and the average newspaper reader are to have forgotten all about it, and the more confirmed will the habit of trekking on the part of troublesome English settlers become. In the Afghan debate, on the other hand, there was a distinct reason against postponement. The missing reports might have turned up, and it might have been discovered what Sir Charles Dilke's information about Russian intentions on Central Asia was worth. Here, therefore, the Government acted with promptitude and paid money down; but in the Transvaal matter there is apparently something to be gained by a precipitate settlement and a delayed reckoning as to that settlement; and so the peace of Mount Prospect was huddled up, and the discussion of that peace is studiously postponed.

The Tunis matter is, in its way, a minor one from this point of view; but it exhibits the same curious preference for running any danger at a future time rather than undergoing the trouble and unpleasantness of a clear settlement at once. It is no wonder that Mr. Gladstone's noble, calm, just view of the Tunisian question delights the Chauvinist press of France. It is no wonder either that the French should be pleased with Sir Charles Dilke's invincible resolve to know nothing about the capacities of Biserta, the expense of making the port, or anything else whatever. Time to the invader is everything in such a transaction as that in which France has just been engaged. He can very reasonably object

when protests are (if ever they are) delivered that they should have been delivered before, and he has time to lengthen the cord and strengthen the stakes of his occupation. Besides, it is clear that, if the English Government was going to do anything, there was no need for it to wait. The fact that England has recognised the supremacy of the Sultan in Tunis is not affected by French explanations, nor the fact that the representations of French diplomacy on the subject have been notoriously falsified by the event. All Mr. Gladstone says is that the matter concerned the late Government more than the present, and that it is better to take time. The excuse from a person who entered on office pledged to undo everything that his predecessors had done is scarcely adroit; the postponement is quite of a piece with all the other proceedings just mentioned. It may be or it may not that a French occupation of the coast and the frontier of Tunis may be prejudicial to English interests. But that will not be for a long time. We are not at war with France; on the contrary, we want to make a commercial treaty with her. "It is on the ground of a commercial treaty," says a Parisian contemporary, quoted with much approval by a Radical evening journal, "that misunderstandings can be dissipated." In other words, "Let me steal Tunis, and I'll make it up to you on woollens and iron." Mr. Gladstone's words being enigmatic, it is not possible to say whether this high-minded bargain presented itself to his mind or not. It would, however, be an admirable example of post-obit policy. The advantage is present, the disadvantage distant and dubious. A wise Government, therefore (at least on this hypothesis), postpones the question, and holds out its hand for what good things gods and Republics may provide.

But, as usual, the most remarkable instance of this spendthrift tendency is to be found in connexion with Ireland. Mr. Plunket's excellent speech at Bristol last Wednesday summed up the charges against the present Ministry in a way which would be difficult for the most adroit Ministerialist to answer. When these charges are examined almost every false step which the Government have taken will be seen to have been prompted by the same curious desire to obtain immediate advantage, or, it may be, mere relief from troublesome duty at the cost of enormous and all but certain future loss and danger. The blandishments lavished on the Irish before the General Election, the neglect to continue the Peace Preservation Act, the neglect of the early incendiary campaigns of Mr. Parnell and others last summer—all these things were of the post-obit character. But it was when the autumn came, and the Land League began to show itself in its true colours, that the policy gave most deplorable results. Mr. Plunket very ingeniously showed how Mr. Forster's unfortunate admission, that, if he had called Parliament together to grant him extraordinary powers in the autumn, it would not have supported him, simply meant that the Radicals would have been out of temper. So, to secure their support (which, after all, he did not gain), the Irish Secretary let the dogs of anarchy loose on Ireland for some three months. Even when Parliament assembled the same plan was pursued. Coercion was threatened, but concession promised, despite the certainty that, with a very doubtful present gain of submission to coercion, a vast future appetite for concession would be created. Now, as is obvious to every one except the Government, Ireland has got out of hand altogether. They arrest; nobody cares a jot for their arrests. They proclaim; and the Leaguers, emboldened by months of impunity and by the doctrines of Prime Ministers and Cabinet Ministers, outrage away all the more. They bring forward, and will probably pass, their Land Bill. That Bill itself is one great attempt to secure a little present peace by rendering future trouble certain. The best inclined of the popular favourites in Ireland regard it only as an instalment; the less well inclined do not regard it even as that. It does not touch, as has been again and again shown, the cases of the men in whose nominal behalf the Land Leaguers are murdering and mutilating, robbing and mobbing. But it does openly, and without any attempt at disguise, attack property and ignore political economy. That is to say, a permanent precedent for similar attacks and similar ignorings is set up. The incredible recklessness of the arguments by which it was supported show the temper of the gambler who will put his name to anything if he thinks that "a noble he shall have and present pay." Thus, for instance, when Mr. Gladstone wished the other night to prove that Parliament had in former times infringed the security of tenure of the Irish tenant, what was his argument? That in 1816 an Act was passed the preamble of which recited that "such were the expense and details of ejectment that it was impracticable as a remedy." So, says the Prime Minister, the tenant had security of tenure, and you took it from him. That any sane man should consider a measure facilitating the exertion by one party of his acknowledged rights as a disabling one against the rights of another seems as strange a topsyturification of reasoning as can well be imagined. But it is all one to Mr. Gladstone. No matter how such an argument may be warped and misused in future, if it will serve his turn to procure his present purpose, that is all that he cares about. And so it has always been with the Government; and so, probably, it always must be with a Government resting for support on a heterogeneous party, the sections of which require each its sop in turn. The sop must be given, no matter at what expense; the post-obit signed, no matter on what ruinous terms. And, indeed, if must be admitted that, in respect of this means of raising the wind, Governments have great advantages. For it is not at all improbable that the

bond will never fall due in their own time, and that some one else unconnected with them and for whom they have no love, will come in for their liabilities. The post-obit only becomes payable after their own death, not after that of some one else. The country, indeed, pays in any case; but who cares for the country?

BEACONSFIELD.

IT is a strange caprice of fortune which has linked an obscure little town in Buckinghamshire with three such names as Waller, Burke, and Disraeli. If we add that of Sir Gore Ouseley, the association with literary and political eminence is one that few localities in England can rival. Utterly insignificant in itself, a mere village of the larger sort, listless and depressed, without trade or manufacture, with nothing but the beauty of its situation and the picturesqueness of its buildings to recommend it, the name of Beaconsfield has long been famous, both in political and literary history, and in connexion with the distinguished statesman and author whose recent death has left such a sensible blank on the stage not of England only but of Europe, has of late years attained a world-wide celebrity denied to hundreds of other towns greatly its superior, both in size and importance. And it is, as we have said, by a kind of caprice of fortune that this celebrity has been thrust upon Beaconsfield. For, with the exception of Waller, all those who have contributed to make Beaconsfield famous have had only an adventitious connexion with the place, such as might have been formed with any other town or village in the kingdom. The tie with the Waller family was a substantial one. The manor of Beaconsfield, which had at one time belonged to the neighbouring abbey of Burnham, passed to the Wallers at or soon after the Dissolution, and remained in their hands till within living memory. The association of Burke with the little town is simply due to the fact of his being member for the adjacent borough of Wendover; and, finding a portion of the Waller estate, with a good house upon it, for sale, he became its purchaser, and made it his chief residence until his death in 1797. In the same way, Sir Gore Ouseley, at the close of his brilliant career of Oriental service—in which, as Ambassador Extraordinary and Plenipotentiary at the Persian Court, he had successfully negotiated a treaty between England and the Shah while Russia was in alliance with France, and afterwards, in the same capacity at the Court of St. Petersburg, effected a pacification between Persia and Russia, securing at the same time, not the confidence only, but the friendship, of the Emperor Alexander and the Shah—when seeking a place of well-earned repose, Hall Barn, the Wallers' mansion, being in the market, bought it with the estate and made it the home of his latter years. The late Premier's connexion with Beaconsfield was more shadowy still. Indeed it was merely nominal, based on sentiment, not on fact. Hughenden is nearly ten miles distant; and we believe we are correct in stating that Lord Beaconsfield never possessed a single square yard of ground in the place which gave a title to his wife and himself. The motive for its selection, as is well known, was that the peerage designed by George III. for Burke, before the premature death of his only son rendered such hereditary honours a ghastly mockery, was to have taken its designation from Beaconsfield, and Mr. Disraeli, with that romance with which he loved to throw a brilliant mirage over the commonplace and the actual, chose, when he had to select a title for his wife, to emphasize his connexion with the county associated with his chief Parliamentary triumphs, and at the same time indicate his admiration for the character of the great statesman whose footsteps he not altogether unsuccessfully endeavoured to follow. The Viscountess Beaconsfield of course settled the style of the earldom.

The etymology of Beaconsfield seems obvious enough, and its elevated position supports the ordinary derivation. But such instances as "Bridgwater" (*Burgh Walter*), and "Beachy Head" (*Beauchef*), which might be multiplied indefinitely, prove that the obvious is not always the true in local etymology. It is more probable that "Beaconsfield" has no connexion with the site of a beacon, but, going much further back, like Oakfield, Ashfield, &c., indicates a clearing in the dense beech woods (*bēcenfeld*) which once covered the whole Chiltern range. The ordinary pronunciation of the name, as well as its old spelling, corresponds with this. No native ever speaks of *Beākonsfield*; in their mouths it is always *Beekonsfield*. This, too, is the earlier form of the name. The *a* is a modern introduction. The title of the original edition of Waller's poems, published during his exile in 1645, is "Poems, &c., by Mr. Edmund Waller, of *Beekonsfield*, Esq." Still earlier it appears as *Beekonsfield*.

Apart from its associations with the great departed and its own natural beauty, Beaconsfield, as we have said, has few claims to notice. Perched on the flat top of one of the Chiltern ridges, surrounded by sinuous chalk valleys watered with crystal streamlets hurrying to the Thames, their steep sides clothed with the woods of beeches—*beechen*, in Anglo-Saxon—with their tall glistening boles and spreading branches, from which, according to Camden, the county of Buckingham, like Buckhurst and Buckland, and not improbably the town itself, derives its name, and furrowed with deep lanes, their high chalk banks fringed with clematis and eglantine and every kind of gracious plantage, spangled with primroses and violets and lady'slocks, and every flower that our old poets loved and sung of, commanding a wide view in all direc-

tions, towards Wycombe, and Penn, and Amersham, and Bulstrode—famous in Mrs. Montagu's letters—round to Wooburn and Marlow and the valley of the Thames, the natural attractiveness of Beaconsfield is such that we cannot be surprised that those who had the means of choice should select it for their home. The town itself is a very pretty one. The single main street of which, like most Buckinghamshire towns, it chiefly consists, is singularly broad, with a row of trees on either side, and the houses are many of them ancient, of varied outline, and remarkably picturesque. Left on one side by the stream of railways, modern improvement has scarcely touched it, and the lover of England as it was in old days will find much to delight him at every step. The former Rectory, if not, as is sometimes said, the oldest parsonage in England, can have very few to antedate it. Begun about 1500, when Richard Capul, the then Rector, bequeathed 40*l.* towards its building, and finished by Richard Rawson, who died Canon of Windsor and Archdeacon of Essex, in 1543, the house can boast of an antiquity of between three and four hundred years, and is one of the most perfect and unaltered examples of its date. It encloses three sides of a quadrangle, having a high wall and gateway on the fourth side. The basement is of chequered brick; the upper story with its steep roofs broken by lofty gables and dormers, is of huge timbers plastered between. The principal staircase attached to the north side, enclosed in a semi-cylindrical turret of timber, presents a most picturesque feature. One cannot enter the house without being struck with the immense waste of timber, according to modern ideas, in its construction. Solid trunks are framed in dark passages, and built up in partitions where thin planking would be deemed sufficient by modern builders. The floors are of enormous thickness, and the steps of the staircases are of huge blocks roughly squared with the axe. The whole building is so characteristic of its age that it could hardly have failed to impress itself on Disraeli's mind if he had ever visited it, and to appear in one of his romances. Though described by the veteran architect Mr. J. C. Buckler more than forty years ago in his *History of Eltham Palace*, it seems to be almost unknown. Strange to say, it finds no place in Mr. J. H. Parker's *Domestic Architecture*. We are happy to say that though untenanted, save by the Rector's groom, it is still well cared for, and we hope that so precious a relic may be long preserved. The "Saracen's Head Inn," with its long gabled fronts, before which the turbaned Saracen glares down the now empty street from his tall signpost, as it used to glare at the numberless Oxford and Cheltenham four-horse coaches and the dusty postchaises that once filled the town with life and bustle, is another excellent specimen of architecture. There are other houses with stone-mullioned bow windows, and hooded scallop-shell porches, and other charming details enough to employ the pencil of an architectural sketcher for a long sunnier day.

The church, which stands in a little square in the centre of the town to the south of the main street, is a very pleasing edifice, partly Early English in character, with a noble flint and stone square tower of late Perpendicular crowned with a taper wooden spire, at the west end. We can remember it neatly whitewashed, its arches blocked with flying pews, and its area crowded with clumsy deal boxes of various shapes and sizes. Now it has been subjected to a well-directed restoration under Mr. Woodyer, whose name will reassure the most sensitive anti-restorationist. The tower has lost its battlement, which at one time it was hoped might be rebuilt, and the bells rehung, as a memorial to Edmund Burke, who used to worship regularly in the church. But "a living dog is better than a dead lion," and not even the name of Edmund Burke, one of the noblest in our history, who, in Mr. Morley's words, possessed "the sacred gift of inspiring men to use a grave diligence in caring for high things and in making their lives at once rich and austere," and who adorned our literature with, in Macaulay's estimate, the grandest prose writings since Milton, could awaken sufficient enthusiasm, and the tower remains incomplete. Burke is only commemorated by a brass plate over his grave in the nave and a mural tablet on the outside wall of the south aisle, which bears also the memorial of his brother Richard, the Recorder of Bristol, and of his dearly loved son, "the adored centre of all his father's hopes and affection," whose death in his thirty-fifth year, August 1794—Cromwell House, Brompton, not Beaconsfield, was the place of his decease—made the small remnant of the old man's days desolate and void, leaving him, in his own touching words, "like one of those old oaks the late hurricane has scattered, torn up by the roots and prostrate on the earth." The broken old man survived his son less than three years. Shortly before his death, he visited Bath for the waters, but to no purpose, and he returned to his house at Beaconsfield to die, but to no purpose, he wrote to Mrs. Leadbetter, "to a habitation more permanent, humbly and fearfully hoping that my better part may find a better mansion." He died July 9, 1798, in his sixty-eighth year. With magnanimous forgetfulness of past differences, Fox proposed that Burke should receive a public funeral in Westminster Abbey. But, to complete the closeness of the parallel, he had left the strictest injunctions that he should be buried in the same grave with those whom he had loved best—Mrs. Burke survived him some years—and that his funeral should be private. This latter part of his directions it was found as impossible to carry out as in the case of Lord Beaconsfield. The funeral was a walking one, the body having been removed from his mansion at Gregories to the house of Mrs. Salisbury Haviland, in the town of Beaconsfield, and was characterized by the greatest simplicity. But the crowd that assembled to testify their veneration for the departed

statesman was immense. All the leading members of both Houses, together with the gentry of the neighbourhood, attended in person, or sent their carriages, the pall being borne, among others, by Lord Chancellor Loughborough, the Speaker Addington (afterwards Lord Sidmouth), the Duke of Portland, Lord Minto, and Mr. Windham. Among the most real mourners were the boys of the school established by him under Abbé Maraine in 1794, by a subsidy from the Government, for the orphans of Quiberon and children of destitute French *émigrés*, at the neighbouring village of Penn. This charitable effort somewhat brightened the deep gloom caused by his son's death. Burke, like Diarlei, always loved children, and was at home with them. Mackintosh, who gives us the last glimpse of his daily life, when on a visit the Christmas before his death, speaks with amazement not only of the exuberant fertility of his host's conversation, but also of the *abandon* with which he entered into the sports of these boys, sharing with cordial glee in their games, and rolling with them on the carpet, pouring out in his gambols the sublimest images mixed with the most wretched puns. He watched over these orphans, we are told, like a father, and vexed his housekeeper's heart by surreptitiously sending them haunches of venison and other delicacies intended for titled guests. But with all his kindness, Burke was a staunch advocate for corporal chastisement, when needed. This he told the tender-hearted Abbé, who shrank from the use of the birch, was "our chief receipt for turning out great men." After the restoration of the French monarchy the school was supported by Louis XVIII., and was not finally dissolved till 1820.

The house occupied by Burke, known as Gregories, from a City magnate of that name who built it, but more properly called Butler's Court, stood a little to the north-west of the town of Beaconsfield. It was purchased by Burke for above 22,000*l.* in 1768, and he spent a considerable sum in enlarging and improving it, taking as his model old Buckingham Palace. Like that, it was a stately house of red brick, with white stone dressings, consisting of a centre connected with wings by curved Corinthian colonnades. When he bought it, the house was "hung from top to bottom with pictures," and he commissioned Barry, the artist, to whom, with unthinking Irish generosity, he was allowing a yearly sum for travel and study, at the very time that he himself was forced to apply to Garrick for a loan of 1,000*l.* to purchase fresh pictures, statues, and objects of *virtu*, to make the collection more perfect. A year after Mrs. Burke's death it became a school, and was burnt down April 23, 1813. Nothing remains to speak of its former greatness but the piers of the gateways, the stables, and other out-buildings. The forlorn and neglected shrubberies still bear the name of Burke's Grove. The identical dagger which—with execrable taste, it must be confessed—was thrown down by Burke on the floor of the House of Commons when denouncing a "Regicide Peace," is still preserved in the house once occupied by Mr. Rolfe, Burke's bailiff and factotum, whose son, the late Mr. John Rolfe, when a sturdy infant, was the original of Sir Joshua Reynolds's "Infant Hercules strangling the Snake," purchased after Burke's death by the Empress Catherine, and now at the Hermitage Palace. In the lawns and fields around he used to feed the poultry, fluttering and cackling around him as soon as he made his appearance, with the corn with which his pockets were stuffed, and lavished tokens of affection on the cattle, especially on the old horse, which had been his son's favourite, "throwing his arms round its neck," writes Prior, "he was seen to weep long and loudly." Unlike the ex-Premier, Burke had an aversion to peacocks, on account of their vanity and affectation. Here he received Dr. Johnson, exclaiming, as he traversed the grounds, "Non equidem invidio, miror magis," and took the poverty-stricken poet Crabbe into his family circle, "raising him from destitution to independence." There is an engraving of this historical mansion appropriately prefixed to one of the volumes of Crabbe's collected works. The purchase of Gregories was not dictated by the same prudent forethought as that of Hughenden by the ex-Premier. Burke had neither funds to pay for it nor to maintain it. The scandalous stories propagated by his political enemies as to the way in which the purchase money was raised have been proved to be gross calumnies. But it was a rash venture for a man with only a legacy of 2,000*l.* from his brother at his command to purchase for above 20,000*l.* a house and estate, requiring at least 2,500*l.* a year to maintain it. Of the purchase money 14,000*l.* was left on mortgage, and 6,000*l.* was advanced by Lord Rockingham on Burke's bond. But we cannot be surprised that the great man was ever afterwards in pecuniary difficulties, and that, while his debt to Lord Rockingham swelled gradually to 30,000*l.*, all generously cancelled on his demise, beggary stared him in the face at the time of his son's death, and he was only saved from absolute penury by a royal pension of 2,500*l.* It was among sombre shadows, both private and political, that, in Mr. Morley's words, "a life went out which, notwithstanding some grave aberrations, had made great tides in human destiny very luminous."

The most conspicuous object in the churchyard of Beaconsfield is the huge mausoleum, crowned with obelisk and vases, of another Edmund—Waller the poet. He, like Burke and Diarlei, united the political and literary life, and obtained no little celebrity in both, though in the former walk it was a distinction of a far from an enviable character. As a poet, though some of his compositions are still remembered with pleasure—his "Go, lovely Rose" especially is a poem that will not soon die—he belongs to the same class as Sidney and Cowley, who, as Mr. T. H. Ward has remarked, "once famous in their day, and playing a great part in

English literature, have faded from public notice, and are no longer generally read." The greatest blot upon his character as a writer is the facility with which he prostituted his muse to flatter all whom the vicissitudes of the world happened to exalt, whether Cromwell or Charles II. On the latter tanning him with the inferiority of his verses on his restoration to those written in laudation of the Lord Protector, he is said to have adroitly replied, "Poets, you know, Sire, always succeed better in fiction than in truth." As a politician, his career was rendered contemptible by the pliancy with which he adapted himself to the changing sides of revolution, and secured for himself, not only a seat, but a ready hearing, in nearly every Parliament, from the day that he entered the House of Commons as member for Amersham—"non dum octodecennarius," his epitaph tells us; some authorities say he was hardly more than sixteen—through the reigns of James I., Charles I., and Charles II., until, in his eightieth year, he was returned to James II.'s Parliament in 1685, still charming the House by the sweetness of his eloquence, his conciliatory address, and exquisite composition of his sentences. He once grossly miscalculated his opportunities, when, in June 1643, he concocted the feeble plot, which still goes by his name as "Waller's Plot," for seizing the Tower, letting the King's forces into London, overpowering the Militia, and dispossessing the Parliament. But while his companions Chalmor and Tomkins (his brother-in-law) were executed as traitors before their own doors in Cheapside and Cornhill, Waller saved his life by turning informer, involving even ladies in complicity with his wretched conspiracy; and after having earned universal contempt by his cowardly bearing and the hypocritical penitence exhibited before the Bar of the House of Commons, compounded for his treason by a fine of 10,000*l.* and a sentence of exile. This last part of his punishment he afterwards wheedled Cromwell into remitting, and returning to England he lived in high repute at Hall Barn safe through all political storms, almost within sight of the Revolution of 1688, dying full of wealth, honours, and days, on October 21, 1687, leaving thirteen children behind him, and having a panegyric epitaph composed for his tomb by Dryden of the *Fædora*, in which, among other conceits, we read that he made his tongue so dear to the Muses that, if they gave up Latin and Greek, they would speak no other language but English.

THE FEUD OF REGULAR AND SECULAR CLERGY.

THE *Times* reported a few days ago that a Bull regulating the relations between the Roman Catholic Bishops and the Religious Orders in England had already received the Papal signature, and was shortly to be published. Meanwhile the telegram recounts under nine heads the principal provisions of this final settlement of a question which is known for some years to have been greatly exercising both the Vatican and the English prelates who had appealed to its judgment against the encroachments of their unruly subjects—if indeed they could be called subjects—at home. With the particular details already communicated of this Papal ordinance, which will be chiefly interesting to those immediately concerned, we need not trouble our readers. It may be enough to say that the general principle underlying them is one consonant, we presume, with traditional precedents, and which certainly appears to be agreeable to common sense. So far as can be discerned, the regular clergy or monks are left pretty much to themselves—that is to the control of their own superiors, under appeal to Rome—in all that concerns their own internal discipline and life, but if they undertake parochial work, they are to be subject "in what concerns the cure of souls and administration of the Sacraments" to the bishop of the diocese, nor can they assume or retain any such charge except by his appointment. All this seems reasonable enough. And there have, we believe, been many difficulties and heartburnings for the want of an observance of some such simple rule. But what naturally strikes an outsider, in regard to the elaborate code or revision of code found necessary in the latter half of this nineteenth century for preserving peace between the two sections of the not very enormous body of Roman Catholic clergy in England, is the obvious reflection that, in ecclesiastical as in other matters, history repeats itself. The standing feud between secular and regular clergy is as old as the foundation of religious orders, and therefore almost as old as the Church itself. Hallam, in speaking of the literature of the fifteenth century, says that the secular clergy, divided among themselves, were agreed in detesting the regulars, while "the regular monks satirized the mendicant friars, who, in their turn, after exposing both to the ill will of the people, incurred a double portion of it themselves." And he adds that the literature which embodied these enmities, by loosening the bonds of ancient association, paved the way for changes of speculative opinion, and thus indirectly served the cause of the Reformation. And this is perfectly true. When indeed the disputes of seculars and regulars are alleged by too eager controversialists in proof that there is no real unity of belief in the Church of Rome, the inference is sufficiently absurd, for their differences have no bearing on any question remotely concerning doctrine; but the differences themselves are not the less real and lasting, and they did of course contribute something to the general break up of medieval religion. Nor is the old feud, however carefully disguised now that there are Protestants to be scandalized as well as Catholics, by any means extinct; perhaps it is hardly less bitter than in former

ages. About twenty years ago a distinguished Jewish convert, who had become not only a Christian but a Carmelite monk, opened a public church in a large town parish, where the secular clergy were already established. The Roman Catholic population was considerable, and there was presumably quite room for two places of worship for them; indeed they were at the time preparing to build a new one; but it was of course inevitable that the establishment of a monastic church should act more or less as a drain on the resources of its secular rival. "Father A."—was reported to be the indignant exclamation of the outraged and invaded *parochus*—"Is no doubt a priest and a monk, but for all that he is a Jew still, in all but his baptism." So it almost looks as if, to use Hallam's words, "the secular clergy detested the regular" as heartily as ever still. The old Aristotelian proverb *ὁ κρημνὸς ἀνέπαυτος* would perhaps go some way to explain this, but a very cursory glance only at Church history suffices to reveal other and more special reasons for the chronic jealousy between them.

The differences of Latin and Eastern monasticism, based on the characteristic differences, ethical and historical, of the two Communion, are at once deep-seated and conspicuous. It would be difficult to find two forms of life bearing a common name, and distinguished by the same universal vows of "poverty, chastity, and obedience," more widely diverse in character and practical result than the manifold activities, say, of a Benedictine or Franciscan community of the middle ages on the one hand and the passive abstraction of the old Egyptian Laura or the dull illiterate routine of the monasteries of Mount Athos on the other. During a period of some fifteen centuries scarcely a variation of external rule or internal life has passed over the cloistral solitude of "the changeless East." Empires, dynasties, civilizations, religions—such as Islam, itself an Eastern product—have risen or passed away; the very existence of Christendom has been menaced from without, and its unity once and again has been broken from within; but the slow lapse of ages has brought to those living sepulchres no revival of dormant energies or dawning of a clearer light. Eastern monachism has lasted at least from the days of St. Antony to our own, but it reckons no Benedict, or Francis, or Ignatius among its legislators, no Abelard or Aquinas among its theologians, no Anselm or Bernard among its saints. It has been left to the casual enterprise of Western scholars to exhume from time to time by some lucky accident the buried treasures consigned to moths and worms in the deserted libraries of Mount Athos or Mount Sinai, while Western monks alone have carried out into a hundred various ramifications of active and intellectual energy the monastic idea originally borrowed from the East. If there has been no feud between regulars and seculars in the East, that is chiefly because, except at one point, there has been next to no contact between them; their isolation has saved them from hostility. There is one exception however; Eastern bishops being bound by the rule of celibacy, while the parish priests are bound to be married, are taken exclusively from the monasteries, and they are said in consequence to be usually very much out of sympathy with their diocesan clergy, as is natural in the circumstances. But the very activity of the Latin monks, which has brought them into the thick of the fray, and mixed them up with the general course of ecclesiastical and civil history, has also brought them into active and jealous competition with their rivals of the secular priesthood. The two orders are sometimes designated by theologians "the two eyes of the Church," but their range of vision is certainly not always identical. This arises partly, as was observed just now, from the nature of things, partly from a cause by no means discreditable to the religious orders. Benedictines, Franciscans, Jesuits, and other "reforms," as they were often called, of the monastic institute, came forward, each in its turn, as a protest against existing corruptions and the consecration of a renewed energy in the field of spiritual labour. Their appearance was at once a rebuke and a challenge to the lazy or corrupt pastorate of the age, and in proportion as a rebuke is deserved, it is likely to be resented. It is true that too often in course of time the reformers themselves came to stand pre-eminently in need of reformation, and the gurgyles and misereere seats of our old churches and cathedrals bear abiding and amusing witness to the uncompromising sharpness of the hints administered to them by their rivals. But there was one peculiarity of the monastic institute, neither creditable nor discreditable in itself, which grew indeed out of that rivalry, but also served, and serves to this day, enormously to accentuate and augment it.

The new Bull about to be issued on the relations of secular and regular clergy in England deals entirely with the conditions and limitations of the exemption of the regulars from episcopal control. And this exemption has all along lain at the root of the contention between them. The earliest example of such a papal exemption is said to have occurred in 455, under Leo the Great, first of the chief founders of the Papal Monarchy, but it did not become frequent till some centuries later. Pope Zachary, in the middle of the eighth century, revived the practice, which thenceforward was very generally followed. Muratori however thinks exemptions of monasteries from episcopal visitation were not common in Italy before the eleventh century, and that many of the earlier Charters are forgeries. Some English antiquaries similarly contend that no Anglo-Saxon monastery was exempt, and that the first instance of a genuine charter of Exemption in this country is that of Battle Abbey in the reign of William the Conqueror. Certainly such exemptions were very common in England afterwards. And it must in fairness be admitted, as Hallam points out, that the bishops had often

assumed an arbitrary even tyrannical power over the clergy, both regular and secular, of which constant complaints were made, as may be learnt from the Acts of contemporary Councils. Guizot calls attention to the fact in his *History of French Civilization*. But the regular clergy, who had the countenance of Rome, and very often of the public opinion of the day also, at their back, were able to make a more successful resistance than the secular, and it suited the purpose of the Papal Court to include those exemptions of an order of men on whose devoted service it could always securely reckon in the general scheme of steady and gradual encroachment on episcopal authority it was engaged in carrying out. And in the eighth and ninth centuries a ready excuse for this policy might be found in the comparative superiority of monastic over episcopal morality. At that period, according to Guizot, the Church had sunk into a state of disorder hardly less marked than that of civil society, and the bishops, with little control to fear from any quarter, set free (through the new discipline of the false decretals) from the surveillance of their metropolitans and of provincial Councils, were apt to indulge in scandalous excesses. The monasteries, on the other hand, were usually at least respectable, and thus could urge a strong moral claim to exemption from an interference more likely to prejudice than to promote their efficiency.

We need not trace out the further course of the history in detail. When the principle was once established motives good and bad would alike conspire to foster its maintenance and extension. In her long struggle for supremacy Rome could not lightly reject the services of auxiliaries all of whom were in their measure fairly entitled to the designation, afterwards arrogated to themselves by the Jesuits, of the prætorian guard of the Papacy. On the other hand, in view of the ugly and reiterated indictment against the secular clergy, chiefly of simony and incontinence, prominent in the annals of nearly every mediæval Council, it might fairly seem incumbent on the Pope not to turn a deaf ear to men like Dominic, or Francis, or Ignatius, who offered him "the promise and potency" of a great spiritual development and renewal. The Council of Trent, which reformed many things, though it did not reform the doctrines abhorrent to Luther and his adherents, made a tolerably clean sweep of clerical scandals at least in Europe, but the long standing feud of seculars and regulars was not therefore destined to be healed. No previous order indeed or combination of orders ever attracted to itself one-half the jealousy and antagonism provoked by the "Company of Jesus," whose very name was interpreted into an arrogant and intolerable assumption of superior excellence. Moreover the Tridentine decrees had just strictly forbidden the creation of any new orders, and the prohibition has never been infringed. But there are ways of driving a coach and six through inconvenient enactments without directly infringing them, and under the varied alias of "Society," "Congregation," "Institute," and the like, new Communities preserving all the distinctive characters and privileges of the old Orders have multiplied more rapidly during the last three centuries than at any previous period of Church history. And as all these new organizations are rather of the "active" than the "contemplative" type, they all come inevitably into contact, and therefore sooner or later into collision, with the secular priesthood. One of the latest of them, founded in Italy some forty years ago and soon afterwards introduced into England, was expressly designed to share, and thereby elevate and improve, the work of the parochial clergy. And in a country like this, where the supply of priests "for the mission" is sure to fall short of the exigencies of the case, the Roman Catholic Bishops can least of all afford to dispense with the proffered aid of volunteers, whose education has cost them nothing, who have resources of their own to fall back upon, and whose culture is usually of a higher type than the diocesan seminary can bestow. But the aid is accepted not without reserve and misgiving. Over the secular clergy the Bishop exacts an absolute, not to say arbitrary, control; but he knows that the regulars own at best a divided allegiance, and regard him rather, as a recalcitrant Ritualist is supposed to look on his ecclesiastical rulers, as a power to be reckoned with than as a superior to be obeyed. And hence arose the need for this elaborate concordat between the rival jurisdictions which adds one fresh chapter to the long and not uniformly edifying record of the conflict of seculars and regulars in the Latin Church.

DIE MEININGER.

THE company of the Court Theatre at Saxe-Meiningen has no- quired a remarkable and peculiar reputation in Germany. This is due not merely to the excellence of the performances in their own theatre, but to those which they have given in Berlin, Dresden, Vienna, and other cities. It is a common custom in Germany for single actors to be invited to join other companies for a few weeks, when they are called "guests," in order that they may play the parts in which they have acquired the greatest distinction at home. In the case of the Meiningen Theatre, however, it is not single actors who make these friendly expeditions to other places, but the entire company, so that "Die Meiningen" have come to be spoken of collectively, as a body of persons governed by a particular system, and animated by a common purpose. In fact, so far as we are able to judge, their visits to German towns are regarded, both by themselves and others, as missionary enterprises, the object of which is the improvement of

the stage. Reformers, especially those who wear their badges openly on their sleeves, are usually regarded with suspicion, if not with dislike. The Meiningers, on the contrary, have become extraordinarily popular. Wherever they go, the theatre is crowded, not once merely, but night after night, so long as they can be prevailed upon to stay; and they are usually pressed to repeat their visit at the earliest opportunity possible. Up to this time they have never played out of Germany. Now, however, they are about to give a series of performances at Drury Lane Theatre. It will therefore be interesting to examine the objects which they have in view, and the peculiarities which distinguish them.

When the present Grand Duke succeeded his father in 1866 he found a company at the Hof-Theater neither better nor worse than in other German towns of the same importance. It was, as is customary, a double company, giving operas and plays on alternate evenings. The Duke, however, actuated by a laudable desire of doing one thing well, soon made up his mind to abandon opera, and to devote his energies to the representation of plays as completely as the resources and limits of the stage will allow. The condition of the German theatre, so he thought, was not satisfactory. Modern pieces, such as translations of popular French novelties, light comedies and farces, might be put on the boards as well as they deserved to be; but the higher forms of the modern drama, the classical masterpieces of Germany, and the plays of Shakespeare, whom, as is well known, the Germans have adopted and made their own, were performed in a very slovenly fashion. It needed a very critical eye to perceive this. Englishmen who have had the good fortune to see *Faust* or *Hamlet* at one of the great German theatres have rejoiced that there was still a stage on which poetical plays could be represented with respect to the author's own intention, without curtailment from deference to the habits of the audience or some stupid tradition of the stage, and, as it appeared to them, with far greater attention to details and to the adequate presentation of the minor characters than is possible in England. The Duke of Saxe-Meiningen, however, thought otherwise. It appeared to him that, while one or two parts were entrusted to actors of talent, the rest were neglected; that the scenery was too often inappropriate; and that the costumes and accessories lacked historical accuracy. He, therefore, set to work to correct these defects in his own theatre. In every play produced there the same pains was to be bestowed on the small parts as on the great ones. Self-assertion on the part of any member of the company was not to be thought of. It is one of his principles that there should be no "supers" in his theatre, only actors and actresses, any of whom must expect, if need be, to be called upon to take the smallest parts. When a piece has been selected for performance, the principal parts are first studied under his own direction, and often in his own presence, until he is satisfied; after which the different scenes are gradually put together and rehearsed over and over again, always with the scenery and all the persons, whether speaking or silent, who are to appear in them, so that complete harmony may be produced, and everybody, small as well as great, may feel their responsibility in the perfect realization of the picture. By this means carelessness and listlessness on the part of the lookers-on is avoided. They are made to understand that gestures may be as eloquent as words, and that each member of a crowd ought to possess a distinct and definite individuality while taking part in a common action. In consequence, the throngs that fill the stage in such plays as *Julius Caesar*, *Fiesco*, and *Wallenstein's Camp* (all of which are to be given in London), are said to be quite wonderful in their reality, and in the way in which varieties of nationality and motive are indicated. We hear on all hands that the result justifies the labour that has been bestowed upon it. "Work," says the Duke, "is the secret of the Meiningers' success"; and the verdict of German audiences is wholly in his favour. Wherever the Meiningers perform they leave their mark behind them by stimulating audiences to demand, and managers to attempt, increased efficiency in these really important matters, which are too often regarded as accessories, upon which neither time nor thought need be expended. It must not, however, be supposed that the abolition of the detestable star-system has rendered the performance of any great work inadequate. If no performer be pre-eminent, on the other hand, no one is admitted who is inadequate. The average is remarkably high.

Again, it is held at Saxe-Meiningen that the closest union ought to subsist between the actors and the decorations. No detail can be so inconsiderable as not to have some influence on the tone of the whole picture; and the effect of the actions of the principal personages will be heightened when the scenery is brought into harmony with it. In this department, therefore, the utmost attention is paid to accuracy of detail and to local colouring, so as to present to the audience an exact realization of the place in which the action may be supposed to pass. At the same time, care is taken that the scenery should not in any way override the actors, but form, as it ought to do, a rich and suitable background to them. Similar care is taken that the costumes and the furniture shall be of the exact period indicated in the play. In many cases real articles are made use of, as in Kleist's drama, *Das Kütchen von Heilbronn*, where the knights appear in suits of armour that have been handed down from the middle ages. The elaboration of the scenery has, no doubt, one drawback, and that a considerable one. It necessitates an employment of the drop-curtain so frequent that even the warmest admirers of the Meiningers admit that it is wearisome. *Julius Caesar*, for instance, which ought to be played in five acts, is really played in

eight, and *William Tell* in fourteen. However, not even this defect, which German audiences, who like to get their play over early, must find particularly irksome, has diminished the success of the Meiningers in their own country. Even in Vienna, where a strong taste for dramatic entertainments is co-existent with an equally strong predilection for early hours, the Meiningers won golden opinions. One of their critics, a Viennese, and a warm admirer of his own Burg-Theater, which he regards as second only to the Comédie Française, even if it be not in some ways superior to it, cordially admits their great excellence; and especially proclaims to his countrymen that their attention to details and their power of realizing the whole scope and object of a play enabled them to succeed even where the Burg-Theater had failed. He dwells especially on their performance of Grillparzer's drama, *The Ancestress* ("Die Ahnfrau"), which we shall have an opportunity of seeing in London. The very scenery seemed haunted by the weird mysteriousness of the poet's conception.

We have already mentioned that the Duke's primary object in thus devoting his time, energy, and resources to the improvement of the stage was to represent German masterpieces more completely than had hitherto been done. This idea explains the somewhat limited character of his repertoire. If a play be adequately performed at other German theatres, he does not think it worth while to produce it at Saxe-Meiningen. For this reason *Faust* is rarely given there. Again, his peculiar system induces him to perform elaborate plays, with numerous characters and many supernumeraries, rather than those where a single personage dominates the action. Hence the exclusion of *Wallenstein* and *Hamlet* from the London programme—omissions which, we confess, we particularly regret. We wish, too, that some modern comedies could have been given here. Such are given occasionally at Saxe-Meiningen, and would not only have relieved the somewhat sombre tone of the rest of the pieces selected, but would have enabled us to judge of a branch of German literature but little known in England. We are glad to hear that the two comedies by Molière set down in the programme will probably be replaced by the *Taming of the Shrew* and Goethe's one-act play *Die Gezeichneten*. The former will be given from the text of Shakespeare, and will, no doubt, be one of the most interesting features of the visit. The plays chosen, however, though it is easy to find fault with the selection, will all be very interesting, especially as the result of the system the outlines of which we have attempted to sketch. We wish the company all success. The labour of moving so large a body of persons, with all the supernumeraries, the scenery, the furniture, and the accessories (without which the Meiningers never travel), must be so great and so costly that we almost wonder the Duke ventured to undertake it. Fortune is said to favour the brave. Let us hope that she will do so on this occasion.

THOUGHT-READING.

WE are tempted sometimes to doubt whether our civilization is not after all an elaborate sham, and whether it would not be more honest to return to the primitive coat of blue paint and practise our fetishism in an open and straightforward manner. At any rate, it is very difficult to detect any great difference in principle between the pretensions of savage "medicine men" and the various crazes, such as mesmerism, spiritualism, transcendental physics, and the like, which have been in vogue during the present generation. With us, as with our humbler brethren of Africa and elsewhere, the motives which lead to these practices are as various as the methods employed. They are supplied sometimes by a genuine but hopeless desire to attain the impossible, to induce the natural order of things to accommodate themselves to our own convenience, or by a vague yearning to see into futurity. Another, and by far the most frequent, cause is the desire to profit, through deliberate imposture, by the weakness of one's fellow-creatures. But yet another motive exists, and that is vanity, which induces the would-be seer to mistake his own fidgety excitement for supernatural inspiration, and compels him to delude himself as well as others. This is the most dangerous of all the forms of modern miracle-working, for the "seer" or "healer" may be perfectly honest in the belief in his own powers, and his claims may be, and indeed always are, more or less borne out by the effect of his own excitable temperament upon that of others. This is the secret of "electro-biology" and other now exploded quackeries; for you have only to persuade an emotional person that he either cannot or must do a certain thing, and his nerves and muscles unconsciously obey the impulse of his will, although the suggestion that has set that will to work comes from another. Scientific men whose lives are spent in investigating the intricate mechanism of nature, especially that delicate arrangement of matter which makes up a living and thinking human being, are naturally attracted to these phenomena; and when a really honest person comes before them, claiming to do something extraordinary, and really doing something which they cannot understand or account for, a very nice "nine days' wonder" indeed is the result. But, as we have had occasion to remark in these columns when speaking of "modern magic," whether of the spiritism or prestidigitation type, scientific men do not make at all good observers at such exhibitions. This is certainly not as it should be; for, knowing as well as they do

the limits of the natural, they should begin by assuming that what they see, or think they see, cannot be done, and should next look for the fallacy—the unnoticed break in the chain of evidence—which apparently separates the occurrence from the ordinary operations of nature. What scientists, however, as a rule, do in such cases is to try to account for the “supernatural” appearance by natural laws, instead of endeavouring to ascertain what it was that has wrung from them their testimony to its occurrence. In nine instances out of ten it would be found that the miracle-monger has—perhaps quite involuntarily—made a *temps*, and thrown out all their calculations. A *temps* is a technical term in conjuring, and signifies any act by which the attention of the audience is drawn off the performer while he is doing something which he does not wish them to see, and by which they are made to believe that the act takes place at a time when he is, in fact, quite passive. It may be aptly illustrated by the old melodramatic trick when the first murderer requests the virtuous hero to “observe the flight of yonder solitary crow,” and sticks him in the back when he turns his head for the purpose.*

We are led to make these remarks because the daily papers have been lately full of an affair which, if not dispassionately discussed from a common-sense standpoint, is likely to add one more to the already too-long list of popular crazes about the “supernatural.” The other day a select party, consisting of some of the men most distinguished in physical and mental science, met to witness an exhibition by Mr. Bishop of his “remarkable power of thought-reading.” Dr. W. B. Carpenter and Professor Huxley appeared as his sponsors, and testified to their own experience of Mr. Bishop’s wonderful faculty, “which he derives from the careful study of the indications unconsciously given by the subjects experimented upon, and his peculiar aptness in interpreting those indications.” Now it is only fair to say that this is a reasonable and plausible account of what Mr. Bishop, or any one else with keen powers of observation, may do; but what we object to is the folly of bringing a dozen scientific men together to investigate what is, after all, a very common conjuring trick. No doubt Mr. Bishop, as we are assured, has no intention of making any pecuniary or other gain out of his powers, which he simply exhibits as “an interesting contribution to the study of psychology”; but he must forgive us if we do suspect him of taking a very undue estimate of the rarity or value of his talent. The first “experiment” consisted in Mr. Moncure Conway’s hiding a bundle of tickets, when the performer, who was led blindfold into the room, seized Mr. Conway’s hand, “and pressing it against his forehead with much excitement of manner,” raced about the room with him until the hiding-place was discovered. Then Professor Ray Lankester complained of a pain, and the “medium” correctly indicated that it was a tooth-ache by laying his hand upon the sufferer’s cheek. Dr. Lyon Playfair next took part in this somewhat undignified game of blindman’s-buff. Some cards with the letters of the alphabet printed upon them were hung upon a string, and Dr. Playfair having thought of the word “Speaker”—which, by the by, he probably thinks a great deal about—Mr. Bishop spelt it out on the tickets. These were the most successful of the “experiments,” and a very poor business it seems to have been. The private séance was followed by a more public one given last Wednesday, and, not wishing to do a possible injustice to one who has the cause of “the study of psychology” so much at heart, we made a point of being present.

A large and distinguished audience had been invited; and Mr. Bishop, by way of prelude, skilfully referred to a journey which he had undertaken to India “for the purpose of investigating the practices of the Indian necromancers,” and then read out a testimonial from Dr. Carpenter, couched in the terms we have already quoted; after which he proceeded to business. A “committee” of twelve men of note was chosen, and sat in a crescent of chairs upon the raised platform, suggesting an entertainment of quite another character at St. James’s Hall. The first experiment was that of hiding an object which Mr. Bishop was to find; but, although he indulged in the most frantic “hypnotic” gymnastics, and his assistant kept thinking as hard as he could upon the place of hiding, the thing was a dead failure. The next attempt was rather more successful, a concealed pencil-case being brought to light, to the great joy of all concerned, though not without much fuss and rushing about. A mysterious arrangement of passing a small doll from hand to hand and hiding it, to be subsequently hunted for by Mr. Bishop, whiled away another tedious half-hour, and ended also in failure. Some numbers written on a black-board were, however, guessed blindfold, and slightly raised the obviously flagging interest of the audience; but this seemed a more ingenious, and less ingenuous, device. The pain, also—this time an imaginary one—as in Professor Lankester’s case, was placed to the general satisfaction. The great “experiment” of the evening, however, that with the alphabet, was also a fiasco, although Mr. Labouchère, who thought of a word, was very long-suffering. This trick, in which the letters are printed on cards, connected by a string, and laid upon the platform, where the blindfolded performer hovers over them and pounces from time to time on one or another, bears so ludicrous a resemblance to that of the “learned pig” at a fair that we would suggest some variation at least of the *mise en scène*. Having twice guessed the wrong word, Mr. Bishop gave it up, and the “experiments” shortly came to an end. The whole affair appeared to us excessively dull; and, though there was nothing that indicated, or indeed required, collusion, there was certainly nothing which could further the cause of science. Nor need sensitive

people be alarmed lest their thoughts should be inopportunately revealed; for it would seem that, if they have any objection to their being read by another person they need only neglect to concentrate their mind upon one thought at a time, and decline to be dragged wildly up and down the room. As a means of communication, we prefer the ordinary methods of expressing thought by speech, writing, or signs.

The practice of thought-reading in one phase or another is part and parcel of the conjuror’s art, and is no more “an interesting contribution to psychology” than is a successful performance of the three-card trick. Mr. Bishop’s performances differ only in degree from the directions given in every “Boy’s Own Book” for telling the card thought of; while they fall immeasurably short of that feat when performed by such men as the late Robert Houdin, to say nothing of that eminent conjuror’s mysterious, but anything but supernatural, second-sight. Yet we have never heard of a number of persons engaged in “almost every branch of scientific research—gentlemen whose names were more than a sufficient guarantee that the tests would be severe and searching in their character and conditions,” being asked to witness Professor Bosco-Frikell von Döbler’s remarkable experiments with a pack of common playing-cards, or his curious illusion with three domestic thimbles and a pen. We shall expect to see next announced a similar gathering of scientific men to investigate the curious problems in the equilibrium of the human body, illustrated by a Japanese acrobat upon a pole.

We are grieved to be obliged to speak in so disparaging a manner of a young gentleman who has no object in view but to make “an interesting contribution to the study of psychology,” but we would remind both him and his scientific admirers that the “thought-reading” form of inspiration is “rather played out” by this time. Continental newspapers are crammed with advertisements of *soi-disant* “somnambulists,” who profess to do the same sort of thing in a more thorough style; but abroad it is the police, and not the scientists, who keep an eye upon the affair. The discoveries of the early “phrenologists and physiognomists” as to the conformation and functions of the brain led to many mad theories, and it was but a slight step from judging of certain indications of character by the shape of a skull to declaring what was passing in the subject’s mind at a given moment. Time and common sense, however, soon reduced these pretensions to within reasonable limits, although they made great stir at the time when they were first advanced. The practice of “thought-reading,” too, is well known in the East; and the annals of Buddhist sages who have qualified themselves as “seers” by contemplating their own waist-bands for lengthened periods, and of Sufi mystics in Persia and Turkey, who have attained the same powers by fasting and other ascetic practices, are full of authentic instances of the exercise of this faculty. The reader of such anecdotes, however, merely pities the “poor heathen” who can be so superstitious as to believe such nonsense, while the vagaries of a young man who thinks himself the prophet of a new scientific religion because he is sharp in detecting “indications unconsciously given by the subjects experimented upon” are regarded as worthy of the serious attention of eminent men. Such exhibitions are in every way unwholesome; they encourage a misguided hankering after notoriety in the performer, they suggest a fresh means of imposture to professional charlatans, and, worst of all, they bring science and scientific evidence into ridicule and disrepute.

THE PARIS SALON.

THIS year’s Salon has been looked forward to in Paris as promising to be of exceptional interest, on account of the fact that the artists have at length decided to set aside all offers of Government assistance and to conduct their own exhibition in their own way. The public have reason to be grateful to them for two important reforms—the number of pictures admitted for exhibition has been limited, and comfortable seats have been placed in every room. Of the promised improvement in the quality of the works exposed there is little to be said. After much debate, and a good deal of unseemly quarrelling, a jury was formed which has produced the same result as that which has been attained by its predecessors—an exhibition containing pictures of great merit, swamped by the intolerable deal of trash surrounding them. The most ambitious work exhibited this year is M. Paul Baudry’s “Glorification de la Loi,” to which the place of honour has been assigned. It is a truly noble example of the highest order of decorative art; and it is difficult to find any shortcoming either in its design or in its admirably harmonious colour. Before the figure of Justice seated on a throne stands the figure symbolic of executive power ready to do her behests; to the left, on a mass of drapery, lies the foreshortened figure of a child most powerfully drawn, with a seated woman by her side; above the figure of Justice an angel flies, whose drapery expresses vigorous movement in every fold. The architectural background is faultlessly rendered, and but for a certain lack of nobility in the heads of his figures and a slight tendency to heaviness in the outstretched arm of the figure of Justice, we could dismiss M. Baudry’s magnificent picture without any word of criticism. His portrait of Louis de Montebello (107) is our ideal of what a boy’s portrait should be. It is full of life, and very strong in colour, as fine in its way as his larger canvas. On M. Carolus Duran we have also little but praise to bestow. He is this year seen at his

best. His "Futur Doge" represents a little child whose head, surmounting a bib and full of the gravity of babyhood, is in exquisite contrast with the richly-embroidered costume he wears. His Portrait of a Lady (378) is also admirable. The head seems to us to be faultless, and the black dress is very powerfully dealt with. The blue curtain which forms the background is finely treated; but to the hands we must take exception—they are feeble in drawing to the last degree. M. Bonnat's portraits of Léon Cogniet and Madame la Comtesse Potocka are likely to raise much discussion. It is impossible not to render homage to M. Bonnat's extraordinary technical skill; but his painting this year is painfully hard and unsympathetic. On the other hand, it is only fair to say that his pictures are so placed that it is very difficult to see them from a favourable point of view. Among the other portraits exhibited, those which seem to us most worthy of remark are M. Gabriel Ferrier's portrait of M. Claudius Popelin (871), M. Jenoudet's portrait of M. M. D. (1217), and M. Mathey's portrait of M. Saint-Saëns (1555). There are, of course, the usual number of what in French studio slang are known as "grandes tartines" to be seen this year—immense canvases covered with huge sprawling figures, representing historical subjects. Years ago Charles Baudelaire complained bitterly of the crass ignorance of French painters in regard to the subjects they undertook to represent. The same defect is patent this year in all the purely historical works exhibited. In M. Comerre's "Samson et Dalila" the costumes might be of any period, and pillow-cases of the latest Parisian fashion are seen in great profusion on Dalila's enormous couch. In M. Brehan's picture (285), which represents the Median King Kyaxares seeing the Scythian officers whom he has invited to a banquet slaughtered before his eyes, the King and his attendants drink out of Venetian glasses. Among the numerous works exposed in which size takes the place of merit, the worst is incontestably M. Perret's "Semeur," in which the action of Jean François Millet's figure of the sower is most vulgarly travestied. M. Protais exhibits a miserably feeble composition, entitled "Le Drapeau et l'Armée"; and, besides these two canvases, there are many other bad pictures, executed on a formidable scale, of which it is not our intention to speak. M. Detaille has had a most ungrateful subject to deal with in his "Distribution des Drapeaux," which represents an incident of the great review on the 14th of July last year. Official pictures are proverbially failures, and we are sorry to say that this one is no exception to the rule.

Of military subjects there are as usual enough and to spare. M. de Neuville has one very fine picture, "Un Porteur de Dépêches" (1724), a French despatch-bearer being searched by two German soldiers while a group of officers at table outside an inn look on. His picture of the attack upon the cemetery of Saint-Privat (1723) cannot be ranked among his higher achievements. It is decidedly muddy in colour and very confused in grouping. M. Bertrand has a powerful picture of a wounded standard-bearer supported by his comrades, hung in the Salle d'honneur. We are glad to be able to note a decided diminution in the number of morbid and disgusting subjects treated in this exhibition, in comparison with those of the last few years; but M. Lauprède's picture, "La Question," calls for comment of the severest kind. We are at a loss to understand what perversion of artistic feeling can possibly prompt a man to seek for his subjects in the torture chambers of the Inquisition. This abominable picture, which is only the more offensive on account of its cleverness, is a disgrace to the artist who painted it and to the jury which suffered it to be exhibited. Very different in treatment is M. J. P. Laurens's "Interrogatoire," in which the face of the unfortunate old monk, who is about to be stretched by means of a rope running over a pulley attached to the ceiling, while his feet are secured by an iron ring to the pavement, is full of humour. The heads of his *confesseurs* in the background are also excellent in character, and the execution of the picture is good throughout. His portrait of "Mme. la Comtesse R." is, however, astonishingly poor for the work of an artist of his capacity. M. Benjamin Constant has never before been seen to such advantage as he is this year. His two pictures (516, 517), the first "Passetemps d'un Kalife" and the second "Hérodiade," are alike admirable. The first shows us the interior of a Moorish palace at Seville in the thirteenth century, where, in the midst of a gorgeously decorated courtyard, a couple of lion cubs are being presented to a sackful of snakes which has just been opened by an attendant. The quaint mixture of anger and hesitation in the figures of the lions is wonderfully indicated, and the painting of their keeper, who walks behind them, is very masterly. The treatment of the accessories is excellent throughout, and we find in them a degree of warmth and solidity of colouring to which M. Benjamin Constant had not hitherto attained. Herodias (517) crouches, her chin supported on her hand, upon the sofa, facing the spectator. Her face is of a somewhat animal type, but is full of sensual beauty; the upper part of her figure is partially naked, and is most admirable both in colour and modelling. The feet are also naked, one of the toes being encircled by a magnificent ring, and they are most striking in their execution. The prevailing colour of the picture is deep crimson, and its every tone reveals the power of a colourist of no common order. Very powerful also is M. A. Morot's "Temptation of St. Anthony," in which the flesh painting of the undraped figure of the temptress calls for especial commendation. The "St. Gerome" of M. Henner is among the most important works exhibited, but he can hardly be congratulated upon

it. The Saint lies stiffly across the picture on an inclined plane, the right leg and left arm being stretched out in such a position as to form a straight line of considerable length, while his beard stands up perpendicularly. By an unfortunate error of composition, the left leg is so placed as to make an equilateral triangle in the centre of the canvas. His picture of "La Source" shows us a naked figure of a girl sitting by a pool. In this work there is considerable charm of colour, but M. Henner's practice of painting backgrounds, intended to represent trees and grass, in pure bitumen, cannot be commended. M. Bougereau, whose painting becomes more distractingly waxy year by year, has sent two pictures, "La Vierge aux Anges" (265) and "L'Aurore" (266), which cannot fail to delight those persons who find their pleasure in the contemplation of feeble sentimentality. "Le pauvre Pêcheur" (1944), by M. Puvis de Chavannes, goes far towards compensating us for the dismal lack of imaginative power which is to be observed at the Salon. His treatment of the subject is purely symbolic, and the execution, though it betrays no lack of power, is simple to the last degree. But as his picture is conceived in a tenderly poetic spirit, it is not likely to prove attractive to the French public.

Among the purely realistic pictures exposed, the best seem to us to be M. l'Hermite's "Quatuor" (1443), a group of four peasants round the table of a cabaret, which is excellent in composition and colour, though it is somewhat flat in effect; and M. Dantan's "Déjeuner du Modèle" (590), in which we see a model at breakfast in a painter's studio. It is, however, decidedly inferior to his interior of a sculptor's studio, exhibited last year, and which is now in the Luxembourg Gallery. It is not easy to conceive the frame of mind which the members of the jury were in when they accepted M. Manet's "Portrait de M. Perteuisset, le chasseur de lions," a title which is at once suggestive of Tartarin de Tarascon. In the "Impressioniste" gallery, of which we have recently had occasion to speak, there are few worse pictures than this to be found. A violet man with a violet gun in his hand sits in the midst of a wood of the same colour, the head of an impossible yellow monster appearing on one side of him. M. Maignan's picture of Dante meeting Mathilda is an excellent work, showing real poetic feeling, although he might have made his Virgil a little less leaden in hue. Of M. Falguière's "Abattage d'un Taureau; souvenir d'Espagne," we cannot say too much good. He has treated his subject in a truly imaginative spirit. The action of the two men, one pulling down the bull's head with a rope, while the other swings a club with which he is about to strike, is truly grand. The background is formed by a steep bank of grass, surmounted by the deep blue of a cloudless sky. The colour is fine throughout, and M. Falguière's great knowledge as a sculptor has stood him in good stead in the broad powerful modelling of his figures. It is greatly to be regretted that he has not contributed any important work to the sculpture gallery this year. Mr. Hawkins's picture of "Les Orphelins" (1112), two little children standing in the long grass of a country graveyard, bids fair to be one of the successes of the year. It is a most charming picture, beautifully harmonious in colour, and tender in feeling.

M. Skredsvig shows great promise as an animal painter in his "Fermé à Venoix" (2187). Among the landscapes there is much rubbish to be met with, but some of the pictures exhibited are of rare merit. Among these we may cite M. Denduyt's "Dégel" (679) and M. Loir's "Giboulées" (1463). This picture is of rare merit in its solidity and atmosphere; and in looking at it one instinctively glances at one's feet to see if they are wet. M. Montenard's "Sur la Falaise," which hangs in the same room, is also a very powerful picture. Of the other works of merit among the landscapes our space does not permit us to speak; but we cannot pass over M. Saintin's picture (2085) in silence; it is certainly among the very best of the landscapes exhibited.

THE RISE IN FOREIGN STOCKS.

AS was to be expected, the extreme discredit into which Foreign Government securities fell in consequence of repudiations some years ago, and of the inquiries of the Foreign Loans Committee, has been followed by a general and equally extreme rise. We have had this week a very striking instance. Only four years ago the Hungarian Government was obliged to pay 6 per cent. in gold upon bonds which it sold at 83½ per cent. This week it has brought out a loan to pay off the former bonds, the interest on which is only 4 per cent., and the price asked is 75½ per cent. In other words, whereas four years ago a lender to the Hungarian Government got about 7½ per cent. for his money, he now gets very little more than 5½ per cent. Nothing in the meantime has occurred to account for this extraordinary improvement in the credit of the country, except, indeed, that the Eastern Question is not quite so threatening as it was. Hungarian finance is nearly as unsatisfactory as ever. Year after year there are deficits, and, consequently, of course, the debt grows. Not less striking is the steadiness of Russian securities in the face of the assassination of the late Czar, of the boldness and influence of the Nihilists, and of the apparently imminent danger of insurrection or revolution. The bonds of 1873, for instance, which in the middle of May, two years ago, were selling at 84½ 10s., at the end of last week were selling for 94½ 10s.—a rise of about 10 per cent. And in Austrian securities

again the rise is nearly 25 per cent. There are good reasons for the advance in United States bonds. The cessation of internal disputes; the vast growth of population and wealth; the rapid reduction of debt; and the present extraordinary prosperity—all justify and account for the great rise that has taken place. So, again, in the case of France. Although a war between France and Germany is still expected some day or other, the political condition of the country has vastly improved; the present military system is believed to be incomparably better than the old; and the increase of wealth is unquestioned and unquestionable. Likewise in the case of Italy there has been such progress as fully accounts for the improvement in her credit. The deficits with which her budgets so long closed have now disappeared, and her finances are in a satisfactory condition. In these three instances, then, there is no room for wonder at the rise that has taken place. But these are exceptions. If we turn to the Argentine Confederation, we find there a rise in the last two years of about 38 per cent. In Brazilian stock the rise is over 14 per cent., and in Chilean about 66 per cent. Nor is the rise confined to the securities of States which are solvent, and have always been careful of their credit. In Spanish the rise is about 54 per cent.; and in Mexican, which for a long series of years have never paid a single farthing of interest, there is a rise of 173 per cent.; while in Turks the value of the bonds has fully doubled. No doubt there are special reasons in each of these three cases, and in others that might be mentioned, which seem to justify in the eyes of speculators the prices they are now giving for the bonds; but the upward movement is so universal as to prove that it is independent of special causes and is, in fact, part of a general movement springing out of general causes.

The first of these general causes is the reaction referred to above from the exaggerated discredit of a few years ago. After the Foreign Loans Committee prices fell far lower than the facts justified, and an extravagant reaction was consequently inevitable. This reaction set in when speculation revived in the autumn of 1879. The long depression that had previously prevailed passed away, and people rushed to invest their money with as little reflection as they had previously used in refusing to engage in even the most promising operations. And they were aided in doing so by the willingness on the part of the banks to make advances to them on the stocks thus purchased. Had trade improved as much as was expected, and at one time last year seemed probable, the demands of merchants and manufacturers would have created a competition for money, and would have prevented this rapid rise in the prices of stocks. But the long series of bad harvests has prevented trade from improving as quickly as had been hoped, and in consequence the banks find themselves with large funds that they are unable to employ otherwise than by lending upon stocks. As it happens, too, the changed circumstances of trade increase the amounts which bankers are able to lend. In the old time trade was chiefly carried on by means of bills. The manufacturer drew bills upon the wholesale dealers, and the wholesale dealers in turn drew upon the retailers. In the same way exporting houses drew upon the houses to which they consigned their goods abroad. But of late the manufacture of bills has become very much less, partly because people engaged in trade are richer, and consequently have more capital of their own to employ, and partly because they do not now keep as large stocks as they formerly did. The railways and telegraphs have rendered it unnecessary to keep these large stocks, and, in the case of foreign trade, enable payments to be made by means of telegraphic transfers which formerly were done entirely by bills. Thus the demands upon bankers for legitimate trade are less than they used to be, just at the time that the deposit system has received its greatest development by the extension of banks all over the country. Another cause forcing up prices is the accumulation of savings. Year after year, in what are called bad times as well as in good, the thrifty lay by a portion of their incomes. A part, greater or less, of those savings is invested in business, in reclaiming and improving land, in building houses, erecting factories and workshops, and generally in extending the concerns of those who have saved. But another part is available for investment in stocks, and, when trade is slack, this part is larger than when it is very brisk. During the long depression, the investments in business proper were probably smaller than usual, and money consequently continued to accumulate in the banks in the form of deposits. When credit revived, investments once more were resumed. The owners of the surplus money had no option but to invest it in such stocks as existed, and the better class of Foreign Government securities naturally attracted a large portion of it. When the prices of first-class securities were driven up, people who were unwilling to accept of small rates of interest rushed to the less secure stocks, and in turn they took up stocks upon which no interest is paid, in the hope that something would be done to induce the bankrupt Governments to resume payment, or at the worst that they would be able to sell to other speculators coming in after themselves, and would thus realize in the shape of additions to their capital the interest which they had failed to receive. Had there been any mania, such as the company mania of some years ago, or the railway mania of an earlier date, no doubt these surplus savings would have largely been used up thereby; but in the present revival of speculation there has been no such mania, as yet at least, and consequently existing stocks have received all the benefit of the new investments.

The great reductions that have been made in the debts of so

many of the principal countries have still further aided in raising the prices of the remaining stocks. For instance, including the operations of the present year, the reduction in the debt of the United States since the close of the war has been about 180 millions sterling; and, at the same time, the interest upon that debt has been reduced from 6 per cent. to 4½, 4, and 3½ per cent. There is thus little more than half as much debt as there was fifteen years ago; and the interest received upon the money actually invested in this debt is very much less than half what it was then. Here at home, though we have not done as much as the Americans, yet we have paid off a very large amount of debt; and the appearances are that the reductions of the next few years will be still larger. Indeed, the actual amount of the English funds now in the hands of the public very little exceeds 500 millions sterling; and the great operation which Mr. Gladstone is about to introduce will at once take away another 60 millions of this sum. In France, instead of reductions, there have been additions to the debt, it is true; but these additions have not been large since the great indemnity loans were raised, and in the meantime the savings of the country have been enormous, and have been largely directed to the securities of the country itself. Italy, again, a few years ago was a constant borrower; but now she has a small surplus every year; she is about to resume specie payments; and she will probably, after this year, begin steadily to pay off a portion of her debt. In any case, instead of being a borrower, she has been gradually buying back her bonds from foreign countries, and thus the Italian securities which were available for investment in England and France at low prices are now held in Italy. In short, since the great French indemnity loans were raised there has been no considerable increase of the debts of the first-class States of the world, whereas there has been an enormous reduction both in the United States and in England. This diminution in the amount of stocks available for investment at the same time that the funds seeking investment have been enormously increasing, necessarily brings about the extraordinary rise that we have seen. A great improvement in trade creating a demand for money for trade purposes would check this rise, as it would induce people engaged in trade to sell their securities and invest the proceeds in their business; and it would also induce bankers to lend less upon stocks and more upon goods. A great European war would still more decisively check the rise. If it were to last for any length of time, it would necessitate the issue of great loans, and—for the time being, at any rate—would absorb all the spare capital of the world. It would also lead to the destruction of a considerable amount of capital. In both ways it would probably cause a considerable fall in securities. But, in the meantime, the rise in the stocks of all great Governments must go on, while trade remains as slack as it is and the peace of the world is maintained.

THE PICTURE GALLERIES.

III.

IN returning to the more detailed examination of the exhibition at Burlington House, we shall take the liberty of avoiding the crowd which blocks up the first room, and of beginning with the pictures in the last gallery. This brings us immediately to Mr. Watts's admirable study of "Mr. Cockerell" (1391), a harmonious but somewhat unfinished work which contrasts with its neighbour, "Mr. David Dale" (1392), a full-length figure, one of Mr. Onless's most sober and most complete compositions. The head of this portrait could hardly be carried further, or treated with more intelligence. Mr. Horsley's "An Alexandrian School" (1399) and Mr. Arthur Stocks's "On the Sick List" (1400) are examples of two rising figure-painters who show to more advantage in works to which we shall refer later on. Mr. Robert W. Macbeth has given too little time to the completion of his large and luminous picture "The Ferry" (1407), which indeed displays in parts, as particularly in the group beyond the river, and in some of the heads in the boat, all his remarkable originality and power, but which shows no less a carelessness and crudity in the treatment of what is not directly sympathetic to him. Sir Frederick Leighton's "Viola" (1414), a dark-haired girl's head in profile on a gold ground, is certainly among his most exquisite contributions, and is a work on which the eye rests with entire satisfaction. By an instinct extremely little developed in this year's Hanging Committee, Mr. Davis's harmonious and serene night-landscape, called the "Evening Star" (1416), hangs between this delicately finished head and its companion "Bianca" (1417). Deservedly on the line in a place of honour we find Mr. Wigram's very remarkable portrait of "Colonel Henry Yule," a half-length figure seated at a table, busily writing. The force and intelligence of the head and the powerful rendering of the velvet coat make this not only the best of Mr. Wigram's portraits which we remember to have seen, but one of the remarkable portraits of the year.

It is difficult to deal with a crowded figure-piece like Mr. Topham's "Renouncing the Vanities by Order of Savonarola" (1423). It is a picture full of vigour, carefully considered, painfully composed, but belonging too much to the studio. These figures are the portraits of posed models; there is no real interpretation of history, no appeal to the fancy or to the historic memory. Nevertheless, it must be admitted that there is merit in the ordering of the procession and the clustering of spirited figures around the bonfire. Mr. Edward Hughes presents us

with a noticeable "Portrait of a Lady" (1351). As far as we can see by craning our heads up towards the ceiling, Mr. Harper's "Dead Sea from Engedi" (1360) is a very accomplished and poetical landscape, sacrificed by the vagaries of the Hanging Committee. Mr. Peter Graham has done better things than his "Sunny Day" (1361), in which all nature seems to swim in an atmosphere of melted butter. One of the most notable figure-pieces in Gallery X. is Mr. Blair Leighton's "Un Gage d'Amour" (1365), in which a medieval maiden, seated in her bower, fastens a red scarf round the casque of a melancholy and amorous young warrior who waits for it outside. This picture is clearly painted, and with considerable success; but it is hardly so interesting as its pendant, the "Sir Galahad" of Mr. Herbert Schmalz (1371). The purest of knights stands underneath an ancient yew-tree, hastening to be gone; while "the wan sweet maiden" of the Laureate's poem, drowned in waves of her own silken hair, clasps around his waist a belt that she has woven for him. This picture is in some respects quaint and hard; but it seems to us to present a more poetical aspect of mediæval legend than Mr. Blair Leighton's somewhat conventional design. Between these works hangs one of Mr. Millais's superb full-length portraits, that of the "Bishop of Manchester" (1366). The visitor should spare a moment to Mr. C. K. Warren's creditable "An Egyptian Musician" (1367), which is hung rather high, and might escape his notice. Mr. Calthorpe paints some monks in white robes, walking, reading, or feeding their doves, in a very dreamy and sequestered succession of "Cloisters" (1376); this is a very pleasing example of this artist's work. Mr. J. D. Watson expends humour and vigorous brush-power on his "Unpromising Pupil" (1383), and Mr. Oules is as admirable as usual in his "Portrait of a Gentleman" (1384). We believe that we have now exhausted all that is of special interest in Gallery X.

We pass rapidly through the galleries dedicated to architecture, engraving, and water-colour painting, and find ourselves in the lecture-room. With Mr. Thornycroft's "Teucer," which holds the place of honour here, we shall deal when we arrive at the rest of the sculpture; for the present we confine ourselves to the oil-paintings on the walls. At the very outset we meet with an instance of scandalous mismanagement on the part of the Hanging Committee—which, indeed, has played at topsy-turvy throughout this gallery with extraordinary success. On our left hand, as we enter, there hangs on the line a daub called "In Sight" (877), which unites almost all the qualities which a picture should not possess; and in the same perpendicular, but at the extreme height possible, is skied one of M. Fantin's delicate studies of flowers. In a better position we find Mr. Woodville's "Candahar" (887), a spirited battle-piece, representing the storm of Gundi Mullah Sahibdad by the 92nd Highlanders and the 2nd Goorkhas. This is the best large work hitherto exhibited by a rising draughtsman, who won his spurs by his spirited sketches of scenes in European Turkey. The composition of this picture is exceedingly effective; all that it seems to want is a more solid "palette," a more learned and decisive treatment of colour. It is unfortunate for Mrs. Butler that this very careful battle-piece hangs so near her confused and ill-painted "Defence of Rorke's Drift" (899), by far the least satisfactory work she has exhibited since her first success. This picture has a dull look, as though it had been "pulled about," to speak technically, until all its freshness and vitality had gone out of it. But there are glaring errors in perspective and false quantities in drawing that cannot be so excused; and, on the whole, it is to be feared that extravagant popularity has had an evil influence on an artist who once promised very sound and excellent work. Mr. Napier Hemy, too, is not himself this year, in his one picture "The Lobster Boat" (893), in which the sea is faulty. Miss Hilda Montalbo's "Venetian Fisher Boy" (897) seems to possess all the merit of draughtsmanship and colour which her similar picture last year displayed; but whereas that was hung on the line in the first room, this is skied so close under the ceiling that it is almost impossible to see it. Mr. Bright Morris is a very careful and refined landscape-painter in the school of Frederick Walker. Perhaps in his study of cabbages in an "Old Scotch Garden" (900) he follows the actual practice of his master too closely; but he has certainly painted one of the most harmonious and delicate of the small landscapes of the year. Mr. Legros's "St. Jerome" (903), a large figure which hangs beside Mr. Morris's landscape, is Academic in character, and leaves the spectator indifferent. Mr. Bridgman has been inspired by Mr. Long's successes in painting his "Funeral Rites of a Mummy on the Nile" (906), and has produced a pleasing work full of antiquarian ingenuity. But the spectator may feel that this is not the way in which Mr. Alma Tadema would have treated so congenial a theme. Mr. Val Davis, not to be confounded with the eminent cattle-painter, has achieved a success with his "Evening in the Meadows" (908); Mr. T. M. Rooke, the painter of "The Vineyard of Naboth" in 1876, is hardly recognizable in the conventionality of "The Lych-gate"; but he has had the misfortune to come under the patronage of Mr. Ruskin—an influence hitherto far from advantageous to any young artist. Mr. Carl Gussone paints a delightful little study in buff and cardinal red, and calls it "The Little Serving-Maid" (916). Mr. Wilfrid Herbert's portrait of his father, the Academician (920), is a very sound and admirable work, and one, as it seems to us, of great promise. High up under the ceiling we find, by searching, Mr. John Collier's full-length portrait of Mr. Booth as Richelieu pronouncing the curse of Rome (923). The treatment of red and white robes, and

the general dignity of attitude in this picture, are worthy of all praise; but we are not sure whether we altogether agree to the interpretation of the features of the great tragedian. But it really is so difficult to see them, that we reserve our judgment on this point. One of the many excellent portraits of this year is that of "Mr. Horace Cox" (957), by Mr. Grenville Manton. Mr. Maw Egley's anecdote from *Clarissa Harlowe* (959) is painted with some skill. We are introduced to the most tear-compelling of all heroines of romance in the depths of her despair, seated in extreme dejection on her broken and tattered bed, "her dress white damask, her tangled hair shading one side of her neck." A Tunisian study of flamingoes, doves, and gazelles, called "The Pets of an Eastern Palace" (961), by Mr. H. H. Johnston, is brightly touched. But a much superior painting, technically, is Mr. Theodore Ralli's "Marianettes in the Harem" (967), which depicts the evolutions of two ingenious dolls, one of which very characteristically beheads the other, before two indolent odalisques, who can scarcely summon up energy enough to lift their heads to watch the pastime. Mr. Henry Moore's "Mid-Channel" (968) and Mr. Keeley Halswelle's "Fenland" (974) form pendants on each side of Mr. Millais's incomparably skillful portrait of Lord Wimborne (972). But the two landscapes are not of equal value. Mr. Henry Moore's vast expanse of sea is harsh and glaring in colour; this painter seems never safe unless he keeps to the silvery tones of mist and sunless sky. Mr. Halswelle, on the contrary, has achieved a success which is almost unalloyed; the painting of the sedge and of the glittering perspective broken by endless water-lily leaves. Mr. Tissot's "Good-bye on the Mersey" (981) seems to us very bad indeed, and might well pass as the work of one of his inferior imitators. In "Waiting for a Lull" (983) Mr. Edwin Hayes selects an agreeable scene from the fisher-life of Scheveningen. The visitor should glance in passing at Mr. Charles's clever "Village Ooquettes" (990), and at Mr. Brodie's "Cry for Help" (989), which is not at all clever, but of some interest as an incident of river-life. Another excellent portrait, hung almost out of sight, is Mr. Wigram's "W. Hollins, Esq." (992). Mr. Edward Fahey calls his pleasant group in a kitchen-garden "Poetry and Prose" (994). Prose gathers apples into her apron between the rows of cabbages, and Poetry stalks by her up the path, carrying "a book of verse beneath the shade." It is difficult to be altogether pleased with the "Sailing Signal-Gun" (1005) of Mr. Arthur Hughes, who, in throwing off the stiffness of his early pre-Raffaellite manner, has lost something also of his freshness and poetic individuality. The picture is too smooth and clean to look like a transcript from life; yet there is good draughtsmanship, and a great deal of grace about the figures of the courtly young officer and his handsome sweetheart.

We take this opportunity of noticing Mr. Henry Blackburn's useful *Academy Notes* and *Grosvenor Notes*, which seem even more complete and serviceable than ever. We note that the first of these has reached its seventh and the second its fourth year of issue.

THE THEATRES.—HERR STRAKOSCH'S RECITALS.

AS far as a piece obviously intended to consist of a series of scenes meant to give a popular actress a good opportunity to display her peculiar merits can be said to have a plot, this is the plot of Mr. Wills's new play. Juana Esteban, a Spanish lady, who "about 1496" lives, with a degree of independence not commonly allowed to ladies in that country, in a castle near Toledo, has taken under her care a wounded knight, Don Carlos de Narciso. While nursing him to recovery, she has very naturally fallen in love with him. Don Carlos, as he is bound to do in common gratitude, has also fallen in love with her, and proposes marriage. Juana, in spite of her passion, is in some doubt whether she shall accept. Her doubt is not caused by any distrust of Don Carlos, but because she fears that she may fall a victim to an hereditary family madness. We learn from a conversation between Friar John, the new confessor, and his predecessor, Friar Philip, that Juana's mother has died mad after giving birth to the heroine. She constantly saw before her a spot of blood, which reappears with due dramatic fatality in the course of the play, and acts as a portent, a warning of disaster, to mother and daughter. To the former it has been a sign that her husband, who is away with the King at Granada, has been murdered. Juana to quiet her doubts appeals to the new confessor, Friar John de Toledo. Now the Friar, who had been her tutor, has loved her in secret and become a monk from despair. He has been sent as confessor by his Prior, which, to come back to matter of fact details, is at least curious. Young monks—Friar John must be somewhere about five-and-twenty—were not commonly chosen as the spiritual guides of unmarried ladies living without a guardian, particularly when they were in love with the lady, of which state of feeling the Prior must have been perfectly aware from the new brother's general confession. But, putting such considerations aside, the dramatic situation is good, and Mr. Wills has used it with skill. The confessor advises his penitent to marry her lover and be happy in spite of the past, and of the warning she has already had that madness hangs over her.

Unfortunately a marriage with Don Carlos is not the way to help Juana to escape her fate. He is an impudent and heartless Don Juan. In the house of the lady he is about to marry he meets an old love, one Clara Perez, who occupies a position in Juana's

castle which it is not easy to understand. In the first act, while his new passion is fresh, he renews his flirtation with her, and is found by Juana kissing her hand. He escapes the consequences by a rather obvious lie, and his marriage follows the fall of the curtain. With these *dramatis personæ* and this position the rest of the story almost tells itself. Don Carlos is very soon unfaithful to his wife, and intrigues so openly with Clara Perez that "all Toledo" soon knows it. Juana is jealous, and before long mad. This growing madness is really the dramatic motive of the whole piece. Throughout the second act people come in and go out in an otherwise aimless way simply to show its various phases. Poor Juana tries to affect ignorance of the real state of things. She attempts to be friendly with Clara, who apparently still lives in the house; she tries to persuade her husband not to leave her for that day, as he is proposing to do, for the obvious purpose of meeting Clara. When her aunt, the Dame Garcia, accuses Don Carlos, Juana defends him; but she knows that he is false, and frantically tries to win him back. Don Carlos and Clara behave in a manner which is an outrage to all decency and probability. The woman defies her openly, and taunts her with the loss of her husband's love. Doña Juana drives her from the house. Then Don Carlos comes and treats her with brutal rudeness. He is treading on dangerous ground, for the spot of blood has been before Juana's eyes all day; and at last, when prayers have proved useless, she stabs him. With this her reason gives way altogether, and without understanding that Friar John has taken the crime upon himself, she rushes off the scene with a maniac laugh. In the two following acts, which might, with advantage, be reduced to one, there are two good and effective scenes. The first is by the bier of Don Carlos, when Friar John wounds himself in order that the ordeal by touch may seem to fix the guilt upon him. The second, when the supposed guilty monk is about to be walled up alive, and is saved by Juana, who has snuggled herself in an improbable way into the crypt, and confesses just before dying in a most sudden and unexpected way.

It will be seen that, if *Juana* is defective as a play, it is not for want of the elements out of which a most dramatic piece could be made. But the piece has been to some extent sacrificed to the actress, and it has faults of quite another kind. Characters and scenes are introduced for the convenience of Mme. Modjeska—not of Doña Juana Estoban. There is a great deal of tedious "comic business," of which, as it has no necessary connexion with the plot, we have taken no notice, and shall take none, except to express regret that the acting of Mr. Anson, which was really clever, though somewhat exaggerated, should be so utterly thrown away. In the second act the movements of Don Carlos and Clara Perez are clumsily managed; Don Carlos is for ever starting off to hunt, and never going. As a dramatic influence, too, the madness of Doña Juana is destructive of the probability of the last two acts. It accounts very well for her killing her husband, but makes the self-sacrifice of Friar John unnecessary. Doña Juana would have been in no danger. We have already said that her entry into the crypt is not sufficiently accounted for, neither is her death. It is hard to judge of the literary merits of a piece from only hearing it played; but, as far as that experience entitles us to judge, we cannot give Mr. Wills's play any high praise. The comedy, of which there is very much too much, is stilted, forced, and tedious. Throughout there are too many archaic phrases, and the imitation of the Elizabethan drama rather suggests Sheridan Knowles than Ford or Massinger. As Mr. Wills has laid his scene in Spain, we must suppose he had some reason for doing so, but it is nowhere apparent. There is nothing essentially Spanish in the story, and any one who knows that country can see that Mr. Wills has fallen into a round score of absurdities.

The acting of the company was throughout good. Even Mr. Norman Forbes and Miss Grahame contrived to be supportable, or even amusing, in spite of their parts. Mr. Barrett played the part of Friar John with force, and Mr. Forbes Robertson made a picturesque Don Carlos. He was not, perhaps, quite brute enough for his part, and in the last scene he scarcely looked as if he meant all he was saying. But, of course, the most interesting figure on the stage was Mme. Modjeska herself. In a piece written professedly to display her acting she necessarily appears sometimes at her best. In *Juana* her finest piece of acting was in the second act, where she gave the gradual growth of jealousy into madness in a way which showed natural power, aided by careful study. Her passage from surprise to doubt, and then to uncontrollable terror, when she becomes conscious of the haunting blood-spot was the best moment of the performance. Later on the acting, like the piece, becomes a trifle monotonous, with one moment of some power, when she throws herself on the dead body of her husband. In the fourth act the actress was perhaps hampered by the want of dramatic force in the words of her part, but she certainly seemed beneath the situation. The foreign accent was scarcely heard from first to last.

Some of Mr. McCullough's critics at Drury Lane have decided that his Othello is only one Othello the more. It is not the Moor, it is true; but it is as good as anybody else's. In view of this, we can only suppose that it is now generally accepted as a canon of theatrical criticism that power of expressing passion is a matter of no importance in acting tragedy. In our opinion, Mr. McCullough has absolutely no power to do so. His appearance in *Othello* is that of a handsome Lascar, with a pair of too-prominent earrings, and a wig which is on the border line between wool and hair, dressed in a bad Eastern imitation of the classic dress of Athens. His expression varies from a good-

humoured smile to an air of peevish impatience. When Iago leaves him in the third act, he sits tapping the ground with his foot, and playing the devil's tattoo on a table with his fingers. His speech before the Senate is jocular, and he ends it by exulting like a schoolboy over Brabantio. His entry in the second act is signalized by a remarkable piece of byplay. He throws a scimitar across the stage at Cassio, apparently with the intention of hitting him. His air in delivering the words "If it were now to die, 'Twere now to be most happy," was that of a man who is propounding a puzzle. There were, it is true, signs of tenderness in his earlier scenes with Desdemona, and his appearance is handsome and, at times, almost dignified; but what was absolutely wanting in his acting was tragedy. Of the other actors it is needless to speak; of Mr. Herman Vezin, because his Iago has taken its place as a thoroughly sound and scholarly impersonation; of the other actors because their acting was not of a kind to require detailed criticism. The one exception is Mr. Harris's Rodrigo, which was a masterpiece of bad taste.

Herr Strakosch's recitals at Steinway Hall, as we gather from the advertisements of the Committee, were primarily intended for the German colony in London, and to judge from the reception given them by the numerous Germans in the Hall, they were enthusiastically approved. And the approval was well deserved. Herr Strakosch has a naturally noble voice, which has been admirably trained. There was never any sign of fatigue or of failure to produce the tone intended to be given. The reciter's voice answered the calls made on it with unfading regularity. The faults observable were in taste and intention, not in execution. In the two recitals which Herr Strakosch has already given, on Friday the 13th and on Wednesday last, he has chosen as his subjects a selection from the first three acts of *Hamlet*, the first monologue of *Faust*, and a selection from *Demetrius*. As far as we can judge, the choice of the first two was not fortunate. Herr Strakosch's naturally powerful voice expresses wrath and denunciation with striking force, but seems deficient in the more delicate tones. In pathetic passages he is lachrymose, and where he should be ironical he is only jovial. The laugh of Hamlet or of Faust seems to indicate mere good humour where we are predisposed to look for melancholy or sarcasm. Nor was there much sign of refined artistic intention. In the *Hamlet*, which is the weakest of his recitals, Herr Strakosch is more than once distinctly coarse. He leaves the impression on us that Hamlet is slapping Rosencrantz and Guildenstern on the back, and finding a boyish enjoyment in throwing dust in people's eyes. There is more vulgar terror than awe in his address to the Ghost, and the line "What an ass am I!—ay, sure, this is most brave," was given almost in a tone of exultation. The same fault of coarseness is equally apparent in his *Faust*. There is none of the melancholy of the philosopher, and there is the same lachrymose intonation too frequently heard in *Hamlet*. He thundered out the lines "Ihr schwebt, ihr Geister, neben mir," &c., as if he was quelling a riot. "Welch Schauspiel! aber ach! ein Schauspiel nur," was uttered in a tone that sounded spiteful. He reached his lowest point at the words "Die Botschaft hör' ich wohl, allein mir fehlt der Glaube," which he gave as if Faust was making a triumphant point. The bad taste of the elocution was heightened by an undignified wagging of the finger. Herr Strakosch's want of refinement, though occasionally visible, was less in his way in the selection from *Demetrius*. Schiller's work deals with simpler passions and characters, and here the reciter was master of his subject. His perfect mechanical command of his voice showed to the best advantage. In the scene in the Polish Diet he rendered the efforts of Leo Sapieha to compel a hearing in the midst of clamour, and gave the noise of an angry shouting crowd in a manner which fully deserved the warm applause it gained.

REVIEWS.

THE REVISED VERSION OF THE NEW TESTAMENT.*

IT is too late to discuss the expediency of tampering with the venerable Authorized Version of the Scriptures. Much has been said, and much might still be said, on both sides of the question. But the revision is now a *fait accompli*. The New Testament, as corrected by the revisers of 1881, has made its appearance this week, not without a sufficient flourish of trumpets to herald its approach. Copies were formally laid before the two Houses of the Convocation of Canterbury, by whose authority the revision has been carried out, and also presented to the Queen, on Tuesday last, and the work is now *publici juris*. It remains only to examine how the task has been fulfilled, and to speculate on the probabilities of this new version being able to supersede the old version for private reading or in liturgical use.

The zeal and critical skill of the "Company" of the New Testament Revisers deserve, in the first place, the most frank and hearty commendation. We may fully trust the scholarship and the good faith of the eminent men who have been associated for eleven long years in this important work. Of the 407 meetings held by the

* *The New Testament of Our Lord and Saviour Jesus Christ, Translated out of the Greek; being the Version set forth A.D. 1611, compared with Ancient Authorities, and Revised A.D. 1881.* Printed for the Universities of Oxford and Cambridge. Cambridge: 1881.

revisers, it is said that the Chairman, the Bishop of Gloucester and Bristol, was present at no less than 405. And many other members attended with almost equal regularity. Of course a great deal of the value of this work depends on the fact that it is the product not of a varying minority, but of a permanent majority, of the revisers. Doubtless the fascination of the task, as well as a profound conviction of the importance of the undertaking, ensured the regular attendance, at much personal self-sacrifice, of the bulk of the members.

Who, it may be asked, could be insensible of the importance of an attempt to revise the English Version of the Sacred Scriptures? That version is the most precious treasure of the English-speaking peoples. Not to speak now, in this place, of the purely theological value of our Authorized Version, accepted—with all its faults and shortcomings—by all religionists among us, with the single exception of those who are obliged to adopt in its place the bald and jejune Douay Translation of the Vulgate, could it be forgotten that its stately diction, its wonderful rhythmic melody, its inimitable simplicity and pathos, are as dear as they are familiar to every educated, or even uneducated, Englishman? For the supreme advantage of an "open Bible" in the vulgar tongue is that from childhood to old age the poor as well as the rich find its utterances to be "household words." No one can imagine how much our language owes to the Authorized Version who has not taken some pains to inquire how many words and phrases and idioms and forms of speech in daily use are derived directly from the Bible of 1611. We owe further to this invaluable possession the fact that modern English is so little altered from that of the purest age of the language. Englishmen can still read without difficulty Shakspeare and Spenser, and such deterioration of speech as is inevitable in the course of years is indefinitely postponed and retarded among us by our universal familiarity with the Authorized Text. It is not a little significant to see in the appendix to the volume before us that the American Committees, who worked in harmony with the English revisers, contended—unsuccessfully, we are glad to say—for the rejection of what they call the archaic use of certain pronouns, and even for the universal substitution of the word "spirit" for "ghost."

The introduction prefixed to this volume ought to be carefully considered by every one who would understand the extreme, if not the insuperable, difficulty of the task undertaken by the revisers. Upon the whole, we commend heartily the sound judgment of the rules of action which they laid down for themselves. But we shall have to complain further on that they have, in many cases, needlessly, in our opinion, violated their own principles. The first question to be settled was, of necessity, the Greek text to be adopted. The revisers, with some ingenuity, evaded the difficulty by confining their attention to those passages only in which the variety of readings affects the English translation. Scholars would have had great trouble in testing this part of their work if the two Universities had not, with great liberality, published simultaneously editions of the full Greek text embodying all the readings adopted by the revisers. The method followed in the Cambridge book, edited by Dr. Scrivener, seems to us to show these variations more distinctly than that adopted by Archdeacon Palmer in the Oxford book, and the type of the former is larger. But the Clarendon Press volume is beautifully printed. Though this again is eclipsed by the exquisite edition of Dr. Westcott's and Dr. Hort's Greek text, issued by the Pitt Press on the same 17th of May, a day to be much remembered by Biblical critics. This last work, formed exclusively on documentary evidence without reference to any printed text, has been long expected by scholars. It is probably the most important contribution to Biblical learning in our generation. The revisers, it is understood, had the advantage of consulting it during the progress of their work.

The general principle pursued by the revisers has been, we are told, "to introduce as few alterations as possible consistently with faithfulness." But, unfortunately, opinions will differ widely as to what this "faithfulness" requires. No doubt, if the text itself is altered, a corresponding change must follow in the translation. And obvious errors must be corrected; such, for example, as (in St. Luke xxiii. 15) "Nothing worthy of death has been done *unto* Him," instead of "done *by* Him." And, if any change at all is to be made, no objection can possibly be raised against altering the ambiguous "I know nothing *by* myself," of 1 Cor. iv. 4, into "against myself." So, again, "baptizing *into* the Name" is manifestly better than "in the Name." And the "one flock, one shepherd," in St. John x. 16, is not only more accurate than the "one fold, one shepherd," to which we have been accustomed, but the change has a polemical value. On the other hand, many alterations are distinctly for the worse. Why, for example, is "love" a better word than "charity," in St. Paul's magnificent description of that Christian grace in 1 Cor. xiii. ? If the translators, or rather revisers, of 1611 erred in their avowed principle of admitting as many synonyms as possible in order to widen and enrich the language, certainly the revisers of 1881 err still more perniciously in restricting that copiousness of speech which is a distinctive glory of our language, and especially of our theological vocabulary.

In justice to the revisers, we must admit the cogency of their defence of certain changes as made "by consequence"—that is, by reason of some foregoing alteration. And we were quite disposed to think that our improved knowledge of the Greek tenses and *u.* the definite article would make many minor changes acceptable and useful. On the whole, however, when we see the numerous alterations that have crept in, which are wholly insignificant, we are very much disposed to regret that things have

not been left as they were. We do not deny that some variations of tenses in the Epistle to the Romans, in particular, have a definite theological value in bringing out more clearly the Apostle's teaching as to the change effected by the baptismal sacrament in the relation of the soul to God; and the fact that the Nonconformist members of the Company did not oppose these changes speaks highly for their candour, and may disarm some of the not unnatural prejudices which many Churchmen entertained against the mixed composition of the revising body. "Such as should be saved," in Acts ii. 47, loses its Calvinistic *nuance* in the "those that were being saved" of the Revision. But the latter phrase is almost meaningless as it stands in English; and we should have preferred a periphrasis, such as "those who were thereby placed in a state of salvation." It is a great mistake to suppose that a strictly literal translation always conveys the full sense of the original in another language. In like manner the order of words may be altered in translation without in the slightest degree affecting the truthfulness of the rendering. This seems to have escaped our revisers. They do not scruple, for instance, to change the "Lord, is it I?" of St. Matt. xxvi. 22 into "Is it I, Lord?" because the latter is the verbal order of the Greek. In fact, the minor changes of this kind are in the highest degree irritating to the reader. We are told in the preface that multitudes of changes which had been made in the first revision were altered back again in the second review. What must have been the state of the text before this respiscence! As it is, the Bishop of Gloucester and Bristol admits, in his speech in Convocation, that there are, in the Gospels, "eight or nine changes in every five verses," and, in the Epistles, three changes in every verse.

Proper names, we observe, are invariably given in the Hebrew form. Is this advisable? Would it not be better to retain the historical evidence that the New Testament has a Greek origin? Something may be said for altering "Jesus" into "Joshua" in Acts vii. 45; but "Simon, son of John," in St. John xxi. is singularly distasteful, and destroys somewhat the beautiful cadence of one of the most pathetic passages in the Gospels. Besides which it is inconsistent with the "Simon Bar-Jonah" of St. Matthew xvi. 17, which is retained by the revisers. "Elias" in like manner gives way to "Elijah," even in the Word from the Cross (St. Matt. xxvii. 46). Against this we must strongly protest.

But those who have ventured to alter the words of the Lord's Prayer—words which have been consecrated by the use of so many generations of Englishmen—cannot be expected to have shrunk from any other less audacious changes. Can it be pretended that "as in heaven, so in earth" differs in any respect in sense from "in earth as it is in heaven"? And nothing is gained in our judgment by substituting "as we have forgiven" for "as we forgive them that trespass against us." So, again, why is "bring" better than "lead" in the next clause? And we deliberately prefer the more comprehensive "from evil" to the equally, but not more, correct "from the evil one." These changes seem to us the mere conceits of childish pedantry. Happily there is no chance whatever of their being adopted. The unreformed Latin Church retains to this day in its *Breviary* the *Vetus Italica* version of the Psalter instead of the Vulgate of St. Jerome. And our own Prayer-Book Version of the Psalms has never been displaced by the more accurate, but more frigid, translation of 1611. We fully believe that our grandchildren's grandchildren will say their Lord's Prayer as we do, in spite of the improved revision of 1881.

We may add that, while the famous passage about the three witnesses in 1 St. John v. disappears bodily from the text, the account of the woman taken in adultery in St. John viii. is retained, though bracketed as doubtful, and the end of St. Mark's Gospel is preserved, with a caution in the margin. The intercalated epithet "wise" goes out from 1 Tim. i. 17. But in such critical points the revisers are not likely to be caught tripping.

It is too early to speak with more precision than we have done as to the general merits of the revision. There can be little doubt, however, that, while in many respects this translation is a great improvement in the details of accurate scholarship upon the Authorized Version, it is sadly inferior to it in general vigour and beauty of language. We are not of those who think that a very exact rendering of the original Greek is of high importance to ordinary readers so long as the general sense is accurately conveyed. There have been many recent attempts, as in the "Variorum Bible" of the Queen's Printers, and in the "Englishman's Bible" of Mr. Newberry, to make a royal road for uneducated persons into the inmost niceties of Hebrew and Greek. All such endeavours must fail. We do not, of course, compare this Revised Version with the latter monument of misplaced ingenuity. This version will be read by many with curiosity and by some with profit. But it will scarcely win its way, we think, into general authorized use. It is not safe to prophesy; but, for our own part, we venture to think that the existing Bible will hold its own. We should not be sorry to see some dozen corrections of undoubted errors admitted into the Authorized Version, and a very considerable addition made to its alternative marginal readings. But we desire and hope that the text of 1611 as it stands will be handed down untouched as a whole to our remote descendants.

CLARK'S CAMBRIDGE.*

MR. J. W. CLARK is eminently competent to speak about the University of Cambridge in all its aspects—archæological, historical, academic, architectural, and pictorial—alike from his intimate official connexion with the University and because he is in charge, for publication, of his uncle Professor Willis's exhaustive collections on the history of the colleges. As that treatise will, without doubt, be an antiquarian work of the most solid value, so the present volume has been written in order to interest readers who want to carry away some idea of Cambridge in its various aspects without the toil of too much scientific research.

The writer loses no time in claiming a personal acquaintance with his reader, while he is fortunate enough to find a "specular mount" in the well-known Castle Hill across the Cam, near Magdalene College. This mound, once connected with the Roman station of *Camboritum*, and afterwards incorporated with the Conqueror's Castle, which rose around it, was in itself probably a legacy from British times. Planted on its summit, Mr. Clark invites the reader to realize the town of Cambridge such as it existed at the end of the thirteenth century—that is, not long after Hugh of Balsham had founded Peterhouse, but yet before the town had been moulded into a cluster of colleges:—

By the end of the thirteenth century the town of Cambridge had outgrown the narrow limits that were sufficient for it when the Castle was built, and had extended itself over the level ground on the opposite side of the river, to the right and left of the Roman road, the course of which is marked by the long, straight street that runs through Cambridge from north to south, and is called Bridge Street, Sidney Street, and St. Andrew's Street, in different parts of its course. Nearest to the Castle, on the right of the street, stood the Hospital of St. John, founded in all probability by John Frost, a burgher of Cambridge.

[The river was spanned by the] Bridge, a wooden structure of many arches. The west side was bounded by the river; the east by the King's Ditch, constructed by Henry III. for the defence of the town. It left the river just above Queen's College, and returned to it below the Great Bridge. The Roman Way ran close to the eastern limit of the town, at no great distance from the Ditch. About two hundred yards from the Bridge a second street branched off to the right, dividing the town into two nearly equal divisions. This, the present Trumpington Street, was then called High Street, or High Ward. At the point where it branched off, on the left of Bridge Street, stood one of the four circular churches in England, probably even then of considerable antiquity, called St. Sepulchre's. Round it clustered the Jewry, a quarter of considerable extent, for it stretched along the eastern side of High Street, far enough to include All Saints' Church. Opposite to this Church stood the Hospital of St. John, with extensive gardens and fishponds behind it. Beyond the Hospital, to the south, there was a dense network of narrow lanes, with here and there a garden, or a vineyard, or a wharf along the river bank, separating the compact masses of dwelling-houses which extended as far as the Carmelite Friary at the south-west angle of the town. Close to this the High Street crossed the King's Ditch by a bridge, to the north of which was Trumpington Gate, perhaps a fortified structure, as the other gates of the town may also have been. Outside the gate, at the commencement of a straggling suburb, stood the Church of St. Peter, in the midst of an extensive graveyard. Beyond it was the House of the Brethren of the Penance, or Penitence, of Jesus Christ, otherwise called "Friars of the Sack"; opposite to which, on the other side of the street, was that of the White Canons of Sempringham. Had the eyes of our imaginary spectator followed the line of the boundary ditch, which must have been well marked by the broad band of unoccupied ground—a sort of boulevard—that extended along it, he would have seen the then newly-built House of the Augustinian Friars, with the extensive garden ground behind it, which became the Botanic Garden in the last century. Further to the east again, on the right of the Roman Way, was the House of the Dominicans, or Black Friars, after whom that portion of the street was afterwards called "Preachers' Street." At that time the House was probably unfinished; but in later days it became an extensive pile of buildings, with a lofty church, the outline of whose nave may still be traced within Emmanuel College, whose founder, Sir Walter Mildmay, in sublime contempt of the old religion, boasted that he had turned the Friars' church into a dining-hall, and their refectory into a chapel. Between this and the Round Church was the Franciscan House, which even then was probably extensive, but which afterwards possessed a spacious church, which Ascham described as an ornament to the University, and of which the foundations in Fuller's time could still be traced within the precincts of Sidney Sussex College. At the Reformation the University tried to obtain a grant of it, but without success. The solid walls were gradually destroyed to build other structures, as the items "stone from the Grey Friars," in the accounts of more than one college, conclusively show. These monastic buildings stood close to the outskirts of the little town, but still within the precincts. Beyond them were spacious commons—Cow Fen or Coo Fen, on the west; then Saint Thomas' Leas; and lastly, the Green-croft, which extended almost from the Great Bridge to the neighbouring village of Barnwell. In the midst of it, walled about, and overshadowed by trees, stood the Benedictine nunnery of St. Rhadegund, afterwards Jesus College, while Barnwell would be rendered conspicuous by the great Priory Church of St. Giles.

This is no picture of a University town as we now understand the term, but it calls up one which is full of institutions devoted to religion and learning. So, in perusing the list of old religious houses at Cambridge, we are inclined to look at the phenomenon from a point of view rather different from that which Mr. Clark takes up. His leading idea represents a rather sharp antagonism between the college and the house of friars or of some other order. We should rather dwell upon the points in which the institutions resemble each other. Accordingly, while giving all glory to Merton and Balsham for the beneficent and successful revolution which has made their names immortal, still, we must acknowledge that, after all, they varied rather than reconstructed that great idea of religion and learning, working together through corporate bodies, which was the prominent characteristic of the middle ages, and which has graven a mark which is probably indelible upon the outward

aspect of universal Christendom. We have only to recall what we are told of the cathedral schools in Carolingian days, and of the literary position of the great old Benedictine houses, to appreciate that these and the colleges were, after all, varying developments of the same idea. The common life, the common worship, the common studies, were the foundation stones of either. The colleges were more lightly equipped, more nimble, more elastic, more capable of submitting to the common general control of a pre-existing popular body which absorbed their collective members, such as that which did not scruple to assert its far-reaching superiority in the proud designation of "Universitas." But, if we could conceive Benedictines and Franciscans, Dominicans and White Canons, forgetting personal rivalries and accepting the common superintendence of a mixed body made up of all the adult members of the conventual houses, then we should have possessed an institution not very different from our own mediæval and renaissance Universities, although the contributory corporations might have been called convents, priories, cells, and so forth. In fact, in one aspect of the matter the early colleges went on rather in a course of gradual approximation to, than in a divergence from, the older religious communities. The modest house in which the knot of early students began by living hard lives under that "master" whom we should now call a private tutor, and for their worship seeking the neighbouring parish church, were far more unlike the convent next door than their successors showed themselves after the lapse of a century or so which had enriched their community with that chapel which did not fear rivalry with the conventual church of the smaller type, and with that hall which closely recalled the monastic refectory. At last a Nunnery Church like that of St. Rhadegund at Cambridge found itself with little difficulty transformed into Jesus College Chapel.

Rapidly traversing the centuries, Mr. Clark passes from the thirteenth to the nineteenth, and, as he leads his readers on a promenade through the existing Cambridge, he naturally begins alike for local and for chronological reasons with Peterhouse. It is probably to this choice of starting point that one must attribute the omission, which must be accidental, of that next neighbour of Peterhouse, the Fitzwilliam Museum. The author is not one whit too severe upon the melancholy and we apprehend far from necessary razzias which have been perpetrated at Pembroke College. In reference to this we may notice that, out of the twelve dainty etchings and nineteen equally picturesque woodcuts with which the work is illustrated, one of the only two examples of archæological interest represents a very picturesque oriel which was in existence until the Master's lodge of Pembroke fell before Mr. Waterhouse's improving touch. We are sorry at the rule which must have governed the selection of these illustrations. Perhaps the general reader may be more easily attracted by the presentment of actual Cambridge, but the more to be respected particular reader would have been more contented if Mr. Clark's archæological researches had not disdained pictorial help. But we should have put in a plea of extenuating circumstances for another architect who is no favourite with the author. Mr. Clark is very hard upon Wilkins, the architect of the new buildings of King's College, for the shortcomings of that work. No doubt his Gothic works at King's, Corpus, and Trinity do not stand the test of modern criticism; but such things should be looked at relatively not less than positively. Wilkins, sixth wrangler in 1800, and author of valuable works on the antiquities of Magna Græcia and Athens, was called upon to design in a style unfamiliar to himself and not yet made easy even by Richman's rudimentary discoveries in old English styles. At all events, he soared above the lath and plaster, the wild denial of mouldings, the grotesque unmillioned windows of Betty Langley and the Strawberry Hill school, and strove laboriously to reproduce the mullions, the window forms, the mouldings, and other component elements of that Perpendicular which was in those days held to be the perfection of Gothic. There can be no doubt that Wilkins's works at Cambridge stand in very favourable contrast to the factory which the pioneer Richman inflicted on St. John's in its new court.

The author has, on the other hand, our cordial sympathy in his lamentations over an action of the Camden Society, in one of those fits of artistic purism which sometimes diverted it from its path of practical reform. Till about forty years ago the battlements at the top of the tower of St. Mary's were crowned with balls, ugly no doubt, but proclaiming the date of that specimen of seventeenth-century post-Gothic. But to Camdenian eyes they were an abomination, and with their destruction disappeared a landmark of architectural history.

We wish that we had space to epitomize Mr. Clark's very interesting recapitulation of the nest of colleges and hostels which occupied the ground now appropriated to Trinity College. He brings out vividly how much the college owed to the architectural genius of that great master, Neville, not only for building his own Court, but for developing the Great Court out of chaos. In speaking of the Market Place, Mr. Clark refers to a curious episode of the middle ages which helps to explain that lack in the University of ancient monuments, taking advantage of which calamity the imaginative antiquaries of the sixteenth and seventeenth centuries wove so fantastic a web of fiction:—

Inconvenient as the old Market Place was, it had witnessed several curious scenes. In 1382, just a hundred years after the foundation of Peterhouse, the first great explosion of feeling against college encroachments culminated in a serious riot.

The ring-leader, one James de Grantchester—with the connivance, it is said, of the Mayor, who ought to have known better—got together an armed mob. They first sacked and burnt the houses of the University officials;

* *Cambridge: Brief Historical and Descriptive Notes.* By J. W. Clark, M.A. With Etchings and Vignettes by A. Brunet-Debaines, H. Toussaint, and G. Groux. London: Seeley, Jackson, & Halliday. 1861.

then they burst open the gates of Corpus Christi College, which they pillaged; and, lastly, proceeding to St. Mary's Church, they possessed themselves of the common chest of the University. From this repository they extracted the charters, bulls, and other muniments, which they carried off in triumph into the Market Place. There they broke the seals of the charters with clubs; after which they piled up a huge bonfire, and burnt them all, amid the rejoicings of the populace. An old woman, named Margaret Sterr, gathering up the ashes, scattered them to the winds, exclaiming, "Away with the learning of the clerks! away with it!"

The last chapter, entitled "Cambridge Sixty Years Ago," will probably be the most popularly interesting. How much the outward aspect of Cambridge has changed we can appreciate when we read that

To begin with, it must be borne in mind that the town of Cambridge was very different then from what it is now; indeed, with the exception of the destruction of the great religious houses, it had not been much altered during the four centuries since the period at which we attempted to sketch its aspect in our first chapter. The country round about it was quite unenclosed, and to the south and south-east a man on horseback might gallop for miles uninterrupted by a single fence. The ground where the now populous "New Town" stands was then a swamp, where sportsmen were sure of snipe, and the road that now leads to the railway-station was an elevated causeway, with this marshy ground to the right of it. The velvety turf of the Gogmagog Hills had not then been ploughed up, and a bayard was still occasionally to be seen there. The streets could hardly have been worse paved than they are at present, but some of them were much narrower. A row of ancient houses stood where the lawn in front of King's College now is, at a distance varying from ten to twenty feet in advance of the present iron fence. Trumpington Street, in this part of its course, was nowhere more than twenty-five feet wide, and as the upper stories of the houses projected beyond those beneath them, it used to be maintained, graphically rather than delicately, that a man could spit across it. The only light used at night in the streets was oil. Only one post came in, and one went out, in the twenty-four hours. There were no public conveyances.

But the social change was as great. Public lecturers are fond of dwelling upon the progress of the age, and these words usually run through their hearers' heads from ear to ear without leaving any definite idea behind. But that man can form some notion of the greatness of the revolution who apprehends that at a date when still living and busy lords, spiritual and temporal, and members of Parliament were smart young men, the undergraduate who stepped forward in breeches and white stockings was a law-abiding, meritorious personage, while the abandoned youth who dared to encase his legs in trousers or even gaiters was a law-breaking reprobate. Perhaps a similar astonishment may be provoked sixty years from the day of this review by the historian who shall remind his incredulous readers that in this more enlightened epoch the goal was the doom of the vicar who dared wear a red dress when the Courts told him that his duty was to put on a white one. The desponding veteran to whom the end of the world has come in dinner-time in Hall having advanced from four o'clock to seven, will be cheered when he learns that Bishop Watson gave way to like feelings himself when it was fixed at three o'clock, and he may also draw comfort from the consideration that the Vice-Chancellor would be a rash man who should propose to revive his predecessors' honoured custom of giving his state dinners on Sundays before the University sermon. He might make himself equally sure that modern decorum would frown upon any queen, regnant or consort, even if she were to be our present gracious sovereign, who should propose to diversify her visit to Cambridge by following the great example of Elizabeth, and enjoying a play of Plautus, performed on Sunday evening in King's College Chapel.

But perhaps the most striking picture of social revolution is given in the account of that famous Sturbridge Fair by which, within the living century, each recurring September was marked at Cambridge. Literary travellers never tire of taxing to their uttermost their powers of picturesque writing when their good luck leads them to Nijni-Novgorod at fair-time. They little think that perhaps within their own lifetime, certainly within that of their parents, an institution similar in its character, although of smaller dimensions, flourished within about fifty miles of London.

The casual reader may perhaps not resent being reminded that the thing most wonderful to modern ideas in these monster fairs was not so much the activity of the abnormal mart as the evidence which it offered of the impotence of the existing system of retail traffic. The growth of retailing in its higher aspects, while it killed fairs, created the compensating craving after "international" exhibitions, but there are not wanting signs that these monster collections of articles are destined to exist in history only as a passing phase of civilization. But to come back to Sturbridge Fair. In the days when it was at its glory, the shops at Cambridge were many of them open like stalls, closed at night, with a single wide shutter that let down and served in the daytime as the shopboard. But the fair of half a mile square had regular streets of stalls with quaint names, in one of which, the "Duddery," 100,000l. worth of woollen stuffs was said to have been sold in a single week, and elsewhere wool to the value of 50,000l. or 60,000l., and hops of a like amount. The University authorities opened proceedings with a dinner, at which the delicacies were herrings, a roast neck of pork, an enormous plum pudding, a boiled leg of pork, a pease pudding, a goose, a huge apple pie, and a round of beef. There was a sort of "Pie Powder" Court at which the Mayor presided, and on Sunday divine service was performed in the open space. The hall at which the wives of the heads of houses danced was a distinctive feature of the week, and plays were acted by the then famous Norwich company. The date of all this activity was September, which is a fair gauge of how far in those days the Long Vacation emptied Cambridge.

UNDER THE PUNKAH.*

IT would have required a deal of ingenuity to hit on a more misleading title for this series of stories or one more calculated to beguile the reader. A punkah, we need hardly say, is suggestive of that drowsiness which steals over Anglo-Indian domestic and official life. In one chapter only does the author deal with India at all, and it is entirely occupied with sight-seeing—Benares, Agra, Delhi, the Hills, and excursions on horseback, in postal carriages, or by rail. In Scott's preface to *Quentin Durward* there is an account of a French nobleman, the Marquis de Hautlieu, who persists in talking of the *Bride of Lammermore*, although reminded that there is no allusion to any such article from one end of that novel to the other. In the same way we here find nothing about untasted breakfasts, heavy dinners, and long hours in office only made endurable by the dull measured swing of the punkah, pulled by a coolly who constantly drops asleep or, lying flat on his back, just manages to keep the machine in motion, not by his hands but by his toes. At most of the scenes visited by Mr. Phil. Robinson a punkah was not needed and would have been quite out of place. About twenty years ago a very clever artist, Mr. O. Grant, did write about punkahs, and sketched them, to boot, with photographic fidelity. In his two works, *Anglo-Indian Domestic Life* and *Rural Life in Bengal*, this accomplished draughtsman went through the whole panorama of outdoor and indoor life. The bungalow, the Ryot's hut, and the Calcutta mansion; the bullock-carts, the coolies, and the earthen pots; servants of every degree, clothed, half clothed, or naked and in every conceivable attitude; trees, shrubs, and fruits; a date-palm, a blade of rice in full ear, and a stalk of indigo; were all drawn with a neatness, an accuracy, and a delicacy of touch which fully atoned for any blunders in the letterpress about such perplexing topics as land tenures or the cultivation of indigo. The hand of a practised workman was predominant in every page; and it is a pardonable exaggeration to say that in Mr. Grant's sketches the naked Aryan brother can be realized, and the hot weather and the glaring sunshine can be almost felt. In the volume before us we may well ask what possible connexion there can be between the punkah, and Hindu bathers at Benares or Dawk bungalows halfway up the hills?

We are sorry to add that some of the chapters are positively childish, others slightly vulgar, and two wholly sensational. We will take the latter first. In the wilds of Central Africa there is, we are told, a tree that lives on human flesh. We are not surprised to hear that there was something odd in the appearance of this tree; in fact, that it struck the narrator at once that he had never seen a tree exactly like it before. Neither is it to be wondered at that a herd of deer, with the keen sense of danger possessed by these animals, should swerve in their career and should sweep respectfully round the tree at some yards' distance. Ordinary human beings, of course, have not this insight into vegetable characters of a supra-natural kind, and we may remember that the attendants in the *Odyssey* were unconscious of the presence of Minerva, who was clearly seen by Ulysses the hero, and the dogs or mere brutes. Accordingly, an unlucky native lad who was trying to catch a wounded fawn, is caught by the thick foliage of the man-enter, and disappears from sight with "one stifled strangling scream." The author, however, is not so easily disposed of. Although the tree becomes aware of the presence of a second victim, quivers in every branch, mutters for blood, curls its fleshy palms, becomes hysterical with excitement, aways about its golden fruit, rocks, shivers and heaves, spurts out a vile dew (why not "ghastly," as in Mr. Tennyson's poem?), makes the ground to glisten with animal juices, and, in short, becomes a live beast in every sense of the word, the adventurous sportsman is fully equal to the emergency. He resorts to an expedient adopted by seamen when a waterspout comes unpleasantly near the ship in a tropical calm—he shoots it. He sends shot after shot into the soft body of the "mountainous monster with myriad lips" that was "mumbling" for his life. The trunk, we are happy to say, shudders; fruits fall down; large arms drop; fragments struggle, rise, and sink and gasp; and when the foolish leaves are audacious enough to continue the unequal contest, the gun is exchanged for the hunting-knife, which is buried in the soft bole, and this naturally settles the business. Like FitzJames in the celebrated encounter, the victor is left exhausted and breathless, unable to speak in the contest's close, but quite unwounded. The corpse of the little negro boy, Otona, is found after a long search amongst dead leaves, decaying fruit, and ghastly relics of former meals. Africa is selected as the scene of another adventure, intended, as the fat boy in *Pickwick* said to Mrs. Wardle, to make the flesh creep. There is a mysterious being in the primeval forest known as "the Soko," a man-beast, intelligent, cruel, and an eater of grain. The party, led by the author, journeys through forests that shut out the sun, enjoy excellent sport, see pale panthers and gigantic pythons, and experience considerable annoyance from puff-adders, centipedes, poisonous spiders, and ants. After a time the adventurers become aware that they are dodged by this mysterious being, which has the character of catching men and sometimes letting them go unharmed, varying this act of grace by now and then biting off the fingers, noses, ears,

* *Under the Punkah.* By Phil Robinson, Author of "In My Indian Garden," &c. London: Sampson Low & Co. 1881.

and torn off its skin, and then either strangling or hanging them up on trees. The upshot of the tale is that the sportsman who had set out to hunt the Soko is hunted by it instead. The animal, after following the author and hooting him for miles, presents itself in his path, like a true obstructionist; and at the very moment when Bhumari, the native attendant, had carried off the guns and left the writer with nothing but a short hunting-knife. This incident, we must admit, has an air of probability. Dozens of instances can be given by Anglo-Indians where the native bolts from his master at the exact moment when a wounded tiger or a she-bear robbed of her cubs requires one more bullet for the *coup de grâce*. However, the camp-fires are close at hand; the faithful followers come to the rescue at the most critical moment; and afterwards a grand hunt is organized in which the Soko is "ringed" as bears are in Norway when the snow lies thick on the ground, and the demon is shot, behaving in its last moments very much like an ordinary human being.

We cannot deny that the author in these two stories evinces considerable powers of word-painting and description. But there is too much of Edgar Poe in these details of blood-dripping trees, and of what Hindus would speak of as a gigantic Hanuman, with the stealthiness of the fox and the cunning of the man-eating tiger. Some of the other stories and essays are hardly worth detailed notice. They have, too, the merit or demerit of entire want of sequence and connexion. "My Wife's Birds" is nearly fit for the nursery. There is a manifest unsavouriness in an essay about noses and smells. "Death, the Daughter of Mercy," lacks point, for we are happy to say that a patient who has been racked with jungle fever is restored to health. And "Isto Puer" is apparently intended to parade all the effeminate objections to the sensible Bill proposed by the Home Secretary for the proper treatment and discipline of juvenile offenders. We shall now see what can be fairly extracted from the trips in various parts of India which took the author, not under the Punkah but very far away from it. It is not likely that a person of any attainments can go through India and have nothing new to tell. There is decided point in the observation that a passenger in an Indian railway train is a very good illustration of the British Power in India. We do not refer to an exploded sarcasm about the evidences of our supremacy being confined to empty beer and soda-water bottles. But there is something startling to native feelings in the standard of progress which every vigorous administrator is determined to keep up, if not to improve. We try to rush through Hindu stagnation as the train rushes through the plains. In little more than one generation we have replaced the track-boat by the steamer, and the palanquin first by the dawk carriage and next by the locomotive.

We sometimes move so fast, physically and metaphorically, that we have no time to speak to natives at the crossings, to penetrate below the surface, or to discover what they really want. Of course, the author while at Benares went to the Buddhist tope at Sarnath, saw the whole Hindu population taking its morning bath and muttering its prayers in the Ganges, and threaded the mazes of a town that contains more than three hundred thousand inhabitants. He also refers pointedly to the activity of Mr. Bird, who in 1809 put down what might then have been a total massacre of Mohammedans. This class provoked the Hindus to defile a mosque, and then retaliated on a temple in a manner which brought the whole population of Rajputs and others about their ears. The story, we are told in a note, is probably known in its authentic entirety to the author, who discovered it when editing the Benares Records for the Government of the North-Western Provinces. We do not doubt the author's accurate knowledge of the facts for a moment; but we might have been told by him that this same Mr. Bird rose to be Member of Council and Deputy-Governor of Bengal before that province was formed into a separate administration. Mr. Bird was more than forty years in the service, passed measures to abolish slavery and lotteries, was much trusted by Lord Ellenborough, staved off war with Burmah in 1841, and held the office of Governor-General for six weeks in 1844, between the recall of the above statesman and the arrival of Lord Hardinge. The story of the Benares Riot was one of Mr. Bird's favourite topics, and there are men living who can remember how the excellent President in Council and Deputy-Governor was accustomed to preface a long account of his praiseworthy activity as a magistrate by the ominous words "when I was a young man, at Benares, in the year 1809." Personal testimony is borne by the author to the frightful incidents of the famine which devastated some sixteen districts of the Madras Presidency in 1877, when the earth gaped in fissures, birds died or left the country, and nothing grew but except vultures and village dogs. But, when we are told that Indian peasants are not curious about birds or flowers and insects, and that fathers never familiarize their children with the works of nature, or explain to them the wonders of animal life in air, grass, or running stream, we are tempted to ask whether the same might not be fairly said of English rustics. Hodge and his fellows are not in sheer intelligence very much, if at all, above Ram Dhan and Gopal Sing; and in knowledge of the capabilities of the land he tills, and of crops and cattle, the Hindu peasant, in spite of unscientific ploughs and ill-made hoes and mattocks, is quite the equal of the labourer to whom we are going to hand over the representation of our counties. There is an error in the remark that a male child is essential to the happiness of a Hindu, as, falling male

being, he has "no one to lead his soul by the hand to the land of the dead." Rather, we should say, he has no one to deliver him from that land. *Putra*, a son, say the Hindu law-givers, is so called because he delivers (*tra*) his father from the Hell called *Put*. The derivation may be fanciful, but the idea is rooted in the Hindu mind, and hence the insatiable desire for a son of the body, or, failing him, for that adopted son who has been such a source of perplexity to legislators and statesmen. The contrast between Lucknow and Futtahpore Sikri is well drawn. At Lucknow everything is tawdry and second rate. The *Martiniere* is an odd building, and the palaces on which incorrigible Nawabs, turned by us into kings, long squandered their revenues are ill designed and ill kept up. Futtahpore Sikri is worthy of the genius of Akbar, incomparably the greatest of the Mogul sovereigns. Professor Palmer has just reminded us of the grim and ferocious humour of the real Harun-al-Rashid as distinguished from that imaginary sovereign of the *Arabian Nights*. Few outbursts of caprice or savage retribution disgrace the fame of Akbar; and the solid red stone, the noble architecture, the delicate tracery of the white marble, and the vastness of this abandoned city, some twenty-two miles west of Agra, leave an impression of power and lend credit to the traditions about its founder still lingering in the Doab of Hindustan. On the whole we prefer the sketches of Indian scenery and Indian life to tales about animals that hunt men and trees that resemble the octopus. Cawnpore, we may state in conclusion, is not renowned in India "as the metropolis of the hunters of the mighty boar." There is no great preserve of these animals in the Doab, and no boar bred between the Jumna and the Ganges can be compared for size, strength, and audacity with the boars of the Deccan or of Eastern Bengal.

QUEENIE'S WHIM.*

THERE was once a clever schoolgirl with a lively imagination. It was her pleasure to amuse her schoolfellows in bed at night when the candles were put out, or in the garden on a warm and sunny half-holiday, by telling them stories. These she invented and made up all out of her own head, having as yet a very small experience of mankind, and holding what may be, not unkindly, called narrow views of man and his more common attitudes of thought as regards women. The stories mightily pleased her listeners; once or twice they came to be quite long ones, taking a great many nights in the telling, flying off into unexpected episodes and introducing such a crowd of characters, that it was difficult to remember who they all were, and some of the girls had to be continually reminded of the cousinships which ticked them off like a long list of *dramatis personæ* in an old play. But it did not greatly matter how many characters were introduced, because it was only necessary to think of one or two at a time; the sufferings of one group could be taken by themselves; the important thing, which the narrator never forgot, was to have plenty of weeping, crying, sighing, sobbing helplessly, wringing of hands, turning pale with despair, wasting away with sorrow, refusing to eat, even pushing away the teacup with loathing, all for disappointments most unexpected and disasters most cruel. Schoolgirls, as is well known to all who have read their favourite novels, reverse the maxim of one who certainly did not write for them; they would rather read of tears than of laughter; they do not greatly care for things humorous or comic, or even gently funny; they are never so happy as when people in the story are thoroughly miserable. Now, in one of these long narratives made up "all out of her own head" by this girl with the lively imagination, the crying hardly ever stopped at all; now and then there was a pause during which every girl had time to dry her eyes, repress the latent wave of sympathy, and prepare herself for something much more dreadful, which duly came in the next chapter; the story-teller's voice was frequently choked with sobs; everybody's pillow was wet through with tears, and next day's lessons were clean forgotten in thinking over the woes of the poor, much-tried heroine. Great glory and praises many were lavished upon the story-teller by her schoolfellows. Unfortunately she was not content with the honours of a small circle, but yearned for that of the outer world, and wrote down her novel, and persuaded a publisher to print it.

Such is the history of this novel, derived from internal evidence. On no other hypothesis can we understand its production. It must be, it cannot but be, a story told without previous meditation, without thought, without plan—a story metaphorically, if not literally, told altogether in the dark. It is in every point exactly the kind of story which a schoolgirl would tell; it betrays, with an artlessness which is juvenile, yet not remarkably attractive, the views which a schoolgirl would naturally entertain on life, love, duty, happiness. The heroine's name is in itself an indication of the kind of book. It is not a pet name, or an abbreviation of anything; it is her actual name, her only name. What can be expected from a "Queenie," of reality, common sense, or fidelity to life? We know her beforehand; how self-conscious she is, how exaggerated in her virtues, how she revels and rolls in her little affectations, how she loves to be talked about, with what resignation she endures persecution, how gently she turns the other cheek for the unkind buffets of fortune. The Queenie of this book—she with the whim—does not disappoint us; she is all

* *Queenie's Whim*. By Rosa Nouchette Carey, Author of "Nellie's Memories," &c. 3 vols. London: Bentley & Son.

that we expected, and more; she is, indeed, so familiar as to seem almost old-fashioned. That is, perhaps, her greatest fault. She is a thing of the past; under various names, she has been done so often, and done so much, that she is done to rage.

The story is not of so exciting a character that we are breaking confidence in revealing it. It opens at a boarding-school for young ladies, where Queenie is a teacher. It is one of those schools common enough in ladies' novels twenty years ago, but gone out, we had thought, in these days of girls' high schools and examinations, in which the mistress and most of the teachers are represented as contemptible and odious. Queenie gives her services, and pays a little money besides, in return for board and the education of her little half-sister, who is, of course, treated with insufficient food and general harshness. They are orphans—every one knows how difficult parents are to manage in a novel. Their father was "Frank Marriott"; every man in the story has his full name given him, after an unreal fashion, which we hoped was quite gone out. When will ladies understand that men are only spoken of by their Christian names to distinguish them from brothers, or from other persons of the same name, or because their surname is Brown or Smith, which *must* have a *prænomén*? The father's second wife had a brother, "Andrew Calcott," who had a confidential clerk, "Caleb Runciman," both being habitually known and addressed by their Christian as well as their surnames. This brother disliked his brother-in-law—it is not stated why, but it was, no doubt, because he had called his first child "Queenie"—and after the manner of such brothers, permitted himself the luxuries of "bitter passion" and a "terrible oath" that none of his money should go to his sister. When the sister, with her husband, was dead, this unnatural uncle of the good old kind used to scowl at his niece, the younger child, if he met her with her sister. They were "Frank Marriott's" children. When Emmie, who has been punished for inattention, cries and gets thin, Queenie calls upon this interesting old person, and, with great dignity, upbraids him for his cruelty. He naturally gets into a rage. She informs him, further, that his alienation was the cause of his sister's death, which really seems a most groundless charge. When he orders her to leave him, she deals the last and heaviest blow. She tells him that his niece, her half-sister Emmie, always prays for him. This is too much. "The veins of his forehead were swollen and purple, the twitching of the mouth increased, a strange numbness seemed creeping over him. That night Mr. Calcott was alarmingly ill."

And now begin the first tears; Emmie is locked up alone for some misconduct, and of course is taken ill and nearly dies; Queenie has an excellent chance of showing a victim's contempt for her tormentor when she leaves Miss Titheridge; she is sent for by Mr. Calcott, now ill, but still persuading himself that he hates his niece; she reads to him; she is desperately forgiving in her manner and he is naturally rude—any man of spirit would resent being forgiven with so much ostentation. Then the girls go on a visit to a certain village where the rest of the story takes place. This place is peopled by a very remarkable collection of folk. They have all had some love disappointment. Imagine a little country district in which everybody's love affairs have gone wrong. The idea is so good that in the hands of some novelists it would have proved a gold mine of amusement; needless to say that such is not the schoolgirl treatment. The most beautiful opportunity is quite wasted and thrown away. There is first Langley, the young lady of thirty or so whose smile is a "flicker" and whose face is weary under the "pressure of some carking care;" Garth, her brother, a king of men who thought himself, but was not, in love with Dora Cunningham; the Vicar, of forty-five or thereabouts, who is hopelessly in love with Cathy, of eighteen; Miles, the schoolmaster, who "has got a history," which, so far as we remember, remains unveiled; Mrs. Morris, who has lost her husband; Faith Palmer, of thirty-five, whose love affair was nipped in the very first budding and promise of it; Captain Raweett, who has been otherwise wounded, and laments, with too long tears, his little daughter; Mr. Chester, who has married the wrong woman; Charity Faith, who had been obliged to give up her lover, and afterwards had the pain of seeing him take to drink; and Dora Cunningham, with whom Garth fancies himself in love. Perhaps there are others, but the list is exhaustive enough, and it will be seen that here are materials for very comfortable and substantial misery all round. The first thing Queenie does is to accept the post of village schoolmistress; here, again, an excellent opportunity is lost, because there would seem, to one who considers the thing seriously, no situation more ludicrously irksome than that of a young lady managing village children all day long; and in the end child murder would probably happen. But the authoress does not so consider things, and wastes another good chance. In this position Queenie makes the acquaintance of Dora Cunningham, who wants to patronize her and fails; here, too, occurs the first death—that of Mr. Chester's daughter, little Nan. In this painful episode Queenie comes out really strong. Then she learns that her sister's uncle, Andrew Calcott, has died—the good old man—and left her five thousand a year. She resolves, after consideration, to say nothing about this windfall, and goes about her duties buoyed up even against the patronage of Dora Cunningham by the consciousness of her wealth. This is, in fact, her "Whim." Faith Palmer's old love turns up as the new doctor of the village, and presently renews the old love. This is an agreeable episode, told with some spirit. The death of little Nan—the narrative, about this point, becomes

a good deal better, owing to a population of the author's last character with just a touch of a real distinction between Mr. Chester and his wife, so that when the latter shortly afterwards dies we are let down more really; but, it makes the way plain for Langley's happiness. Then Garth gets into money difficulties, and wants the loan of £500. Queenie goes to the Vicar, confesses, with enormous enjoyment, the situation, and gives him the money to lend Garth. Then she goes back to her school, and the Vicar's sister presently lets out the secret. Garth, discovering that he has been befriended by the girl he loves, instead of being grateful, and pleased to think she has got so much money, grows bitter towards her, unconsciously illustrating the maxim that gratitude is the most uncomfortable of all the virtues for daily wear. Then Emmie dies, quite needlessly, taking two or three chapters all to herself and Queenie's sufferings. After more tears than we remember to have encountered in any other three volumes, Garth marries Queenie. They have, so far as we get by the end of the book, two children, a boy and a girl; and the concluding paragraph shows more wisdom than all the rest of the book put together, for in it the proud father resolves not to call his daughter Queenie. Dora Cunningham arranges good marriages for her younger sisters, and then marries a wealthy widower. The Doctor has already married Faith. The Vicar marries Cathy. And, in fact, everybody is married. It is impossible to find fault with a book which, in the end, makes so many worthy people happy. We hope we have set forth faithfully such characteristics of the story as may explain whatever popularity awaits it.

THE LIFE OF GEORGE IV.*

IT is not easy to conceive what good purpose can be answered by these two bulky volumes. In nearly nine hundred closely-printed pages we have told us the life of one of the most worthless of men. Could any man of real power have condescended to write the Life of George IV., no doubt he might have given us at the same time a valuable sketch of the history of the times. But what man of power would have chosen such a poor peg on which to hang his narrative? The part that George IV. played in the history of our country was most unfortunately by no means unimportant. He was often in a position to do a great deal of mischief, and he scarcely ever missed his chance. Nevertheless, his public deeds are better described in the general history of England, or in the biographies of the eminent statesmen whom he so often played false. His private life is none the less contemptible because it exhibited every form of profligacy on a big scale. The time has surely come when it may with advantage be consigned as quickly as possible to forgetfulness. Mr. Percy Fitzgerald is not, however, of this opinion. No paragraph in any book that in any way concerns his hero can be too trifling to escape his pair of scissors. He has searched far and wide, and has gathered into one vast pile a heap of the most foolish and impertinent details. Our readers may remember the admirable scene in Mansfield Park where Mrs. Rushworth shows her visitors over her house. She takes them into the private chapel, and thus, in accordance with her custom, began:—"This chapel was fitted up as you see it in James the Second's time. Before that period, as I understand, the pews were only wainscot; and there is some reason to think that the linings and cushions of the pulpit and family seat were only purple; but this is not quite certain. It is a handsome chapel, and was formerly in constant use both morning and evening." Much, very much, that Mr. Fitzgerald tells us is of about the same importance, though, we regret to say, it is not always expressed in equally correct English. He begins his book a few hours before "the birth of the royal child." His style at once rises up to the full importance of the great event. "The office of assisting her Majesty through the crisis was," we read, "delegated to a simple midwife." In a footnote we are told that this simple midwife was Mrs. Stephens. Let not the reader who has studied "the publications"—whatever they may be—imagine that it was Mrs. Draper. In them Mrs. Draper is indeed mentioned; but she was, not the Queen's midwife, but the Prince of Wales's nurse. Should the reader still prove incredulous, let him turn to p. 8 of Vol. I. of Huish's Memoirs of George IV., and there he will find full authority for Mr. Fitzgerald's statement. Having got clearly into our heads the difference between Mrs. Stephens and Mrs. Draper, we were not a little puzzled by a long footnote that Mr. Fitzgerald gives us only two pages later. There we read that the royal child, the future prince, the smiling infant, the heir to the Crown, the future "first gentleman of Europe," the royal infant, the new hope of the kingdom, the royal nursing, as we find him indifferently called in a couple or so of pages, had "two selected nurses, wet and dry." They were Mrs. Scott and Mrs. Chapman. What, then, has become of Mrs. Draper? We must leave this difficulty to be cleared up either in some future edition or by some second biographer. We pass on, or rather we return, from the litter of these footnotes to the christening, merely to remind those of our readers who may be a little rusty in their history that one of the godfathers, the Duke of Mecklenburgh-Strelitz, was not present in person, but was represented at the ceremony by the Duke of Devonshire.

* *The Life of George the Fourth: including his Letters and Opinions, with a View of the Man, Manners, and Politics of his Reign.* By Percy Fitzgerald, M.A., F.R.S., Author of the "Life of Garibaldi." 2 vols. London: Tinsley Brothers. 1891.

It is true, we travel at the slow rate at which we have hitherto gone, and longer even each anecdote of the royal child's private life, we shall scarcely arrive even at the time when the life of the kingdom was breeched. We accordingly skip a few years and come to what was, if we may trust our author, "perhaps the most interesting event of his childhood—the meeting with Dr. Johnson." From Dr. Johnson Mr. Fitzgerald, who, by the way, is known as having published an edition of Boswell, by an easy transition takes us back to Queen Anne. "The Doctor," he writes, "who spoke to him some grave words of encouragement, had thus been in some sort of communication with five sovereigns. He had been touched for the evil by Queen Anne; he must often have seen the First and Second Georges in the streets of London; with the Third and Fourth he had spoken." Why Johnson, who, so far as is known, never visited London from the day he was touched by Queen Anne till almost ten years after the death of George I., must have often seen that King in the streets, Mr. Fitzgerald forgets to tell us. It is certainly a curious blunder for a man to make who has edited Boswell. Some sixty pages or so later on we come to the stanzas that Johnson, "the sage," as he is here called, wrote on a Spendthrift. What, the reader may well ask, have these verses to do with a Life of George IV? The answer is an easy one. They were written about a certain Sir John Lade, who "was, we are told, the Prince's tutor in the art of driving." It is certainly somewhat more to the point when, in giving the list of the Prince's tutors in polite learning, Mr. Fitzgerald gives us also the names of some of those who instructed his father. Among others we learn that George III. was taught grammar by Mrs. Trimmer. This may be the case; if so, it is only another proof of the affability of that amiable monarch, that he submitted to study grammar from a lady who was two or three years his junior. Perhaps it was after he discovered, when he came to write his first Royal Speech, that he could not spell "Briton" that he engaged a governess. But to return to our Prince, from whom, following our author's footsteps, we are constantly wandering. We are sorry to find, if Mr. Fitzgerald's words are to be taken as common English, that the Duke of Wellington had a very bad influence on his Royal Highness. The Prince on one occasion owned that he did not speak the truth, and that he had been taught to equivocate by his mother. "No one," adds our author, "corroborated this candid confession and defect so heartily as the Duke of Wellington." There was no harm in corroborating the confession, if, that is to say, a confession can be corroborated; but to go beyond this, and to corroborate the defect, and to corroborate it heartily, shows an indifference to truthfulness in the Duke which is as surprising as it is shocking.

We cannot follow our hero through his youth and his early manhood. Those who are fond of reading the lists of people of title will find in these two volumes not a few quite as long and quite as interesting as the one we will now quote. Mr. Fitzgerald is describing, we may say by way of preface, a ball at St. James's Palace:—

The list of couples was sometimes after this fashion: The Prince of Wales standing up with the Princess Royal; the Duke of Cumberland with Lady A. Campbell; the Duke of Dorset with Lady Salisbury; Lord Rochford with Lady Stormont; Lord Graham with Lady Francis Smith; Mr. Greville with Lady Aylesford; Mr. North with Miss Bradwith; Colonel St. Leger with Miss Nottis; Mr. West with Lady Talbot; and Mr. Lumley with Miss Woodley.

This arrangement, it will be noticed, was highly select, and only allowed of but a few dancing out of a large crowd.

It would have been well had our author been content to give the name, and nothing more, of nine-tenths of the Prince's associates. But there are few who are so worthless, so utterly contemptible in every way, as not to be deemed by him to deserve a paragraph, if not indeed a whole page, provided that they and the hero of the biography had any dealings with each other. Thus, Chapter XXII. opens with these words:—"It can scarcely be understood how passionate and successful a follower of racing was the Prince of Wales." To bring this great matter down to the reader's feeble understanding, Mr. Fitzgerald quotes a passage, that fills four of his full pages, from "*Genius Genuin*," by Samuel Chifney, of Newmarket. "What kind of rubbish it is that has been swept together to help to form these volumes will be seen by the following passage from the writings of this jockey:—

"As I came from scale," says Chifney, "I was told that Mr. W. Lake (brother to Lord Viscount Lake, and the gentleman who had the management of the Prince of Wales's running horses) had been saying something improper to his royal highness concerning Escape's winning; I made it, therefore, my business to go immediately to his royal highness, who was riding with a gentleman near to the Grand Stand House, and he immediately accosted me in the following words: 'Sam Chifney, as soon as Escape's race was over, Mr. Lake came up to me and said, 'I give your Royal Highness joy; but I am sorry the horse has won, I would sooner have given a hundred guineas.' I told Mr. Lake that I did not understand him—that he must explain himself.' I then answered his royal highness, saying, 'Yes, your Royal Highness; it is very necessary that he should explain himself.' This is all that passed on the subject to-day."

It is a loss of time and patience to follow our author through what he calls his "View of the Men and Manners of George's Reign." Let us turn to examine his view of politics. As we read on we were amazed to find what little notice he took of the French Revolution and the great war with France. He reminded us of the man of even mind who had been in Paris through the whole of the Reign of Terror, and who declared at the end of it, when he was asked how he had felt, that he had not noticed that anything unusual had gone on. We turned to the Index that Mr. Fitz-

gerald provides to see whether we had completely passed over some notices of these great events. We found in it no heading of France, French Revolution, Lewis XVI., Napoleon, or Bonaparte. To William Pitt just twelve references are given and no more. Meagre though the view is of politics, yet we could have wished that it had been more meagre still. He would have done well, indeed, had he left them altogether on one side, and had stuck to men and manners. On page 30 of his first volume we find the following amazing statement:—

In the following year, 1728, the King had been compelled to dismiss the North ministry, and in a sort of agony of reluctance to accept Lord Rockingham and the Whigs. A year later the death of this nobleman had brought Fox into power as foreign secretary.

The carelessness in the date is bad enough, but the error is so grossly absurd that we will allow the author to shift it on to the printer. But what are we to say to an author who writes two huge volumes on the times of George IV. and maintains that it was the death of the Marquess of Rockingham which brought Fox into power? What was it, we may ask, which brought Fox out of power? We pass over the minor blunder by which Rockingham's life and administration are extended by a whole year. In another passage Mr. Fitzgerald says, "It is a remarkable fact that four most conspicuous men, who all filled the office of Prime Minister, should, during a short period of about thirty years, have condescended to expose their lives in this fashion" (in duelling, that is to say). The first on his list of Prime Ministers is Mr. Fox! As a heading to each chapter our author gives the date. It is a good practice if the entry happens to be correct. But, unfortunately, Chapters XIV. and XV. of the first volume are assigned to 1789, while they really belong to 1788. There may possibly have been some temptation to throw as late as possible the affairs described in the latter of these two chapters; for we read in it that a debate in the Lords "was remarkable for Lord Shelburne's (now Lord Lansdowne) brief but admirable summary of the question." But, after all, what does a year more or less signify in the almost antediluvian age of this venerable nobleman? It is all but a hundred years since he thus so admirably summed up, and, though he has changed his title, we have him still among us. To pass from dates to geography, we find Mexico and Columbia described as South American colonies. For Columbia, our author, no doubt, means Colombia; but for Mexico, no explanation, we fear, can be found. Even her Majesty's name is not given correctly by him. He tells of her christening, which, in accordance with the plan of his work, he was certainly bound to do, as the Prince Regent was present, and says that she was named Alexandra (*sic*) Victoria. The passage in which he describes her birth we will quote as an instance of the strange English that he too often writes. How strange it is must be known to all who have tried to read his Life of Garrick. He, it is clear from internal evidence, never had the benefit of Mrs. Timmer's instruction in grammar.

This event—the birth of the future Queen of England—seems to have been considered but of slight importance, probably on account of the poor estimation in which the Duke was held, or being perhaps considered certain that the Duke of York would inherit, and that the recently married Dukes would have children, the Duke of Kent being only the King's fourth son.

(One or two more specimens will sufficiently illustrate our author's style:—"Almost as soon as he arrived he wrote to Loughborough, begging him to come to him to arrange some plan of action; but that he had not seen or heard from the Prince, and had no authority." "It was when he was at Weymouth that the military taste of the kingdom was enlisted by the behaviour of the First Consul." "It was the last, and probably will be the last, that was carried out on such a scale and with due attention to the old and chivalric theatrical elements of the ceremony." "It was in his relations with certain remarkable men of mark and judgment that he really shone, and such he always impressed in the most favourable manner." "Reports of his conversations with these performers show a rational spirit, with a wish for gathering such information and entertainment as they could furnish, and without any sacrifice of dignity." The Art of Sinking has certainly not been alighted in the account that Mr. Fitzgerald gives of Regent Street. "Stucco and paint may indeed be the chief 'notes,' but there is a dignity and effect that is not unworthy of a great city, or of a leading and busy quarter full of glittering shops." With this quotation we will take leave of him, his hero, and his book. But let us not part company from all three without one word of praise. In one respect, our author on almost every page reminds us of the man whose life he writes. There is "padding" enough in these two volumes to have satisfied the taste, not only of the King himself, but even of his valet and his tailor.

OXFORD UNDER THE COMMONWEALTH.*

THE book before us is a very creditable piece of work. It concerns a most important and interesting section of University history, hitherto very little known, except to those few happy persons who are familiar with the Oxford treasures of the Bodleian, and Professor Burrows has succeeded in treating it with the proper mixture of readableness and thoroughness. The Register of the Visitation of Oxford under the Commonwealth does not indeed

* Register of the Visitors of the University of Oxford, 1647-1658. Edited by Montagu Burrows, Chichele Professor of Modern History. Printed for the Camden Society. 1881.

appeal to a popular audience, nor did those concerned in its publication address themselves to such. Professor Burrows's work has been done, not for the general public, but for the Camden Society, and his book is a model of what such a publication for an Historical Society should be. The text of the Register is printed from the unique MS. volume in the Bodleian, Professor Burrows allowing himself the chronological re-arrangement of some of the entries, but otherwise printing scrupulously after the original. The Register itself is provided with useful footnotes, explaining the context and connexion of the more important entries; it is followed by elaborate tables of the individuals whose names occur in it, and it is preceded by an introduction which, if here and there a little diffuse or irrelevant, is in the main clear and interesting account of an extremely puzzling time. It is very much to be wished that others of the numerous documents of Oxford history, which survive still unpublished in Oxford archives, should find as painstaking an editor as has now fallen to the lot of the Register of the 1648 Visitation. As Professor Burrows points out in his preface, nothing of any importance in Oxford history has been attempted since Wood died in 1695. We have had notes upon Wood, isolated collections of letters and numerous biographies. In the Bodleian the long row of MS. volumes of Hearn's diary have been recently indexed, and stand now waiting for the specialist who will make intelligent use of the confused and unequal material they contain. Of other documents of all kinds, both MS. and printed, the same library shelters an abundant store. Some years ago it seemed likely that admirable use of these materials would be made by an antiquarian Fellow of Queen's College, whose early death in 1870 annihilated an accumulation of learning on Oxford history, especially on the history of the seventeenth century, hardly to be matched again. He had published little when death overtook him; but an article on the ceremonial of old commemorations in *Macmillan's Magazine* was long remembered by Oxford men, for its mixture of curious learning and quiet humour; and he wrote besides a number of essays on old Oxford in the *Undergraduate's Journal*, which gave promise of more important work to follow. His peculiar gifts seem as yet to have found no successor. What Mr. Robinson might have accomplished alone may yet, however, be achieved, if not by one worker, by a body of workers. What is wanted is an Oxford Historical Society, which should take as a starting-point the publication, in part or as a whole, of Hearn's diary. Such a Society would certainly find workers and supporters, and in the present reviving condition of historical study at Oxford might fairly be expected to rouse the enthusiasm of those to whom that "home of lost causes and forsaken beliefs" is dear and familiar.

Professor Burrows divides his introduction into five chapters, dealing with "Antecedent Oxford History," "The General Character of the Visitation," "The University on its Defence," "The Visitors at Work," and "The State of Oxford Colleges." In his sketch of Oxford history during the latter half of the sixteenth century and the early years of the seventeenth, we are led rapidly through the Calvinistic days of the University, when, under the influence of Leicester's chancellorship, Puritan principles took a strong hold upon the place, to the decay in discipline and energy which marked the opening portion of James I.'s reign, followed by the growth of Arminianism, and the tyranny of Church and King under which Oxford was held during the decade of Laud's chancellorship from 1630 to 1640. The question which such a survey naturally provokes, and which is to a certain extent answered by the Register of the Cromwellian Visitation, is, What became under Laud of those Puritan and Calvinistic elements which before 1630 are found so strongly represented? About 1610, Wood speaks of Magdalen College as "a nest of Puritans." About 1622 we find Arminianism widespread indeed, but still "disrelished by the majority of Academians." But from 1630 to 1640, under the resolute government and "weeding out" practised by King and Chancellor, Puritanism practically disappeared from Oxford. Frideaux, indeed, the eminent Calvinistic Regius Professor of Divinity, and Head of Exeter, remained to be rated and persecuted by Laud, and the halls seem to have sheltered a certain number of malcontents; but in the colleges generally Arminianism reigned supreme. It is evident, however, from the records of the Visitation that the moderate Puritan party, represented after Laud had done his work of persecution and exclusion by the Presbyterians, had been only temporarily silenced, that many of them were biding their time at Oxford, and others outside Oxford, and that during the Visitorial government of the University this middle party, as distinguished from Arminians on the one side and Root-and-Branch men on the other, gradually emerged into much more than their old influence and activity. The Parliamentary Visitation, therefore, instead of appearing as an abnormal interruption in Oxford history, assumes to some extent the aspect of a return to an earlier state of things. Oxford, indeed, was Laudian and Cavalier when the Visitation came down upon it, as befitted the city which had been so lately the King's Court and stronghold; and the conscientiousness of the Laudian members, as well perhaps as the strength of their still surviving hopes for the Royal cause, were attested by the staunchness with which some four hundred Heads, Prebendaries, Fellows, and Scholars suffered expulsion at the hands of the Parliamentary authorities rather than sign the required declaration of submission. But the important point to notice is that the Visitors seem to have had no lack of good men of their own ready to import into the places thus vacated. As Professor Burrows points out, the Heads imposed by the Visitors were at least equal in character and attainments to those they ejected; and in general their ap-

pointments to University posts suffered from no want of eligible persons to appoint. Such men as Reynolds and Comant would have done honour to any system or party; and professorships and lectureships were never better filled up in old Oxford than they were under the Visitation. So it came about, to Lord Clarendon's astonishment, that, in spite of the "wild and barbarous depopulation" effected by the Visitors, in spite of their reign of "stupidity, negligence, malice, and perverseness," the University, under their government, "yielded a harvest of extraordinary good and sound knowledge in all parts of learning." The true explanation of the whole phenomenon seems to be that the Visitation by no means represented such a break with the University past as is suited later University fanatics to imagine. The Laudian extreme was followed by the Root-and-Branch extreme; but, when both were passed, a body of men rose into power representing the broad middle stream of English cultivated opinion emerging from temporary rapids, as it had emerged before, and as it has often emerged since. The passage to this comparatively successful and peaceful period was not achieved, however, without a severe struggle, of which an entertaining outline is given in Professor Burrows's second chapter. The surrender of Oxford to Sir Thomas Fairfax took place in June 1646, the treaty of surrender stipulating for the freedom and privileges of the University, but at the same time containing a distinct intimation on the side of the Parliament of their intention to "reform" the important corporation thus placed at their mercy. It was, indeed, as the new rulers of England saw, all important to secure the Universities, then far more powerful politically than they can be now in the days of great manufacturing towns. But they set about the business with feebleness and hesitation, the inevitable consequence of the uncertain political situation. The autumn of 1646 was spent in endeavouring to preach the University into a proper frame of mind to receive a Commission. Oxford men may at least note with satisfaction the disappearance of this particular weapon from the reforming armoury. The terrors of a University Commission are still great; but among them are not now included two-hour sermons at St. Mary's. Nor did the sermons accomplish much. The Cavalier University scoffed and went its way. At last, on May 1st, 1647, an ordinance was passed by Parliament "for the Visitation and Reformation of the University of Oxford," and "the due correction of offences, abuses, and disorders, especially of late times, committed there," the task being entrusted to a Board of twenty-four Visitors, of whom fourteen were laymen and ten clergy. The Visitors chosen were mostly University men, some were lawyers, and some country gentlemen from the neighbouring Midlands. Only a minority of them, as Professor Burrows points out, "were persons of any importance." Among these latter we may mention Prynne; Reynolds, afterwards Vice-Chancellor; Francis Obeynell, a controversialist and preacher of some mark; and Sir Nathaniel Brent, who had been ousted by Charles I. from the Wardenship of Merton in 1645, to make way for no less a person than William Harvey. On May 15 the newly-appointed Commission began its work by citing the whole University to appear before them in Convocation on June 4th. But the University, marshalled under the guidance of the stout Dr. Samuel Fell, father of the equally stout Dr. John Fell, who made Locke's life so uncomfortable to him, was not to be caught so easily, and this first move ended in a fiasco. One of the long sermons in which the Puritan mind delighted detained the unsuspecting Visitors a few minutes beyond the appointed hour of eleven o'clock. The University authorities, who had, of course, declined the sermon, had calculated adroitly upon the copiousness of Presbyterian eloquence, and were not disappointed. Punctually to the moment the University procession left the Convocation House, only to meet the Visitors in the Proscholium hurrying to their appointment. "Room for Mr. Vice-Chancellor," cried the Bedel, and the Visitors falling back, the triumphant Vice-Chancellor swept past them with a civil but crushing remark on the position of the clock. This first scene belongs to comedy, but the situation was in reality serious enough. The University had had nearly a year to organize itself, and proved now an extremely tough morsel to deal with. Its delegates, drawn from the ablest men of the defeated party—Fell, Sheldon, Hammond, Morley, Sanderson—drew up the reasons of the University against the proposed Visitation, with a dignity and force extremely difficult to meet with weapons of argument only. And to resistance within were soon added political complications without, by which the action of the Visitors was paralysed for at least another three months. At last, in September, they procure additional powers and begin again. The Register of their proceedings reopens on September 30 with an order to the Heads of houses to appear before them, bringing the official books of the various colleges. But this second attempt fared no better than the first. The Heads proved altogether impracticable, and early in October the University delivered a formal reply to the summons of the Visitors which amounted to an absolute *non possumus*. Dr. Fell was especially vehement in his opposition to a body which, with characteristic Christchurch hauteur, he denounced as composed of junior and inferior men. "Am I to stand, cap in hand, to my own Student?" he is reported to have asked with reference to Mille, a Student of Christchurch, who was a member of the Board; and this feeling was no doubt shared by many others among the recalcitrant Heads. At last nothing remained but to refer the matter to the London Committee which had been appointed as a Parliamentary Court of Appeal for the Visitation. The result of their intervention was seen in the summons of Fell to London, followed by his

summary arrest and imprisonment. But for a time the Visitors fared no better, even after Fell's withdrawal from the scene. His deputy, Dr. Potter, carried on the war vigorously, and the Visitors were gradually reduced to impotence. They forbade the meeting of Convocation, but Convocation met in spite of them. They prohibited professors from lecturing; but the professors, instead of obeying, became seized with a lecturing zeal altogether foreign to the professorial character. The truth was that quarrels were raging at headquarters between Presbyterians and Independents, and that in the autumn of 1647 the King was still a power, still to be reckoned with in any calculation of the future. The lesser struggle at Oxford hung upon the larger, and the issue had not yet declared itself decisively enough to enable the Parliamentary party, either in the country or at Oxford, to act with unity and effect.

But with the spring of 1647-48 the situation changes. In spite of the troubles of what has been called the "second civil war" of that year, the vigorous and successful measures at last adopted at Oxford in the three spring months of February, March, and April are a measure of the growing Parliamentary strength. Reynolds was appointed Vice-Chancellor, the old proctors were superseded by nominees of the Visitors, and the authority of the Chancellor was at last invoked to carry out the decrees of the Visitors in regard to these and numerous other appointments. On April 11th the Chancellor, Lord Pembroke, a man of rough and unamiable character, arrived upon the scene, and the three days which followed marked the turning point of the drama. Soldiers were called in, who, finding that Mrs. Fell held the Deanery at Christchurch for her husband, were perforce obliged to carry that valiant lady in a chair to the quadrangle, and whose business it was in general to eject the ousted Heads and prebendaries by force, if necessary, and to instal the new officers. Great progress was made in this disagreeable but inevitable process during the three days of Pembroke's stay at Oxford; and when he left, the Visitors, backed by the strong arm of the town garrison, and surrounded by new men of their own party, were at last able to make themselves felt. The register of their proceedings begins again on March 17th, 1647-8, and becomes continuous for some years. In May a citation to all members of colleges to submit to the new authorities was issued, and upon the basis of the answers received to this citation the reorganization of the individual colleges proceeded. The register, as published by Professor Burrows, largely consists of the answers given by Fellows, lecturers, scholars, and servants to the set question, "Do you submit to the authority of Parliament in this Visitation?" The most varied ingenuity is displayed in these replies, and their tone ranges from the jaunty Cavalier defiance of Jesus College to the staunch Puritanical fervour with which the Halls for the most part hailed their new governors. Nicholas Pitt, of Queen's College, answers as follows:—

To the pretended Visitors of this University my Answer is negative, that I will not, neither can without abusing the King and therein my own conscience, submit to you as Visitors, whom his Majesty doth profess his enemies: Thus stands the conscience of Nicholas Pitt.

Nicholas Pitt was evidently a person who knew his own mind. The next specimen we shall choose is a delightful example of the wordy evasions with which the Visitors found it extremely difficult to deal. William Dureton, Olericus, of Magdalen College, replies:—

By non-submission to this method of visitation I shall, I feare, nawfragate the present substance I now enjoy, which is all I have in the world: But if I doe submit, it being both repugnant to my practical judgement and contradictory to the many oathes I have taken in the Universities, I shall, I feare, being not yet abolved, incurre that damnable sin of perjury, a sad dilemma, but yet I resolve to observe that Aphoristicall Edict *Ex duobus malis minimum eligendum*.

Many of the answers were, however, much more ambiguous than this of William Dureton, and the Visitors saw themselves at last obliged to send a classified list to the London committee, that they might decide what were submissions and what were not.

In all it appears that about four hundred members of the University, Heads, Prebendaries of Christchurch, Fellows, Professors, and Scholars were expelled, the greater part of them probably within 1648 and 1649. When this process was once over, the Visitors proceeded to the work of reconstruction and discipline. The discipline they enforced was of a stern and Spartan type, of which the mere outline would be enough to terrify the weaker vessels of the present generation. But they were not mere theological martinets. Learning flourished under them, students flocked to Oxford, the moral tone of the place was admittedly excellent. While the irreconcilable John Fell, son of the dispossessed Vice-Chancellor, complains bitterly of Cromwellian Oxford as housing an "illiterate rabble, swept up from the plough-tails, from shops and grammar-schools and the dregs of the neighbour University," a far better witness, the commentator Matthew Henry, himself of Royalist stock and son of a non-submitting student of Christchurch, speaks in very different fashion of men whom, in spite of political differences, he regarded with cordial respect. But the good work it did, and the comparative moderation towards opponents with which it did it, availed nothing, when the Restoration came, to save the credit of the Cromwellian Visitation. The Visitors' Register, instead of being lodged in the University Archives, like all other records of University Commissions, found its way, through private hands, to the safe obscurity of the Bodleian, where, once stripped of all official character, it might be tolerated, side by side with Guy Fawkes's lantern, as a hateful

curiosity. Its sister volume, the Register of Convocation under the Visitors, was submitted to a solemn excommunication before it could be allowed a place among the University records. Without distinction of doers or of deeds ("singulis enim personarum piget"), "ista omnia prædicta censura subijcimus et damnamus." With such good round mouth-filling words did the King recover his own again in Oxford.

NEW SCHOOL BOOKS.*

MODERN France is a small volume treating of the history of France from the year 1814 to the year 1879. It passes in review all the numerous changes of government which the country has passed through since the restoration of the Bourbons on the abdication of Napoleon I. It is divided into five books, each book being again subdivided into chapters—a good arrangement, especially where so much matter has to be crowded into so small a space. Of these five books, two are devoted to "the Empire," that is to say, the administration of Napoleon III., which occupies a fourth part of the whole book. Mr. Browning's sympathies are wholly Republican, though he treats both Bourbons and Bonapartes with uniform fairness and toleration. Of the two Bourbons of the elder branch, he considers Louis XVIII. better than his brother, giving him credit for striving to do his best in steering between the different factions into which his kingdom was divided; in short, for having some sense of duty and the wish to do it, though his education and the prejudices of his race made his ideas as to the nature of that duty confused and false. Charles X., on the other hand, Mr. Browning considers as wholly given over to bigotry and pageantry; he "had no seriousness in himself and hated it in others." But, as Mr. Browning points out, the personal merits of the King had nothing to do with the duration of the restored monarchy. It had merely come in for a time during the lull that followed the storm. It was the reaction from the fierce excitement of the Revolution. Its fall was inevitable "as soon as the forces of progress were able once more to assert themselves." Of Louis Philippe Mr. Browning says in one page that he had good abilities, was affable and free from pride, and "admirably suited for the part of citizen-king," and on another that "he possessed some of the highest qualities of a sovereign. But he had no prestige among the people; he was unwise in the choice of Ministers; his throne was shaken by unforeseen disasters; and he was equally ill-timed in firmness and concessions." These two opinions strangely contradict one another. The faculty of choosing wise counsellors is certainly the first and most needful qualification for the kingly office, and the gift of knowing when to yield and when to maintain is only second to it; and it is difficult to conceive how any one could be in any degree fitted to wear a crown who was deficient in both these qualities. Mr. Browning's estimate of Napoleon III. is more happily expressed. Of him he writes:—

He attempted to use with prudence and wisdom the power which he had gained by a crime. He developed the material resources of France; but the necessity of preserving his dynasty forced him to invent excitement after excitement, by which the mind of the nation was diverted from the thought of its own condition. The war of 1870 proved that the currents of national strength had been dried up at their source.

Yet surely the wonderful rapidity with which France revived after that disastrous war proved that the sources of her strength still spring as freely as they have ever done. Would it not be more correct to ascribe her disasters to the currents having been fouled and choked by corruption and cowardice? Those who have heard residents in Paris describe the terrors of the Commune, and seen the destruction wrought on private and public property during its sway, will be astonished at the gentleness with which Mr. Browning speaks of its leaders—men who were so dead to all sense of patriotism, that they had no scruple in plunging their country, still held in the grasp of the invader, into all the horrors of civil war. Mr. Browning's little book contains a great deal of information, well arranged and clearly and concisely expressed. It is especially useful because a great deal of it is history which is still unwritten, a record of events which have happened so recently that most people have but a hazy impression of the sequence in which they followed one another, of the causes which led to them, or of the results which have come from them. In conclusion, Mr. Browning, reasoning from precedent, predicts a life of from fifteen to eighteen years for the Republic under which he considers that "the dream of the best spirits of the first Revolution seems to be fulfilled; after ninety years the best of the principles of 1789 seem to be realized." Let us hope that this was written before the recent attacks on the Jesuits and the religious orders showed so strange a departure on the part of the Republic from the true principles of freedom.

The volume of Collins's Historical Series treating of Holland and Belgium is a praiseworthy attempt to interest the buyers and

Benrose's Standard Grammar. By Thomas Newton. London and Derby: Benrose & Sons.

readers of such little histories in a country whose inhabitants are more akin to the English than any other European nation. Its author makes no pretence to original research or scientific treatment of his subject. His information has been drawn chiefly from Motley's several works. Out of these he has compiled a readable little book, embellished with woodcuts of the principal towns in the Netherlands. We note with pleasure the absence of those words printed in italics and capital letters with which it is the custom now to sprinkle such small histories—a practice supposed to be an assistance to the learner, but which certainly gives to the pages a most forbidding aspect.

The *Introductory History of England* is described on the title-page as a *précis* of Mr. Lupton's larger history. It is much more like an index, or rather table of contents, for an index has at least the advantage that it refers the reader to pages where fuller information may be found on subjects which it only names, while here the student is left to wander through a maze of names, and dates unguided, save where Mr. Lupton refers to his other book in an occasional foot-note. So entirely, indeed, is this the character of this little manual that it hardly deserves to be noticed as a separate book. As an introductory history, it is worse than useless; for, although the names of persons, places, battles, and such-like, jumbled up with disjointed notices of laws and statutes passed and repealed, of new customs coming in and old ones going out, may be an aid in refreshing a memory already stuffed with such incoherent knowledge, to a mind not yet introduced to English history they must be perfectly unintelligible. It is simply a cram book of the very worst sort, having no more resemblance to history than a handful of dust has to a human being. From its pages we get some notion of what Mr. Lupton's larger history is like. Its author boasts that he has therein embodied all that is required to pass with credit the most searching examination. Either the examiners must be very ignorant or very lenient to pass at all candidates primed with such knowledge as is to be found in Mr. Lupton's "Introductory History." It is, we are told, in the first place, "adapted for those who merely require to get up *Principal Facts*." Some of these principal facts are no facts at all—as, for instance, the statement that the renowned King Arthur is supposed to have reigned from 503–542 A.D., or that the first Prince of Wales was born at Carnarvon in 1284, or that William the Conqueror annexed the Channel Islands in 1066. We are surprised to find in Mr. Lupton's pages many of the old errors cropping up again that used to be rife in all the little manuals of English history some half-dozen years ago, but which have latterly disappeared before the influence of extended knowledge. Many of these errors no doubt arise from the obligation which the author has laid himself under of connecting a fixed date with everything that he mentions at all. Thus we have a given year assigned for the establishment of usages or the rise of states of society which were really the growth of centuries. What can be more untrue than the statement that in the year 457 A.D. "the invaders (of England) divided the country into seven parts, called the Heptarchy," or that the Witanagemot was instituted by Edmund in the year 940, or more awkward than to enter among the events of 1176 the amalgamation of the Saxon and Norman races? But everything in Mr. Lupton's world took place in this sudden and startling way. Not only did races abruptly amalgamate, they sprang into being with the same abruptness; for we find the year 1153 given as that of the "origin of the families Guelphs and Ghibelins." Among other new things Mr. Lupton tells us that a "regular succession of Prime Ministers commenced" in the reign of Henry VIII. It is a pity he has not added a complete list of them down to the present Premier. We should like to have seen with whom the list would begin. Unfortunately, too, Mr. Lupton may be found tripping in the most familiar historical facts. Thus he writes that Mary Stuart "married Sir James Bothwell." Who could suppose that the last of the Hepburns, the proud Earl of Bothwell, is the person thus introduced? But we have brought forward examples enough to show that Mr. Lupton is often confused and incorrect—two unpardonable faults in the author of a patent grammar, and his little book aspires to be nothing better. Our opinion of it is best given by slightly changing a well-known saying—for if its brevity be not a merit, it hath no other.

The greatest novelty about the *Teacher's English Grammar Assistant* is that it is written by a commander in the navy. He was inspired to undertake a work so far removed from the range of his profession by the difficulties he encountered when trying to teach grammar to a class in a pariah school. Forgetful of the old saying about the unskilful workman finding fault with his tools, he at once laid the blame of his want of success on the books in use; and finding all grammars, large and small, defective in some point or other, he set to work to write another. The *Teacher's English Grammar Assistant* is intended to supply the deficiencies and correct the errors of the legion of English grammars already in use. Commander Norman comments, with much justice and truth, on the looseness of the definitions to be found in these little manuals, such as the confounding nouns with things, verbs with ideas, and so on. His aim has been to write an elementary grammar "free from prevailing errors," and avoiding "loose, incorrect, and unsatisfying definitions and rules." To show that he has not always succeeded in coming up to this laudable aim we need only quote his own definition of verbs:—

"Every verb has a name, which always begins with the little word 'to.' 'Loved,' 'will love,' 'loving,' &c., are all parts of the verb 'to love.'"

Did Commander Norman, we should like to know, follow up this rule by requiring his pupils to write "to love," "to must," "to shall," &c. Again, his adherence to the old-fashioned division of verbs into regular and irregular instead of into weak and strong; and the treatment of the pronominal adjectives as pronouns instead of as adjectives, will prevent his book from being used by modern schoolmasters. Nor can we find in the pages of the *English Grammar Assistant* any striking merits sufficient to counterbalance these defects or to distinguish it from the crowd of contemporaries that it has been written avowedly to supersede.

Newton's Standard Grammar lays no claim to novelty of design. It is merely a reprint by a schoolmaster of the oral lessons by which he tried to awaken his pupils to a knowledge of elementary grammar, at all times a very difficult undertaking; but one in which Mr. Newton from his own account has found his efforts crowned with success. It is to assist workers in the same field that he has now published the lessons (there are sixty-six of them) which he has found so suitable to his purpose. They are simple and clear, and are accompanied by one hundred and sixty exercises for parsing and analysis which are, after all, the best means of teaching grammar thoroughly. Those lessons are intended to save other teachers the many weary hours of thought which they have cost their author—a charitable intention truly, but one the wisdom of which we are inclined to question; for a lesson is something like a sermon—unless it has been thought out by the speaker who utters it, it does not carry conviction with it. Grammar especially, of all subjects of study, can never be taught intelligently save by oral lessons, and these lessons cannot be of any value unless the teacher has thought out for himself the best means of expressing what he has to say.

AMONG THE HEATHER.*

THE sensation inspired by *Among the Heather* is something analogous to that once produced by a young lady who repeated to us all the compliments she had received during a ball, ending up each time with, "Now, what did he mean by that?" It was impossible to feel provoked or disgusted, or anything but intensely amused; and, in like manner, the excessive *naïveté* of Miss Hertford's novel and her confidence in the sympathy of the reader have something almost amusing about them, and prevent him from becoming as bored as might have been expected from the story.

The heroine of *Among the Heather*, Norah Grant, is an attractive young person enough; she is also one of those fortunate people who is able "to give a satisfied little nod" at her reflection in the looking-glass. We have always greatly desired to meet some of these ladies who are struck dumb with their own beauty when they encounter themselves in a pier-glass at a shop or in a ball-room. As far as we have been able to learn, most women experience an unpleasant shock at their full-length appearance, and feel towards their own images much as future generations may be supposed to do towards the life-sized portraits of their ancestors now living. Miss Grant, however, is not one of these; and perhaps she is justified in her confidence in her charms, as the two bachelors staying in this Highland lodge become victims to them. The younger of the gentlemen is Mr. Leicester, a perfectly impossible mixture of silliness, conceit, and devotion, who has fallen in love with Miss Grant the previous summer, and is only kept at bay by endless and rather broad snubbing. The other, Mr. Lindsey, is an artist, of the type with which fiction has rendered us familiar, who addresses his female parent as "Mother mine," and is apostrophized by her in turn as "My boy." It is he who is, of course, the favoured lover; and who, equally of course, refuses to understand the plainest signs, and persists in believing to the contrary. Such is the slender plot of the novel, and the method of its development is anything but impressive.

First, much space is taken up by the description of the ladies' costumes and the enumeration of the occasions when they looked suitably dressed, and when they did not. It is needless to say that the heroine, in spite of her poverty and modest amount of luggage, has always exactly the right thing to put on, while the harmless young woman who is pleasantly surprised at the civilization of the Highlands, suffers from the vanity of thin shoes and cambric gowns. Then Miss Hertford evidently thinks that Scotch manners and customs are as strange to the English of to-day as they were in the time of Dr. Johnson, and she describes them with equal minuteness, though not perhaps with equal vigour.

Presently he (the minister) entered, carrying his hat in his hand; gave out the psalm to be sung; and the precentor, stooping down, produced a large placard, whereon was inscribed the name of the tune. This he displayed in a conspicuous position to the congregation, and after a minute removed. Then touching his tuning-fork, he hummed the note, and stood up. Miss Tennant stood up too! Norah touched her, finding it difficult to command her gravity; for the Lodge pew was exactly opposite the pulpit, and consequently to the precentor also, and the concerned look on that gentleman's face as he discovered his rival in the gallery was truly comical to behold. Miss Tennant saw her mistake in a moment, and resumed her seat, covered with confusion. The precentor had now started the tune in an incredibly high key, and the congregation at the third or fourth word joined in, all at their own sweet will and individual taste. He led them safely up to a truly astonishing pitch; then, with a placid smile, meanly left them to make the downward journey by themselves; and so on through the psalm, varying the performance now and then with impromptu turns and shakes, wonderful to hear, but totally impossible to join in, they came at such unexpected moments.

* *Among the Heather: a Highland Story.* By A. C. Hertford. 2 vols. London: Tinsley Brothers.

As soon as the text was given out, the presenter found the place in his large Bible, evidently wishing to call attention to the close way in which he meant to follow the discourse; but at the same time he carefully placed the Bible to one side of him. He then produced from his pocket a clean folded handkerchief, a box of snuff, and a paper parcel. The handkerchief he opened and laid on the desk before him; from the box of snuff he profusely helped himself with a small bone spoon; from the paper parcel he took a large peppermint-drop, which he conveyed to his mouth under cover of the palm of his hand. Then, placing his head on the pocket-handkerchief, he remained in that position, immovable, during the rather lengthy sermon, to all appearance asleep, save for the cheerful crunching of peppermint he kept up all the time. Perhaps it was good for his soul; for he sang the final hymn with redoubled fervour, and, if possible, at a greater height than before. Then came the collection, when the whole congregation seemed to contribute the same sum of one penny. Miss Tennant had unfortunately forgotten her purse, and was going to let the box pass without contributing. She attempted this; but no, that patient little box at the end of the long stick remained stationary in front of her, seeming to say, "No, my friend, you have had your discourse, and must pay your penny!" Till Norah, taking pity on her, came to her rescue with a coin from her own purse; then, and not till then, did that importunate elder depart satisfied.

The events of this Sunday occupy many pages; every hour is accounted for, and the affection of Mr. Lindsay makes a distinct stride, for "coming in to enjoy a *dolce far niente* by the fire"—it sounds like a lozenge—he sees the sweet domestic picture of Norah in a low chair with a child asleep in her arms, and burns with desire to transplant her to his own hearth. In a few days, however, the harmony of the party is broken up by the arrival of an aunt and a lap-dog, and this furnishes the text for a dissertation on aunts in general, and the distinction between "unmarried ladies" and "old maids." We are far from denying that the distinction exists, only we could have dispensed with this lengthy exposition of it. But one of the most curious things about Miss Hertford is the air with which she announces the most ordinary facts to the world, as if they were the experiences of the discoverer of the North-West Passage. This old aunt, Miss Duff, is supposed to concentrate in herself the humour of the book by perpetually calling people "out of their names." Surely Lindsay is a much easier and more commonplace name to remember than "Lyndam" or "Linseed" or "Lindy," or any of the laborious appellations that she finds for this gentleman, and, being a Scotchwoman herself, she must have been accustomed to hear it from her birth. Miss Hertford, however, has her own views in the matter of names, and among them is her way of speaking of the gentlemen as "Geoffrey" and "Percival" and "Peter," though, as a rule, no one else calls them so. This the reader will find becomes irritating to the nerves; but it is part of a singular hallucination that we have before met with—that the employment of Christian names indicates a state of pastoral innocence, and promotes intimacy and affection.

Fifty-seven pages out of the two hundred and sixty-five in the first volume are devoted to the description of a picnic in which all the country side takes part. Who rode, who walked, who went in the waggone, who stayed at home, their reasons for doing all these things, and their reflections on them when done, are dwelt on relentlessly. Of course everything went wrong, and people got badly sorted. Everything always does go wrong at a picnic, which makes it the more wonderful how a person who has been to one can ever be sufficiently deluded to go to another. Still the patient reader does not despair, but places his hopes of an *éclatissement* on a dance which he finds is to take place a little further on. But even now the hero and heroine are not allowed to dance in peace. Minute as she always is, the prospect of a ball makes the authoress perfectly microscopic. Some pages are filled with disjointed reflections as to preparations for balls, the heartburnings that ensue, and the demoralization of the household the day after; but, when these reflections are disposed of, she comes carefully and conscientiously to the matter in hand. The reader will learn with astonishment that, for the first time within human knowledge, "the large old-fashioned fireplace was one mass of growing plants, flowers, ferns, and palms"; and that "a bed of soft green moss had been made on the mantelpiece, and into it was stuck the most beautiful of the out conservatory flowers." The ball-dresses of the ladies were on an equally novel and elegant scale; and Miss Grant, with an effrontery and originality that Madge Wildfire might have envied, wore on her head a wreath of bracken. Can Miss Hertford really be aware of the large and uncompromising nature of the fern in question? The ball shares the fate of the picnic, and we hail with delight a change of scene produced by a sudden summons of Norah home to London, though it is at the expense of accompanying her in every hour of her journey as religiously as if we were her familiar spirit. We also have the privilege of penetrating into the home of Mr. Geoffrey Lindsay and of his admirable mother; and high-bred collie. The bare mention of this last is sufficient to send off Miss Hertford into a long and confidential shapeless babble:—

"But I think any one who has ever possessed a loving faithful dog can understand the pleasure there is in talking to it. If you feel depressed, out of sorts, or worried about something, no need to explain particulars to the intelligent creature: the tone of your voice is enough; he feels for you at once and sympathizes to the best of his doggy abilities; or if you are in a particularly gay state of mind, how quickly the dear animal finds it out and enters into your joy, bounding round you, barking cheerfully to show that your happiness makes his! If all our clever fellow-creatures were as ready with their sympathy as are these dumb friends, how doubly our joys would be increased, and how lightened would our troubles be! If any one chances to read these lines who is not a dog-lover, I am sorry; but he could have missed the passage, had he so chosen, and I am only too thankful to be able to pay my small tribute of affection to many dear doggies, some of

whom have passed quietly away, and some of whom still live, adding much to the happiness of the homes of which they form some of the most respected members.

We might have expected from the amount of space allotted to his first appearance that this quadruped was to play an important part in the story, save the heroine's life, or unearth a lost will, or something useful of that sort, but he has no *raison d'être* at all, and shortly afterwards vanishes completely.

By this time our task is nearly done. Norah conveys her mother and sick sister to a farmhouse for change of air, and here the ornaments of the room are described with the elaboration of a Dutch picture, and we are made acquainted with two oil-paintings "representing a stiff, wooden lady, in a constrained position of a polished countenance, as if she had been cruelly exposed to the elements when a child, and a ditto ditto gentleman. Do not imagine," says the author, anxious to defend herself from a charge of satire, "that I wish to laugh unkindly at these pictures; I am only attempting to act art-critic, and point out the relative beauties of each," which follow at much length.

In this bower of beauty the long-deferred troth is at last plighted, to the immense relief of everybody concerned. For our part, even in real life, we have seldom been so weary of two lovers. Miss Hertford's tale, as shown by the extracts we have given, really needs little comment. It is gentle and refined, and the heroine herself is pleasant and natural; but this is all the praise that it is possible to give. There is an utter want of proportion and concentration about the whole thing, and only its amazing simplicity preserves it from becoming inconceivably tiresome. If, as we suspect, it is the work of a very young lady, she has much to learn before she can write a readable novel.

GERMAN LITERATURE.

THE interval between the overthrow of Prussia (1) by Napoleon and her resurrection after the Russian campaign is one of the most interesting, and not one of the least glorious, epochs of her history. Few countries have drained the bitter cup of national humiliation more nearly to the dregs, and it must be said that few have more thoroughly deserved the fate which they have brought upon themselves. But with the signature of the Treaty of Tilsit a new era opens, and the feebleness, duplicity, and incapacity which have characterized Prussian policy ever since the death of the great Frederick are exchanged, as if by magic, for a resolution of purpose and an administrative ability worthy of Frederick himself. The internal reorganization of Prussia has been fully described by the German and English biographers of Stein. Herr Paul Hassel's business is principally with her diplomatic endeavours to rehabilitate herself as a first-class European Power. His main purpose is to prove, what may easily be believed, that the rulers of Prussia never accepted the situation created for her by the then unprecedented overthrow of Jena. She would have aimed at her deliverance more openly, and effected it much sooner, but for the craft, rather than the absolute bad faith, with which Napoleon retained possession of the principal Prussian fortresses professedly as security for the contributions imposed upon the country. Notwithstanding this, Herr Hassel endeavours to show Prussian diplomacy was speedily on the alert, negotiating at St. Petersburg, London, Vienna, wherever there seemed a possibility of finding allies for a renewal of the contest. The Congress of Erfurt, however, by temporarily subjugating the Czar to French influence, compelled Prussia to adopt an attitude of extreme reserve. Stein was dismissed, Austria was left to fight her battle single-handed, and the attention of Prussian statesmen was mainly concentrated on those military and financial reforms which eventually aided them to resume the struggle for independence. Such is the general argument of Herr Hassel's history, which is not free from a marked political tendency. It rests, however, upon a mass of hitherto unused material, principally derived from the archives of Berlin, but supplemented by Austrian State papers and several important private collections, especially the correspondence of Count Götze, who was despatched on a secret mission to Vienna in 1808. The work is exceedingly well written, full of interest, and has no other drawback than the air of advocacy inevitable in a writer arguing in support of a preconceived conclusion.

Major Emil Knorr (2) appears to have had a special connexion with the Russian authorities at Warsaw, by whom he was entrusted with a mass of official material for the purpose of writing the history of the Polish insurrection of 1863-64. The German and French campaigns led to the interruption of his work, which would not, he says, have been resumed but for the recent regicidal attempts on the Continent. The plan of the book must have undergone some alteration, for it is no longer a history of the insurrection of 1863, but a survey of Polish revolutionary agitation in general from 1830 to 1865. Major Knorr seems to have a theory that the Poles are at the bottom of all the mischief that is done upon the Continent, and he has certainly produced sufficient evidence of the existence of a party among them antagonistic to other thrones beside the Czar's. It did not enter into his plan, and would indeed have been inconvenient, to inquire whose fault

(1) *Geschichte der Preussischen Politik, 1807 bis 1815*: Von Paul Has. el. Th. 1. Leipzig: Hirzel. London: Williams & Norgate.

(2) *Die Polnischen Aufstände seit 1830, in ihrem Zusammenhang mit dem internationalen Umsturzbestrebungen*. Von Emil Knorr. Berlin: Mittler's Sohn. London: Williams & Norgate.

this is, and who has turned an aristocratic, an unprogressive, and a somewhat bigotedly Catholic people into the horde of incendiaries he depicts it. The book is indifferently written, and by no means easy reading; but it is valuable from the numerous specimens it contains of Polish political literature, otherwise inaccessible, and significant of the attitude of the Poles, or a considerable fraction of them, towards Pan Slavism, Nihilism, and Western civilization. There is also an important appendix of documents relating to the last Polish insurrection, consisting both of the proclamations of the insurgents and of the counter-manifestoes and edicts of General Mouravieff. There are also memoirs on political and military subjects, proceeding from, or attributed to, Wielopolski, Herzen, Bem, Mieroslawski, and other remarkable personages. On the whole, the moral of Major Knorr's book would seem to be the assuredly undesigned one that, even from the point of view of its authors, the partition of Poland has not been found to pay.

An impartial parallel between Russia and England might be instructive. Under pretence of instituting such a parallel, Herr von Ugény (3) has raked together all the strictures upon weak points in English affairs, public and private, from the opium traffic to tipling ladies, with which English freedom of speech and love of grumbling liberally provide him. The Continental reader will naturally conclude that a voluntary confession must be true; and Herr von Ugény will not improbably convince him that English civilization is much on a par with Russian, unless he happens to know something about it for himself. While, however, Herr von Ugény's compilation is worthless, his remarks, from personal observation, on the frequent rudeness abroad of Englishmen who appear perfectly well bred at home are worthy of our countrymen's serious attention.

The International Monetary Congress in Paris has called forth, among others, two rather remarkable essays (4), advocating a double standard of metallic value, mainly on the ground that silver will otherwise be further depreciated and forced out of circulation, and that the stock of gold will be insufficient for the needs of the world. This view is advocated with great clearness and conciseness in Herr Jacobi's pamphlet. Professor Lexia's essay is more elaborate, and considers the question with especial reference to the diverse exigencies and probable action of the nations represented at the Conference.

Dr. Trumpp (5) possesses what is undoubtedly the first qualification for an historian of the religion of the Sikhs, a thorough knowledge of the subject. His disqualification is a curious lack of moral sympathy with the phenomenon which has nevertheless so powerfully excited his intellectual interest. This was conspicuous in the preface to his laborious translation of the *Adi Granth*, or sacred book of the Sikhs. No one, it might have been deemed, would address himself seriously to the translation of an enormous work in a difficult language, unless he were conscious of some kind of sympathy with its sentiment and spirit. Yet Dr. Trumpp's preface betrayed that the *Adi Granth* was to him mere foolishness. The circumstance is by no means complimentary to his critical faculty, implying a total incapacity to enter into the mystic and Pantheistic circle of ideas which has always proved most congenial to minds of the rarest quality. For the same reason, Dr. Trumpp's criticism on the Sikh religion is worthless, except in so far as it deals with matters of fact. His statement, for example, of the liability of Sikh monotheism to relapse into Hindu idolatry is, without doubt, perfectly trustworthy, and his generally sober and prosaic cast of mind renders him a dispassionate chronicler of the vicissitudes of Nanak's simple creed. In its origin it was but an offshoot from the monotheistic Pantheism of Kabir, and aimed, like the latter, at the comprehension of Hindu and Musulman in a wider religious unity. It owed its perpetuation and its diffusion to the military and administrative abilities of a line of warlike Gurus, whose developments would have amazed the man of peace from whom they derived their apostolic succession. The last Guru created the Khalsa, ultimately a Sikh Praetorian Guard, but originally as pure a specimen of a Church militant as the Knights Templars. After his death the Sikhs became a military republic, whose anarchy was rapidly hurrying it to dissolution when it fell under the sway of Runjeet Singh, after whom it again relapsed into the condition that rendered inevitable its destruction at the hands of the British. During this long period of turbulence and conquest, the pure precepts of the original Sikh creed had ceased to be regarded, and Dr. Trumpp is probably correct in ascribing very little influence to them at present. The *Adi Granth*, however, is still nominally held in the highest honour, and should a religious genius ever again arise among the Sikhs, may yet serve as the basis of a new crusade against Hindu idolatry and Hindu caste.

Herr Leopold Katscher has performed a useful work for German readers by abridging Mr. Huth's biography of Buckle (6). We did not, for our own part, find this work too long, and cannot agree with Herr Katscher that it is improved by the process of curtailment; but at the same time it is quite true that its length

is an impediment to its circulation among foreigners, and that the life of so perfect a type of the student and thinker as Buckle has a value for mankind wholly independent of the soundness of his theories. Herr Katscher has, therefore, done wisely in omitting Mr. Huth's exposition of Buckle's principles, and in confining himself principally to those anecdotes and letters which contribute most to convey a living portrait of the man. He has had the good taste to adhere, as nearly as possible, to the diction of the original, and by the help of a little rearrangement has produced a sketch of Buckle which will go far to make him a real man to the numerous German readers who have hitherto only known him as a book.

The revival of interest in Molière (7), of late years, is very remarkable. While his dramatic rivals, the tragic poets, who at one time passed as geniuses obviously more exalted in virtue of the more elevated class of composition essayed by them, have sunk to the position of representatives of a local and transitory form of the drama, Molière has taken definitive rank among the six or seven authors who have written for humanity at large, and whose art is, within its own department, consummate and absolutely infallible. Even so acute a critic as Lessing was far from regarding Molière justice, and indeed German criticism, as a whole, has to make him considerable amends. Herr Lotheissen has assuredly performed his part; the uniformity of his encomium might even be censured as monotonous, but there is no denying its justice. Molière did actually present a perfect model of dramatic art, uniting the elegance of Menander to the *vis comica* of Aristophanes, and Herr Lotheissen cannot be blamed for insisting on the very point which he has set himself to prove. At the same time, his panegyric would be in danger of becoming tedious were it not relieved by sketches of his author's times and circumstances, and of the personages with whom he was brought into contact, as well as investigations of the many obscure passages of his history. Perhaps the most valuable part of the work, however, is his examination of the changes introduced by Molière into comedy and his relation to his rivals and predecessors.

The most recent of Georg Ebers's reproductions of antique life (8) has been suggested by a little pictorial gem of Mr. Alma Tadema's, whose beauty, undoubtedly, may well afford inspiration to poet or novelist. Many visitors to the exhibition at the German Athenæum will remember the truly idyllic scene—the maiden's irresolute attitude and downcast gaze as she ponders the suit of her urgent wooer, a youth extended at her side on the marble bench upon which she is seated, with her back to the sunlit bay and the faintly flushed range of hills beyond the waters. This lovely background does not lend itself readily to the engraver's art, and the inadequacy of the rendering rather mars Herr Ebers's frontispiece. His own defect as a literary artist is of the contrary kind, not imperfection, but over-precision of detail. His personages seem actuated by his own laudable anxiety that his readers should be as well acquainted as himself with the minutiae of antique life. They are consequently continually insisting upon minor details which certainly assist the realization of the general picture by nineteenth-century readers, but which a Syracusan to whom they were perfectly familiar would have thought perfectly superfluous. The result is a want of keeping, occasionally aggravated by a direct oversight, as when the old woman, deaf while her hand-maids are talking about trifles, promptly recovers her hearing when the progress of the action requires her to understand what is said. Nor is even Herr Ebers's archaeology unimpeachable; his Syracusans of the third or fourth century B.C. keep cats and grow citrons. His story is, nevertheless, very pleasing in the main; simple, natural, and, if less severely Hellenic than Landor would have made it, an excellent specimen of that more romantic phase of classicism exemplified by such acknowledged masterpieces as Longue's "Daphnis and Chloë" and Goethe's "Alexis and Dora."

"Pencilings" (9) is a title happily chosen to express the slight yet graphic execution of Ferdinand Gross's miscellaneous tales and sketches. The writer has all the characteristics of a good *feuilletoniste*, and nothing but the comparative stiffness of the German language impedes his attainment of the French standard in this department of literature. Two short stories, each turning on unhappiness in marriage, are told with careless ease, yet with striking effect, and a remarkable insight into certain phases of feminine character. The writer evidently does not rate the fair sex very highly, and in an ingenious, though paradoxical, essay strives to prove that Shakespeare was of his opinion. Another minor sketch gives a very amusing account of an Italian drama supposed to be founded upon the life of Shakespeare; and papers on the stumbling-blocks of translators, Daudet, lyrical poems, and similar themes, display real critical ability, as well as a felicitous ease of handling.

The *Rundschau* (10) is less interesting than usual, the only contributions of any especial mark being the continuation of Gottfried Keller's "Sinnegedicht," and a series of letters from a Prussian officer at Berlin during the revolution of 1848. They indicate several points worthy of notice—such as the sympathy, even of liberal-minded Germans, for Austria against Italy; and the singular want of foresight with which, on the first receipt of the

news of the revolution in Paris, the probability of a sympathetic movement in Germany was overlooked in the apprehension of an immediate attack on the Rhine frontier. Herr Rodenberg gives an entertaining account of the manner in which the Flemish national spirit has asserted itself in politics, literature, and art; and the poetical myth of the submerged Atlantis and the scientific myth of the hypothetical Lemuria are exposed by a writer whose obligations to Mr. Wallace are probably greater than he has thought proper to acknowledge.

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

THE SATURDAY REVIEW

POLITICS, LITERATURE, SCIENCE, AND ART.

Price 6d.

CONTENTS OF No. 1,331, MAY 21, 1881:

The Second Reading of the Land Bill. Russia.
A Minister of Agriculture. The French in Tunis. Turkey and Greece.
Railway Servants and their Work. Co-operative Farming.
The *Servants de L'Etat*. Free Schools.

BOKIM, Esq., A.R.A., now in the Royal Academy (Central Hall, No. 1407), will be REPRODUCED in WEDGWOOD PATIENCE, of an entirely new body and colour, for subscribers only.—Prospectus, with Photograph and full particulars, sent upon application, to F. RATHBONE, 71 King's Road, Brighton.

LONDON LIBRARY, 12 St. James's Square.—The FORTIETH ANNUAL GENERAL MEETING of the Members will be held in the Reading-room on Monday, May 30, at Three o'clock in the afternoon.
By order of the Committee.

May 3, 1881.

ROBT. HARRISON, Secretary and Librarian.

ROYAL AGRICULTURAL COLLEGE, OIRENCESTER.
For the Science and Practice of Agriculture.

For intending Land Owners and Occupiers, Land Agents, Surveyors, Colonists, &c. The N.A.C. Farm, surrounding the College, is a mixed farm of about 500 Acres.
Chairman of Committee of Management.—The Right Hon. the Earl of DUCIE.
For Prospectus of College and Farm, List of Scholarships, Prizes, Diplomas, &c., apply to the PRINCIPAL.

OWENS COLLEGE, Manchester.—The COUNCIL, having decided to fund a new PROFESSORSHIP of APPLIED MATHEMATICS, invite applications from Gentlemen desirous of becoming Candidates. The fixed stipend is £350 per annum, in addition to two-thirds of the fees paid by Students.

The appointment will date from September 30 next. Further information respecting the duties of the Professor may be obtained from the PRINCIPAL of the College.
Applications and testimonials, addressed to the Council, will be received up to May 30.

J. HOLME NICHOLSON, Registrar.

BRIGHTON COLLEGE.—The office of PRINCIPAL will become VACANT at the end of the present Term. The Council are prepared to receive applications from Gentlemen desirous of the appointment.

Candidates must be Clergymen of the Church of England, in Priest's orders, of the degree of Master of Arts at least of one of the Universities of Oxford or Cambridge. Every information may be obtained of the SECRETARY, the College, Brighton, to whom testimonials must be sent on or before Thursday, June 9.

F. W. MADDEN, M.R.S., Secretary.

RADLEY COLLEGE SCHOLARSHIPS.—There will be an ELECTION to TWO SCHOLARSHIPS in June next: Several Scholarships, value £50, during stay at the School, and a Junior Scholarship, value £20, for four years, to which an Exhibition of £15 may be added.
Boys must have been under 14 on January 1, 1881. Examination begins June 15. For further particulars, apply to the WARDEN, Radley College, Abingdon.

SOMERSETSHIRE COLLEGE, BATH.—AN EXAMINATION will be held on July 13 and 14, to elect SEVEN ENTRANCE SCHOLARSHIPS.—Particulars may be obtained from the HEAD-MASTER.

ROSSALL SCHOOL.—ENTRANCE SCHOLARSHIPS.—Twelve to be competed for, June 25. Value from 70 Guineas (covering School Fees) to £50. Ages under 14 and 15. Candidates may be examined at Rossall or Oxford, as preferred, in Classics or Mathematics.—Apply to Rev. the HEAD-MASTER, Rossall School, Fleetwood.

ST. EDMUND'S COLLEGE, SALISBURY.—A HIGH-CLASS SCHOOL for BOYS of GENTLEMEN. The religious training is upon definite Church principles. Boys are Educated with much care and thoroughness. They receive individual teaching and help wherever needed. Candidates for Matriculation at the Universities are specially prepared. Terms, £75 a year.—For references, prospectus, or any further particulars, apply to the Warden, Rev. G. H. BOURNE, D.C.L.

TRINITY COLLEGE SCHOOL, STRATFORD-ON-AVON.—The Warden, RICHARD CURRY, M.A., is assisted by Seven Resident Graduate Masters, two being specially for Modern Languages. Special preparation for the Universities, Army, and all competitive Examinations. Exhibition to the Universities of £50 per annum. Junior Department for Young Boys. Large Playing Fields, Gymnasium, &c. &c. Terms, 50 and 60 Guineas.—Apply to the WARDEN.

S. ANDREW'S COLLEGE, CHARDSTOCK, Dorset. TERM began May 13.—Apply to the SECRETARY.

CARSHALTON HOUSE SCHOOL, Surrey.—BOYS carefully prepared for Civil and Military Examinations.

FOLKESTONE.—Mr. W. J. JEAFFRESON, M.A. Oxon., assisted by a Cambridge M.A. and competent Teachers, prepares PUPILS for the Universities, Woolwich, Sandhurst, and all Competitive Examinations. A few Vacancies.

UNIVERSITIES, ARMY, PUBLIC SCHOOLS.—A Derbyshire CLERGYMAN, M.A. Oxon., formerly Assistant Classical Master in the Charterhouse, and for several years a Past Tutor in Oxford, receives a few PUPILS for the above Examinations. Terms, for boys over Sixteen, £150; under Sixteen, £120.—Address, M.A., the Rectory, Marston Montgomery, Derby.

DAVOS.—Mr. J. W. LORD, M.A., Fellow of Trinity College, Cambridge, is desirous of taking a limited number of PUPILS to prepare for entrance at the Universities, Entrance Mathematical Scholarships, or other Examinations. The climate of Davos is particularly beneficial in cases where bracing and strengthening are needed before entering on hard work. Terms £150.—For further particulars, address Wadgate House, Walton, near Ipswich.

REV. R. H. QUICK, formerly Assistant-Master at Harrow, takes into his house BOYS who have not before been to a Boarding School, and who are intended for the Public Schools.—Address, Hill House, Guildford.

EDUCATION.—GERMANY, BONN—on-the-Rhine, 37 Baum-schuler Allee.—The Frikulein KUNDE receive a limited number of YOUNG LADIES. Home comforts, best masters, unexceptionable references.—For particulars apply to the above.

SWITZERLAND.—BOARDING SCHOOL for YOUNG LADIES, in a most beautiful and healthy situation. Best references. Terms, £50 per annum. A Young Lady would be received, at reduced fee, to give a few Lessons in English.—Apply to Miss. EMILIE, Chillon, près Montreux, Suisse; or to Mr. CURR, Esq., Aberdeen; T. MACINNES, Esq., 40 Westbourne Gardens, Kelvinhaile, Glasgow.

WIMBLEDON PARK ESTATE.—FREEHOLD BUILDING LAND for SALE, in large or small Plots, according to situation. Free Conveyances, Roads and Sewers made, 700 acres remaining to select from.—Apply to the Resident Agent, Mr. ALFRED W. DUNN, Surveyor, Wimbledon Park.

CONSOLS VERSUS GROUND RENTS.—Consols pay 3 per Cent. Freehold Ground Rents, equally safe, pay 4 to 4½, and constantly increase in value. Descriptive Paper gratis. Sixty Lots for Sale.—Messrs. URSER, 90 London Wall.

HOTELS.

BRIGHTON.—BEDFORD HOTEL.—Facing Sea and Esplanade. Near the West Pier. Central and quiet. Long established. Suites of Rooms. Spacious Coffee-room for Ladies and Gentlemen. Sea-Water Service in the Hotel.
BENJN. BULL, Manager.

THE HERACOMBE HOTEL is on the verge of the Atlantic, in its own Ornamental Grounds of Five Acres. It contains 250 Rooms and is "a model of sanitary excellence." One of the largest Swimming Baths in England is attached to the Hotel and is now Open for the Season. Cheap Tourist Tickets to Heracombe for Two Months from all principal Railway Stations.—Tariff and every information of MANAGER.

RODRIGUES' NOVELTIES in MONOGRAMS, ARMS, Crests, and Addresses. Steel Dies Engraved on Gems.

NOTE PAPER and ENVELOPES artistically illuminated in Gold, Silver, Bronze, and Colours, in the first style.

THE GREAT WESTERN STEAMSHIP COMPANY, Limited.

Incorporated under the Companies' Acts, 1862 to 1880, whereby the Liability of a Shareholder is limited to the amount of his Shares.

CAPITAL, £1,000,000, DIVIDED INTO 20,000 SHARES OF £50 EACH.

Of which 8,000 Shares will bear a Preferential Dividend of Six per cent per annum, payable out of profits from year to year, and the remaining 12,000 will be ordinary shares, of which 4,000, or thereabouts, will be allotted to the present owners of the steamships belonging to the Great Western Line.

There are now offered 4,000 Preference and 4,000 Ordinary Shares, payable as follows, namely:—£5 on application, £5 on allotment, and the balance from time to time as required. It is not anticipated that more than £80 per share will be called up on the Ordinary Shares, but to meet the wishes of some investors the full amount will be received upon a limited number.

Directors.

MARK WHITWILL, J.P. (Mark Whitwill & Son), Bristol, Chairman and Managing Director.

Brokers.

THE MEMBERS OF THE BRISTOL STOCK EXCHANGE.

ABRIDGED PROSPECTUS.

This Company has been formed for the purpose of acquiring, working, and extending the Great Western Line of Steamships, which for some years have traded between Bristol and New York, and for the general purposes of a Shipowning Company.

The Line was started by Messrs. MARK WHITWILL & SON, in the year 1871, and it now consists of Six Steamships—namely, the *Arragon*, *Cornwall*, *Somerset*, *Devon*, *Bristol*, and *Gloucester*, engaged in the foreign trade, and one, the *Redland*, engaged in the coasting trade, for the purpose of collecting and distributing cargo in connexion with the foreign-going vessels.

These vessels have hitherto been owned by various persons, but entirely managed by Messrs. MARK WHITWILL & SON, who have been largely interested in them. Other steamships have from time to time been chartered for the purpose of developing trade with Montreal, Baltimore, and Boston. Complete arrangements have been made with the Railway Companies for through traffic between the chief centres in America and Bristol, via New York and the above-named ports. The trade is believed to be capable of great extension, especially as the Docks at the mouth of the River Avon provide accommodation accessible at all tides for large Ocean Steamers, and are in direct communication with the Midland Counties, West of England, South Wales, and London.

The Passenger traffic also, of which Messrs. WHITWILL have for thirty years had some share, should largely increase with increased facilities, as Bristol is the most central port in England, and while easy of access from all parts of the country, is within less than three hours' distance from London.

The development of trade between Bristol and ports in the United States and Canada during the last few years may be illustrated by the following statement of the tonnage of vessels entering Bristol from some of these ports with grain and provisions; namely:—

	1870.	1878.	1880.
New York ..	Steam .. 3,314 .. 57,597 .. 91,697	Sail .. 28,320 .. 45,156 .. 88,645	
Montreal ..	Steam .. 3,083 .. 2,842 .. 21,617	Sail .. 305 .. 8,282 .. 11,584	
Baltimore ..	Steam .. 305 .. 8,282 .. 11,584	Sail	
	85,052	116,774	188,978

Arrangements have been made for acquiring the seven vessels before mentioned, and the business connected therewith, upon terms which are believed to be fair and reasonable. The price to be paid is £200,000, which (except fractional parts) is to be accepted in shares of the Company, credited as fully paid, and the Company will adopt all agreements and engagements entered into by Messrs. WHITWILL & SON, in respect of each of the vessels as from the completion of the last voyage commenced by her before March 31, 1881.

The price of each vessel has been fixed with reference to her original cost, the result of her past trading, and her present age and condition. The aggregate amount, £200,000, although beyond the price which would be realized by a forced sale, is believed to represent the fair value of the vessels, and the business is a going concern. It is far less than the original cost, and includes considerable reserve funds, which are available for repairs. No promotion money will be paid.

The amount of Dividend distributed amongst the Owners (after payment of insurance and provision for the reserve fund above alluded to) during the period for which the steamers have been running has, upon an average, exceeded 10 per centum per annum upon the purchase-money now payable. It is anticipated that at least as good a result will be obtained in the future.

It is proposed, by means of the new capital, to acquire other suitable boats, so that the Company may eventually meet the requirements of the trade without chartering the vessels of other owners.

The Preference Shares will be ultimately fully called up. It is not anticipated that more than £30 per Share will be called upon the Ordinary Shares, but to meet the wishes of investors the Directors will receive full payment (which will rank for Dividend) upon a limited number of such Shares. Any parties desiring to avail themselves of this option must intimate such desire when making their application for Shares.

Prospectuses and Forms of Application for Shares may be obtained from the Company's Secretary, Solicitors, or Bankers.

Copies of the Memorandum and Articles of Association of the Company, and of the Contract above mentioned, may be inspected at the Office of the Company's Solicitors.

THE PORTE AND THE POWERS.

THE signature of the Convention by which Turkey undertakes to hand over the greater portion of Thessaly to Greece in a period of six months, on terms approved by the Powers, will, it may be hoped, have settled for some time a question very embarrassing to all who had to deal with it. The Greek Government has hitherto successfully resisted the cry of indignation which the terms of the new arrangement naturally excited in a people who are new to political life, have an exaggerated opinion of their own power, and who were carried away by the false hopes held out to them by the Berlin Conference. Fortunately the Greeks are not destitute of common sense, and they have the advantage of being governed by a KING who is in close communication with the heads of other Courts, and knows what it is possible and what it is not possible for his friends to do for him. If the Berlin Conference had not promised more, Greece would now have seemed to have got very much. She is no longer told that she is a young nation and can wait. She has got all of Thessaly that is worth having, she has got a strong position given her in Volo, and she has got the Gulf of Arta neutralized. What she has not got is the privilege of fighting with the Albanians for a corner of Epirus. On the whole, she may be said to have got as much as it is in her real interest to get; and she has got it by the strenuous exertions of the Powers, and especially of England, on her behalf. The European Concert has proved to be a curious piece of machinery. Sometimes it has played its tune loudly, sometimes very faintly. Sometimes it has seemed to cease playing altogether. But in the end it has produced definite and valuable results. It has settled, at least for the moment, the very troublesome Duloigno and Greek questions. But, although the European Concert has ostensibly done this, it is evident that it has only done this because there has been a concert within a concert. Germany and England have really settled the Greek question. They came to an agreement, and the other Powers looked on with mild complacency while the agreement of Germany and England was forced on the Porte. France was frightened by Germany into standing out of the way. It dropped the Greek question as far too burning when Prince BISMARCK pointed out how very hot it was. With England Prince BISMARCK readily consented to deal. He talked over with Mr. GOSCHEN what amount of pressure should be put on the Porte, and the Porte found that it had no one to support it when it attempted to resist what England and Germany agreed in supporting. That the two Powers which worked towards a result on which they had previously agreed should have also worked in the name and with the concurrence of the other Powers was no doubt advantageous. It prevented jealousy, and cut away the ground from any future remonstrance. It was perhaps comforting to the SULTAN and imposing to the Greeks that when they bowed they were told they were bowing to the will of Europe. But it is no use to try to disguise what has really happened. The European Concert is a scheme of management by which the Powers settle which of them in turn shall do something to the Porte, and what it shall be.

The creation of the Tunis Protectorate is the last something that has been done to the Porte, and it has been done by France with the sanction of the European Con-

cert. All the Powers, except France, allowed that Tunis was part of the Turkish Empire, and the Porte appealed to those who recognized its rights not to allow these rights to be swept away by military force. The answer given by Lord GRANVILLE was the answer given by the representatives of all those to whom the appeal was made. The European Concert was not to be broken up for such a trifle as Tunis. France denied the claims of the Porte, and the best advice Lord GRANVILLE could give the SULTAN was to recommend the BEY to co-operate with the French against the Kroumirs, and thus to localize the dispute and avoid any question as to the sovereignty of the Porte arising. But Mr. GOSCHEN, in acting on the instructions of Lord GRANVILLE, was exceedingly cautious. The SULTAN tried to get him to say that England advised the Porte to order the BEY to co-operate. But Mr. GOSCHEN would say nothing of the kind. To allow that the SULTAN could order the BEY was to allow that he was the BEY's superior, which is precisely what England did allow throughout the discussion. But this would have been to formally contest the assertion of France that the SULTAN had nothing to do with Tunis except as a religious chief. To escape from taking up any position that could be considered as in any way hostile to France was the aim of all the parties to the European Concert. As Lord GRANVILLE frankly told the Porte, the Powers were not going to range themselves on different sides in regard to Tunis. They all shrank from a new Eastern question, and listened in silence, if not with approval, to the declaration of France that, if the Porte sent men or ships to Tunis, France would drive them back. The PRIME MINISTER of the SULTAN subsequently made an appeal to Mr. GOSCHEN in the name of the old friendship of England and Turkey. Mr. GOSCHEN replied that Turkey had long systematically rejected the advice of England and thwarted her in every possible way. SAID PASHA admitted this, but promised that in future Turkey would behave very differently. Mr. GOSCHEN has been long enough at Constantinople to place proper value on promises of this kind. But, even if he had believed what was said to him, he could have done nothing to earn the gratitude of the Turks. The Powers no longer ask themselves how the Turks ought to be treated, but how they themselves will be affected if the Turks are treated in any particular way. England has satisfied herself that, so long as British subjects are adequately protected in Tunis, it is a matter of indifference to her whether the BEY is a puppet in the hands of France or a puppet in the hands of the SULTAN. For the sake of the European Concert it was clearly desirable that he should accept the former character, and so he now dances to the tune of Paris and not to that of Constantinople, and Europe is happy and at peace.

But it must not be supposed that the machinery of the European Concert is worked in the easy and simple way of one diplomatist telling his colleagues what he thinks of doing, asking whether any one has any objection, and then going and doing it after he has received a kindly smile of assent. What would be the good of diplomatists if no more diplomacy than this were needed? A diplomatist who wants to gain his end must exercise a certain amount of judicious cunning; must shift his ground, give assurances, meet objections, invent delicacies of language, and, if he is a diplomatist of the good old school, use freely the great art

of deception. M. ST.-HILAIRE is a thorough diplomatist of the old school. There was no art of his craft to which he did not have resort. He tried modesty; he tried bluster; he tried, and freely tried, what, to be polite, may be termed departing from accuracy of statement. His modesty and his inaccuracy did, to a certain extent, succeed with Lord GRANVILLE. For a time Lord GRANVILLE could not help accepting M. ST.-HILAIRE's positive assurances that nothing more was meant than the punishment of the Kroumirs. But when M. ST.-HILAIRE said that he had no notion how many French ships were in Tunisian waters, Lord GRANVILLE allowed it to be seen that he thought this very odd; and when M. ST.-HILAIRE stated that a large force of French troops had been landed at Biserta merely to take the Kroumirs in the rear, Lord GRANVILLE could not help wondering why any one should think it worth while to tell such a barefaced departure from strict accuracy. Of one of his diplomatic achievements M. ST.-HILAIRE was extremely proud. He pointed out with triumph to Lord GRANVILLE that he had announced to the Porte that, if Turkish ships were sent to Tunis, France would treat it, not as a *casus belli*—that would have been a rude and gross term for such an accomplished diplomatist—but a “cause of conflict.” Such is the honeyed language of diplomacy, and only great artists like M. ST.-HILAIRE know how to use it. Diplomacy must be of great use if a threat to blow up the ships of another nation can be made pleasant by calling a *casus belli* a cause of conflict. When, instead of modesty and departures from accuracy, M. ST.-HILAIRE tried bluster with Lord GRANVILLE, he did not succeed at all. During the discussion of the Enfida affair M. ST.-HILAIRE suddenly said that he had ordered a French man-of-war to go at once to Tunis and uphold the interests of the French claimant. Lord GRANVILLE at once ordered an English man-of-war to go to Tunis and prevent injustice being done to the English claimant. When M. ST.-HILAIRE learnt that an English ship had really been sent without any notice having been given him, he at once said that a dreadful mistake had been made; that the French ship had been sent, not at all in connexion with the Enfida affair, but to baffle some mysterious project of Turkey, and he was quite ready to agree that both the French and the English ships should go away, and the dispute be left to the tribunals. So, too, when the mask was at last thrown off, and the treaty creating a protectorate had been signed, Lord GRANVILLE was firm, and successfully firm, in insisting on having it recorded that all privileges given to British subjects in Tunis by the BEY should remain in force, and that France had no power to abridge them, except by a new treaty to which England should be a consenting party. The despatches of Lord GRANVILLE are in every way satisfactory when once it is admitted that he was right in avoiding a quarrel and in leaving Turkey unsupported. He was always firm and always courteous; and through his firmness and his courtesy there pierces a delicate and polished contempt for the tricks and subterfuges of the diplomatist of the old school, who was plotting and evading in the style recognized as masterly in the days of Louis PHILIPPE.

THE PRESTON ELECTION.

THE result of the Preston election is sufficiently remarkable to justify inquiry into its probable causes. The divergence of political opinion among constituencies which seem to be socially and economically similar is not a little puzzling. In Lancashire, Preston, Wigan, and Liverpool have for some time past inclined to Conservatism, while other large towns in the same county elect Liberal members by decisive majorities. The triumphant return of Mr. ECKROYD requires further explanation. At the general election Sir JOHN HOLKER defeated one of the Liberal candidates by less than 300 votes. The Conservative majority on the present occasion exceeds 1,600. The Irish voters in the borough probably followed the advice of their leaders by supporting Mr. YATES THOMPSON, and perhaps, as on some other occasions, their alliance may have deprived the Liberal party of more votes than it added. Mr. THOMPSON, a candidate of estimable character and of considerable ability, has some official experience, and in his earlier days he received the compliment of being invited to contest one of the county divisions as

colleague of Mr. GLADSTONE. Mr. ECKROYD, a manufacturer, now or formerly belonging to the Society of Friends, was also a creditable representative of his party; but he was only the subject of a second choice; and there is no reason to suppose that his personal claims excited any extraordinary feeling of enthusiasm. It is possible that his success indicates a current of Conservative reaction; but there have been hitherto no certain signs of such a tendency in the country at large. There is probably some special reason for the decision of the Preston electors; and the only peculiarity in Mr. ECKROYD's political creed is that he is an advocate of that form of protectionism which is known as Reciprocity. The depression of industrial enterprise is probably felt at Preston as well as in other manufacturing districts; and it is not surprising that the suggestion of any kind of remedy should be accepted with favour. The imposition of high duties on foreign produce would in any case be capricious and partial, because it would be obviously impossible to exclude or discourage the importation of food or of the raw material of industry. The competition in the home market of imported manufactures is only in a few cases felt as a practical evil. The real grievance to English producers is that they are, through a vicious commercial policy, either excluded from European and American markets or hampered in their dealings with excessive duties. The temptation to retaliate is perfectly intelligible, for experience shows that consumers are often ready to sacrifice their own interests by consenting to an artificial dearth. The system of commercial treaties has necessarily tended to confirm the delusion that the duties are more profitable to the foreign producer than to the domestic consumer. Mr. ECKROYD was not himself misled by the fallacies which he nevertheless encouraged during the negotiation of the French Treaty. The supporters of reciprocity generally profess to approve the principles of Free-trade, under the impossible condition that it should be equal and universal. In the meantime, they propose to wage a war of tariffs which would, amongst other inconveniences, confirm the prejudices of their foreign competitors. It is not improbable that Mr. ECKROYD owes a part of his local popularity to his concurrence in the fallacious theory of reciprocity. It may be hoped that the Conservative party will not identify itself with a document which is fundamentally erroneous. Sir STAFFORD NORTHCOTE has on more than one occasion forcibly exposed this fallacy, to which some of his political allies are too much inclined. Lord BEACONSFIELD, in one of his latest speeches, though he had, perhaps, not thoroughly emancipated himself from the influence of a false economic theory, warned his party against the blunder of pledging itself to a policy which he recognized as impracticable. The caution may, perhaps, have been rendered more necessary by the Preston election.

The heresies of reactionary politicians are partially excused, though they cannot be justified, by the intolerant dogmatism of complacent Liberals. Mr. BRIGHT and many orators of inferior rank have for a generation or two incessantly taunted their adversaries with the assumed failure of predictions which have nevertheless been tardily but indisputably fulfilled. In the days of the Corn-Law League landowners and farmers loudly proclaimed their apprehension that the withdrawal of Protection would result in the ruin of English agriculture. In many instances their fears pointed in the wrong direction, as when the fabulous fertility of the Russian province of Tamboff was supposed to render domestic competition hopeless. On the other hand, it seemed evident that Free-trade in corn would be useless if it produced no reduction of price. Mr. CORBEN's persuasive ingenuity failed to satisfy producers that they would profit by the increased cheapness of the commodity in which they dealt. When an agitation for the establishment of sound principles prevailed by preponderance of numbers rather than by strength of argument, the most sanguine anticipations seemed to be justified by the result. The years which followed were, even for farmers, among the most prosperous on record. The price of corn was not extraordinarily low; the consumption of butchers' meat was enormously increased; and the monopoly of live stock was but imperceptibly disturbed by importations from neighbouring Continental ports. In those days the Chicago corn elevators existed only on a comparatively small scale; and the possibility of conveying live cattle across the Atlantic by steam had only been imagined by a

few speculative professors. The revolution in agriculture which seemed to have been unaccountably averted has, after five-and-forty years, suddenly, and perhaps irrevocably, occurred. The process of ruin has been accelerated by two or three cold and rainy summers; but in former times the rise of prices after a bad harvest in some degree compensated farmers for the deficiency of their crops. The failure of the harvest at home is now abundantly supplied from abroad, to the great advantage of the general community, but with the result of rendering the condition of the domestic producer hopeless. Many hundreds of farms are consequently thrown on the hands of the owners, while the former occupiers seek other modes of subsistence; and the Liberal economists and politicians who chuckle over the misfortunes of the landlords can scarcely regard with satisfaction the relapse of large tracts of land into the condition of a desert. The popular clamour for increased application of capital to the land becomes absurd when neither landlord nor tenant can cultivate at a profit. The widespread distress which has fallen on the land is the result of natural laws. The cost of retaining the Corn-laws would have been still greater; but, if the land were at this moment divided among two or three millions of freeholders, a demand for Protection would be raised which it might be difficult to resist. Monopoly, however unjust, is comparatively secure when it rests on a broad basis of interested support.

The political prophets of evil who denounced the dangers of the earliest democratic innovation may, if any of them survive, boast with equal truth of the fulfilment of their predictions. One of their errors consisted in their imperfect comprehension of the necessity and of the utility of the changes which they deprecated; and, like many other oracular alarmists, they miscalculated the date at which their terrors were to be realized. The Reform Bill of 1832 was, on the whole, just and expedient; and its advantages were illustrated by a long period of beneficent legislation. The opponents of the measure had, perhaps, become convinced of the mistake which they had committed, when, through the vanity and ambition of rival party leaders, the agitation for further extension of the franchise was prematurely revived. Household suffrage in boroughs was followed by the introduction of the practice of secret voting which had been with difficulty staved off at the time of the first Reform Bill. The present Parliament will complete the transfer of all electoral power into the hands of the class which lives on weekly wages; and almost every kind of property is simultaneously menaced with attack. Demagogues loudly threaten the application to Great Britain of a legislation which is professedly required by the exceptional circumstances of Ireland; and it is universally felt that revolutionary doctrines have made a greater advance within one or two years than in the long interval which separated the Reform Bill from the last general election. Day by day more and more supporters of the party of movement drop off, and decline to share any further in the downward progress; but the natural protectors of property, of order, and of liberty, have lost the greater part of their former influence. They will destroy any chance which may remain of recovering a portion of political power if they ally themselves with the professors of false economical doctrines. The Opposition will have been injured by the Preston majority if it is misled into complicity with Protection or fiscal retaliation.

THE IRISH LAND BILL.

THE salutary custom which interposes—at least in the earlier days of the Session—some little interval between the second reading of an important measure and the time of going into Committee can seldom have been more salutary than in the case of the Irish Land Bill. That, under the circumstances, it would be a grave responsibility for any party to throw out that Bill, unless they are prepared to govern Ireland by the strong hand and to meet its demands in a different but equally sweeping fashion, has been sufficiently contended already. That, under the same circumstances, the grave objections which serious politicians not prepared to sacrifice economical and social principles must feel to the Bill were justly vindicated by the taking of a division on the second reading has been also sufficiently made clear. It is important,

however, to distinguish between the real and the factitious significance of a division, however one-sided, on the second reading. There are persons who, when it suits them, assume that such a division settles the matter. The House has spoken; the cause is finished. Those who happen to be somewhat less lightly equipped with historical and constitutional knowledge than is the wont of some public instructors nowadays know that nothing can be further from the truth. The significance of a majority, large or small, on the second reading of a great Government Bill is simply this; first, that the House of Commons does not immediately desire a change of Ministry; secondly, that it thinks that the measure before it may, with more or less alteration, be possibly made a good Bill. No House of Commons is further plodged than this by the most overwhelming division at this particular juncture; and the arguments by which Mr. GLADSTONE and other Government speakers strove to make it appear that the Opposition were doing something unheard of in supporting an amendment will bear the test of history as little as the test of common sense.

The field therefore remains open for criticism, but it remains open in a somewhat different direction. Events may still occur which might make it the duty of the Opposition to propose the rejection of the Bill on the third reading, or which might throw on the House of Lords the graver responsibility of appealing to the constituencies, but that is not yet. For weeks, probably for many weeks, it will be the duty of hostile critics of the measure to do their utmost to reduce it to such form as may possibly do good while not certainly doing counterbalancing harm. In so huge a Bill, it may seem difficult to single out those parts which may be characterized as dubiously just and wise experiments, and those which must be described as absolutely unjust or certain of failure. Yet, with a certain latitude of discrimination, the thing can be done. The schemes, vague and ill-defined it is true, for the creation of a peasant proprietary, for the improvement of waste lands, for the encouragement of emigration, and the like, may be assented to, if properly guarded, without much misgiving. They will probably fail, because they are what is commonly, if absurdly, called an attempt to play Providence. But they might succeed by accident; it would be a good thing if they did succeed; and if their success is in any way possible, it could be obtained without any necessary injustice or confiscation. So also it is possible, though the means would have to be very carefully considered, that a scheme for arranging with landlords for the giving up of their lands at a fair price, should they dislike the servitudes which the Bill imposes on them, might be framed. In the case especially of purchasers under the Encumbered Estates Acts, and those who have expended money in buying up rights conferred by the Act of 1870, something of the sort seems absolutely necessary. But when we come to the three F's, it is manifest that the battle begins. It is imperative that the Opposition should use every means in its power to prevent the gross injustice of valuing the competition value on the tenants' instead of on the landlords' side, and the still grosser injustice of the resurrection of bought-up tenant-right. Mr. KAVANAGH, an excellent authority but not a professional lawyer, doubts whether this last is definitely contemplated by the Bill. It is significant that the ablest lawyers to be found in Ireland think it is, and that the specially retained champions of the Government do not assert definitely that it is not. That a tenant should be established in his holding at a fair competition rent for an arbitrary term of years at his landlord's peril if he, paying duly and breaking no covenant, is turned out, is an unnecessary and intrinsically absurd violation of certain very obvious principles, but it is not in itself a thing to make a revolution about. It amounts in effect to a clumsy legislative enactment of the Scotch system of long leases; and if the Government see the salvation of Ireland in it, they must, after the expression of the opinion of the present House of Commons, be left to their probably foolish dreams. But as the presentation to a fortuitous tenant who happens to be in occupation in this year of grace of a tenant-right not merely growing out of, but forming part of, his landlord's property, is demonstrably unjust, destructive of confidence, and fatal to the prosperity of Ireland, that will most assuredly have to be opposed. The other points on which the Government will, if they are wise, accept correction of their form-

less bantling are numerous, but of minor importance, and require a certain digestion of the amendments moved, or to be moved, before they can be properly appreciated. The number of these amendments is already vast, and although its vastness is to a certain extent delusive, the utmost sifting will still leave a formidable array. On all important Bills notice is given of numerous amendments which overlap or include each other, or which are afterwards abandoned by their proposers without division or debate. But in this case it need not be doubted that the residue will be formidable enough. The proportion of these to be moved by supporters of the Government is considerable, and may account for the conciliatory tone which Mr. GLADSTONE adopted. This tone contrasted remarkably with that of the Irish ATTORNEY-GENERAL, who has indeed been uniformly unfortunate in his speeches on this subject. The doctrine that the assumed iniquity of a possession bars the possessor's right to compensation will hardly be accepted.

The digression which the Irish members have made during the present week in reference to the working of the Coercion measures has, practically, not much to do with the Land Bill. Mr. FORSTER is in reality face to face with a problem quite different from that with which Mr. GLADSTONE imagines himself to be dealing. The rejection of the Land Bill might—indeed, it undoubtedly would—serve as the pretext for an aggravation of the hardly masked rebellion which exists in some parts of Ireland; its acceptance would assuredly not put an end to that rebellion. The defence which Mr. FORSTER made on Tuesday against his Irish assailants was conclusive enough; the defence which he did not make against another and a very different class of assailants would have been but feeble. His fault is that he has nibbled at the evil weeds which have choked Irish politics instead of sweeping them down with a single blow of the scythe with which he was furnished by the Coercion Acts. Leader after leader has been arrested, but the arrests have been piecemeal, dilatory, hesitating, giving time for recruits to step into the vacant place, and encouraging a belief in the minds of the disaffected that the Government is afraid to hit out boldly and decisively for fear of its Radical allies. It is hardly too much to say that every man now in gaol under the Act might have been in gaol within twenty-four hours after it came into effect. Such a sweep of the net would have struck terror into the evil-meaning and have refreshed and heartened the good. The Government have chosen to pursue a wholly different plan. They have, as has just been said, nibbled at the conspiracy; they have struck at it and then run away, after the fashion of small children who, though animated by a certain pugnacity, are afraid to close with their antagonists. Therefore it flourishes. The doctrine of a general strike against rent has been promulgated by Land League fire-eaters, received with no great disapproval by their clerical allies, heard with demonstrative shakings of the head by Radical players on the strings of popular gullibility in England. First the cry was "No evictions," then "No rack rents," then "Griffith's Valuation," then what the tenant could afford to give, then a strike against rent as rent. The fact of this last development must be before the House of Commons as it studies the Land Bill in Committee; and it ought to influence their conclusions, not necessarily in the way of an absolute rejection or vital mutilation of the measure, but certainly so as to prevent them from entertaining the idle and absurd notion that a slice of the landlord's property, hastily awarded, will stay the stomach of Irish hunger for that which is not the hangover's.

JEWS IN RUSSIA.

IT is strange that a persecution of the Jews at the present day should recall mediæval precedents which had long been deemed obsolete. In France, or in Paris, for there are still prejudices in remote districts, the Jews have enjoyed freedom and equality since the Revolution, and in later times they have had their fair share of office and distinction. One of their number was a member of the Republican Governments of 1848 and 1870, and another was one of the most considerable Ministers of the Second Empire. The removal of the disabilities to which they were subject in England was effected at a later period; and it is even now not theoretically complete. The possible creation of a Jewish peer would, for the first time, raise

the question whether he would be allowed to sit in the House of Lords. In the meantime many Jews have been elected to the House of Commons, though it is almost impossible for a Roman Catholic to find a seat for any constituency in Great Britain. The religious prejudice against an unpopular Christian sect has oddly survived the distaste with which the admission of non-Christians to Parliament was once regarded by almost all classes. The profession of the Jewish faith is no disqualification for success in liberal professions; and one of the ablest and highest in rank among the judges belongs to the Jewish community. The sudden agitation against the Jews in Germany and Russia has caused natural surprise. The most active promoter of the German movement is one of the EMPEROR's chaplains; and it is suspected that the CHANCELLOR himself regards the persecution with a certain favour. As orthodox enthusiasm is rare among German Protestants, it may be assumed that dislike to the Jews is founded on social or commercial grounds rather than on religious fanaticism. One of the pretexts for popular clamour is the large share which Jewish writers are supposed to take in the conduct of newspapers, some of which represent ultra-Liberal opinions. The prosperity of the Jews as dealers in money, both on a large and on a small scale, is probably a mere operative cause of popular dislike. If it were necessary to speculate on the tendencies of a separate national descent and a peculiar religion, it might seem probable that an isolated minority would be wanting in patriotic feeling; but in practice it has been found that Jews, when they are treated as equals by their neighbours, share all their sympathies, and even their prejudices. No German seriously believes that his countrymen of Jewish extraction are especially prone to the cosmopolitan form of disloyalty.

The genius of the Jews for finance has in many countries exposed them to popular antipathy. COBBETT, who impersonated all the rustic prejudices which flourished in his time, classed them with Quakers as burdens on the community, because they were seldom known to engage in manual labour. His dislike went so far that he complained of a shock to his religious sentiments through the profane utterances in the synagogues which he professed to have heard as he walked about the streets on Saturdays. A simple-minded deputy to the Constituent Assembly of 1848 had received from his electors the solitary mandate that he should relieve them from the whole or part of their debts to Jew money-lenders. Some of the Jacobin members, discovering their colleague's foible, persuaded him to join in a revolutionary plot of which he understood nothing by promising that they would forward his schemes against the Jews. In parts of the Continent the Jews have a monopoly of more than one lucrative trade; and those who would gladly become their competitors feel towards them as Irish labourers in California regard the Chinese. The aristocracy cultivate a milder jealousy of the great financiers who are idealized in Lord BEACONSFIELD's romances. In the less civilized parts of Europe the contrast between Jewish traders and the peasantry becomes more strongly marked. The Roumanians have long set an example of persecution, which has been recently followed at a distance by enlightened Germans. At the Congress of Berlin the Roumanian Jews were thought to require and to deserve the protection of Europe; and perhaps the intervention of more than one Government in their favour may have produced a beneficial result. The Jew baiters, as they are called, use less rude methods than the Roumanian populace; but the social ostracism which they strive to enforce is in a high degree oppressive. The promoters of the movement cannot expect to drive the Jews out of Germany, or of Russia, or even to deprive them of their property. Persecution in modern times is more wanton and more spiteful than in ages when it was thought possible to exterminate an obnoxious race or sect. Even if it were expedient to destroy or expel the whole body of Jews, it is useless to make their lives miserable. The peasants of Southern Russia are more logical when they indulge, not in vituperation, but in robbery and murder.

It is not known whether the factitious German agitation has been in any way connected with the outrages which have lately been perpetrated in Odessa, and in other parts of Southern Russia. The immediate cause of the disturbances may probably have been the agricultural distress, which in some districts has amounted to famine. A starving population naturally looks to those who are

compassionately rich; both as objects of envy and as victims who may be profitably plundered. It is possible that an ignorant populace may at the same time have been influenced by sectarian and superstitious motives. The old fable of the sacrifice of Christian children as an annual Jewish rite has strangely survived in many countries from the time of HUGH of Lincoln, or perhaps from a much earlier date. Easter is consequently a dangerous season when by any means the ordinary hatred of the Jews has received some fresh impulse. On the present occasion the ringleaders of the movement have appealed to the familiar legend, probably with pretended testimony of recent renewals of traditional crime. Revenge, when it is undertaken by a starving mob, is easily associated with rapine. The rioters in many places have not only committed acts of violence against the Jews, but have robbed them of all the property that could be found. A thrifty and business-like community is not likely in a time of danger to have left the whole of its valuable possessions within reach of the robbers. The suffering which has been inflicted is severe, and it is probably unprovoked by any deviation from ordinary practice. As a general rule, the Jews are, either as money-lenders or as dealers in commodities, creditors of those among whom they live. The cultivation of animosity is greatly facilitated by visible distinctions of appearance or of costume. The Russian Jew, though he is of a different type from his co-religionists in Western Europe, is probably not less easily recognized. There is therefore no occasion for predatory mobs to practise the indiscriminate violence which was, according to the old story, enjoined by the ecclesiastical authorities on the troops which defeated and slew the Albigenses. It must be satisfactory to burn the house or seize the furniture of a creditor or wealthy neighbour who is also a heretic and an alien.

A deputation of respectable Jews to protest against the outrages has been courteously received by the EMPEROR, who will probably take steps for their protection. Shortly afterwards another deputation waited on the English FOREIGN SECRETARY with reference to the case of Mr. LEWISOHN. It is said that in the course of conversation the EMPEROR asked the delegates the pertinent question why the Jews are so unpopular. Even if they had not been disposed to speak with perfect candour, they would probably have been unable to gratify the EMPEROR's legitimate curiosity. Classes, like persons, are not sensitively alive to their own peculiarities, and they are apt to attribute any unfriendly feelings which they excite rather to their virtues than their defects. The deputation may have thought, if not said, that they were disliked by the peasantry because they were more sober, more thrifty, and more prosperous than their Christian neighbours; yet a widely-spread feeling of antipathy has for the most part some real foundation. A closely banded minority has always vices of its own. Its members act in concert against the general community, and pack their cards for their own advantage. It is to their close union among themselves that Greeks, Armenians, Quakers, and Scotchmen owe much of their success in business. Notwithstanding the doubts which he may have entertained whether the Jews were to any extent responsible for their own misfortunes, the EMPEROR may be supposed to sympathize with sufferers from lawlessness and anarchy. It is possible that among the promoters of riots which have almost approached to insurrection may have been some of the Nihilist conspirators. It may have been their interest to accustom the populace and the peasantry to violation of the law; and every disturbance increases the difficulties of the Government which they seek to overthrow. There is no doubt that the agitation will be suppressed; but the Jews will henceforth feel that they hold their property and their safety by an uncertain tenure.

AGRICULTURAL DEPRESSION IN ENGLAND.

EVERY ONE has heard of the depressed state of English agriculture. Every one knows personally or by reputation farmers who have been broken, and landlords who cannot get in their rents, and have had to face, if not ruin, yet very serious distress. A state of things has undoubtedly existed for some time, and still exists, which justly awakens much anxiety for the future of the country, and profound sympathy for the sufferers. But nothing is more difficult than to ascertain what is the real

extent of the depression, over how large a portion of England it prevails, and how far it is due to temporary or to permanent causes. If any one who was expatiating on agricultural depression was asked what was the area of which he was speaking, and whether he meant that a half, or more or less than a half, of England was affected by this depression, he would, unless he happened to be a man of extraordinary and exceptional knowledge, be utterly unable to give an answer. People know their own districts, and hear on good authority about the districts of their friends, but they only speak on very vague information as to districts with which they are unconnected. Any one, therefore, who attempts to collect something like systematic information as to a large number of counties is rendering a very great service to the public. Such an attempt has recently been made with regard to Central and Southern England by Mr. STURGE, and the statistics he has collected are of great value. He gives us a picture of the calamities of no fewer than sixteen counties, and he tells us enough to show that in those counties there is much distress, and a reduction of rents which is widely spread, if not general. But it may be remarked at the outset that he has naturally chosen the counties where depression was known to exist. A very considerable, and indeed the larger, portion of England seems as yet unaffected. There is nothing like serious depression in the Northern counties, in Wales, in the counties of the extreme South-west, or in the counties close to London. Even in the counties where depression undoubtedly exists, and as to which Mr. STURGE gives particulars, it is impossible to gather from the statistics how large a part of each county is affected. It is a rough guess, but it is apparently a safe guess, to say that serious depression has not as yet touched above a third of England. It is said that next autumn a further large number of farms will be abandoned; and it is also said that a dry year and a good harvest may still save many farmers. Things may get worse or better; but, for the moment, we want to know, not what will happen, but what has happened and is happening now. Mr. STURGE has made a most welcome contribution to our knowledge on this point. But we may preface a summary of the leading data which he furnishes by remarking that it is unwise to attach too much importance to some of the signs of calamity on which he dwells. He often tells us that the market value of land has greatly declined in the county of which he is speaking, or that farms have been let at a lower rent. Landowners are passing through a time of uncertainty almost amounting to a panic. At such a time, land, like every other commodity, falls in present value; but we can never be sure until the panic is over whether the fall is due to the mere uncertainty, or to the fact that adverse calculations are the right calculations. Landowners are, as a rule, much more uncertain than hopeless. There is a large amount of land in the market, but it is not sold because the landowners will not sell unless they get what they consider a proper price. What is now called the market price of land is often the price offered by a person who does not wish to buy to a person who does not wish to sell. Rents in a time of uncertainty fall more than the value of land, because the landlord ardently desires a present income, and he is willing to accept calculations which he thinks too adverse, partly because he cannot afford to wait, and partly because he thinks that in a short time he will be able to exact better terms.

The statistics given us by Mr. STURGE may be divided under two heads. There are the statistics which show something like ruin to the landowner, and there are the statistics which show that landowners are passing through a bad time, which may or may not be permanent. Under the former head fall such statistics as the following. In the fens of Lincolnshire many farmers would gladly let to any tenants who would pay the rates and taxes. In Huntingdonshire marsh fenland, with little or no clay under it, will hardly let at all, and many of the old tenants are continued in possession as care-takers. In western Shropshire several cold, undrained farms cannot find tenants at all. In Worcestershire, on one estate only one farm is tenanted, and it is calculated that it will require an expenditure equal to six years' rent to bring the other farms into condition again. On the stiff soils of Warwickshire most landowners have some farms unlet; on two estates the greater portion is unlet. In one parish in South Warwickshire of 3,000 acres, four-fifths are unoccupied. The meadows and pastures are let by auction, and

the adjacent fertile land is thrown in without being valued. In Northamptonshire we learn that a valuer who was recently called in to settle the rent on a cold soil farm declined to do so, saying that such land at the present time could not be said to have any letting value. At Ampthill in Bedfordshire a tenant recently refused to pay rates, because he paid no rent for his farm of 467 acres, which a few years since let at 36s. an acre. In Hertfordshire one farm of 400 acres is occupied rent free, the tenant merely agreeing to keep it in cultivation, and on another estate 1,600 acres are tenantless. In Essex a general rule was established last Michaelmas that a new tenant should hold his land rent free for one year, and then at a rent of about half of the old rent. In Oxfordshire, Mr. STURGE tells us, it is difficult to estimate the value of light poor land, as a great deal of it cannot be let at any price. On one estate of 2,000 acres there are 1,500 unoccupied. In Wiltshire a large portion of the farms on the northern edge of Salisbury Plain are unlet. On one estate in Wiltshire all the tenants have left, and the land is now covered with grass and weeds; and on another estate some of the stiff land farms have been re-let the first year rent free, and after the first year at less than half the former rent. Finally, on an estate of a moderate size in West Sussex, 5,000 acres are of the owner's hands; and on one in Hants eight out of ten large farms are tenantless, and for the most part uncultivated. All these are cases where landowners, unless they have other sources of income, must be undergoing very great distress. But it may be noticed that they are the most startling cases Mr. STURGE could find; that they extend, after all, to a very small part of England; and that what they show is that land with a stiff soil may get, after a succession of unusually wet years, into such a condition as to be temporarily valueless, and that some light poor soil has been brought under the plough which was never worth the expense of reclaiming it from the down or the firwood to which it naturally belonged.

The instances given by Mr. STURGE of reduction of rents are too numerous to make it possible to follow him through them. We may gather from them that when the land has been good, well situated, and of a character not to be much affected by wet, rents have not been reduced. Where the rain has done some damage, but not much, there has been a reduction of 10 to 15 per cent.; where the wet has done very great damage, and yet has left the land so that there is a fair prospect of it coming round, the rent has been reduced to perhaps, on an average, one-half. Dismal, and accurately dismal, as is the picture which Mr. STURGE draws, it has yet its cheering side. His statistics confirm what was said by all the most experienced witnesses who gave their evidence to the Richmond Commission—that the main cause of depression was the weather. It is mainly the rain that has beaten the farmer and impoverished the landlords. It is the special quality of the soil in reference to its liability to deterioration under heavy prolonged rain that has made farms tenantless or left the landowner with half his old rent. Dry seasons, and the expenditure of money and trouble on stiff land, will bring back the natural capacity of the soil. But even a favourable time may not bring back the old rent, as the chance of a new succession of wet years will henceforth be a recognized risk, against which the tenant will have to ensure by giving a lower average rent. Some land, but an insignificant part of the area of England, will go out of cultivation, because it is entirely unfitted for cultivation. Another part, much larger, but not anything like the bulk of English land, will continue to be cultivated at permanently lower rents on account of the specially adverse influence which successive wet seasons exercise on it. The main area of English land will be let continuously at rents possibly above, possibly below, present rents, according as felicity of situation or new skill and more capital enable, or do not enable, the cultivators to stand the pressure of foreign competition.

AMERICA.

THE contest between the President of the UNITED STATES and the section of the Republican party which follows Mr. CONKLING has thus far been decided in favour of the higher dignitary. The nomination of Mr. ROBERTSON as Collector of Customs at New York has been approved by the Senate without a division; and Mr. CONKLING has re-

signed his seat in the Senate. On the other hand, General GARFIELD, with a laudable disinclination to widen the breach, has appointed friends or dependents of Mr. CONKLING to certain vacant offices; but it is scarcely probable that he will succeed in conciliating his defeated adversary. Mr. BLAINE, Secretary of State, is thought to have achieved a political triumph by proving that the rival whose ambition he had already disappointed is unable even to secure the patronage of his own State. Before and during the Convention at Chicago Mr. CONKLING was the most active and powerful supporter of General GRANT, while Mr. BLAINE organized the majority which, after some failures, nominated General GARFIELD. It was only after some hesitation that Mr. CONKLING was persuaded to make an oratorical tour in advocacy of the claims of the Republican candidate; but he ultimately yielded to the pressure of the party on an understanding, as he alleges, that he should be rewarded with the patronage of New York. Mr. CONKLING complains that the PRESIDENT repeated the pledge either in express words or by implication in one or more interviews at Washington. He was accordingly shocked and surprised when the most valuable appointment in the gift of the PRESIDENT was given to a local opponent. In the transaction which has raised so bitter a controversy, neither party regarded the object of improving the tenure of the Civil Service. The PRESIDENT dismissed Mr. MERRITT, who seems to have been an efficient officer, for the sole purpose of making room for Mr. ROBERTSON. Mr. CONKLING'S objection to the successful candidate was not that he was incompetent, but that he had opposed the Republican Senator in the State politics of New York. There could be no doubt that General GARFIELD or Mr. BLAINE intended the nomination to operate as a challenge. Mr. MERRITT, who seems to be unconnected with Mr. CONKLING, is consoled by another lucrative office.

It is impossible for a foreigner to take interest in a personal contest between Mr. CONKLING and Mr. BLAINE; but it would seem that the result tends to limit the pretensions which since Mr. ANDREW JOHNSON'S Presidency have been advanced by senators of the dominant party. In former times the nomination of the President was usually accepted as of course, especially when his own party commanded a majority in the Senate. The rupture between Mr. ANDREW JOHNSON and the Senate, which was then largely Republican, rendered the practice of rejecting nominations usual, and for the most part final. The Senators of the majority arranged among themselves the distribution of patronage, allowing the President a certain share on condition of his acquiescence in their claims. General GRANT, who on the eve of his first election thought it expedient to concur in the clamour against Mr. ANDREW JOHNSON, found to his disappointment on acceding to office that he had weakened the executive power in favour of the Senate. After a faint attempt to secure independence, he made terms with the leading Republican Senators by transferring to them the largest portion of his own patronage. In Mr. HAYES'S time there was no overt collision. The actual PRESIDENT apparently designs to increase his own power at the expense of the politicians to whom he owes his election. He has taken advantage of the balance of parties in the Senate to exert his own prerogative. The Democrats, who, in consequence of the apostasy of MAHONE, are no longer in a majority, would probably have voted for Mr. ROBERTSON, if the Senate had divided on the question of the nomination. The appointment was perhaps confirmed because it was known that it would be supported by the Democrats and by a majority of the Republican party. For some weeks after the beginning of the Session no business was done, and the Senate found no time to meet in executive Session. It is not yet clearly understood whether the Republicans resolved to consider the nominations because appointments were evidently required for the benefit of the public service. It is understood that the Senate, in its legislative character, has resumed the former deadlock, so that the transaction of business is indefinitely postponed. Happy is the country which can afford to indulge the more important branch of its Legislature in empty trials of party strength or of personal popularity.

Mr. CONKLING seems not to have consulted his own interest in his hasty resignation. The Legislature of New York is at present Republican, but the party may not perhaps be unanimous in re-electing the former Senator. His colleague, Mr. PLATT, follows Mr. CONKLING'S fortunes with some risk to himself. Mr. GARFIELD

has probably friends at Albany, and their number may perhaps increase if they are found to be on the winning side. The Republicans of both sections are naturally annoyed with a schism which obviously tends to weaken the party, and the supremacy of the Republicans is more unstable in New York than in some other Northern States. Mr. CONKLING's influence depended principally on the skill with which he had contrived to defeat the New York Democrats. A division in the ranks of the dominant party will give fresh chances to the enemy. The blame of the division may be plausibly attributed either to Mr. BLAINE or Mr. CONKLING; but the general opinion in such cases always condemns the defeated combatant. Mr. CONKLING seems to have made a second mistake within a year in quarrelling with the President. He had previously staked his reputation as a skilful manager on the re-election of General GRANT, whose claims have since his defeat fallen into oblivion. It must be in a high degree mortifying to have been outmanœuvred by Mr. BLAINE. It is now thought probable that the autumn elections in New York, and perhaps in some other States, will, through the division in the Republican forces, result in a victory for the Democrats. The party which has been dominant for twenty years will resent the blunders of partisans who have sacrificed its supremacy to their own vanity or ambition. To foreigners it is almost as difficult to distinguish between the doctrines of the two great parties as to estimate the claims of their respective leaders; but perhaps it might be for the public benefit that the Democrats should at last have a turn of office. They are pledged by their long-continued criticism of Republican administrations to avoid their principal errors. They also include in their numbers the only supporters of sound economic policy; but probably they will not meddle with the existing tariff.

If the rebuff inflicted on Mr. CONKLING has any political motive or tendency, it must imply a belief on the part of American Senators that the powers of the President have of late years been unduly restricted. In other countries, and perhaps in the United States, it is found that patronage is most purely administered when it is concentrated in a few hands. A Minister or a President, who may perhaps not be wholly exempt from an inclination to job, soon exhausts the list of his personal connexions and favourites. He is thenceforth at liberty to reward merit and to consider ability and character; and it is his interest to surround himself with able assistants and to satisfy the public judgment by his nominations. For these reasons the President can be more safely trusted with the distribution of office than a Senator who has no pretension to patronage outside his own State, and who must reward his own local supporters out of his comparatively small resources. General GRANT would perhaps not have made so many disreputable appointments if he had not been deprived by the action of the Senate of the control of all but a limited number of appointments. In one or two instances his most creditable selections were vetoed by the Senate on the express ground that he had not sufficiently consulted the wishes of politicians of influence. The advantage of entrusting the disposal of office to the leaders of the Senate is not demonstrated by the tedious wrangle on the appointment of their own Serjeant-at-Arms and his assistants. Hundreds of competent candidates might be found; but there is no question of qualification. The Democrats insist on maintaining the present incumbents in their places, at least till the next meeting of Congress in December. The Republicans, on the other hand, with better reason, contended that a majority, however small, ought to be paramount; but the resignations of Mr. CONKLING and Mr. PLATT have for the time left the numbers equal. The argument that a majority, when it exists, should prevail is consistent with the whole spirit of the national institutions; but, unfortunately, a bare majority is unable to assert its right against a powerful Opposition. If any important question should arise, both parties might perhaps discontinue the tiresome squabble.

LOCAL INDEBTEDNESS.

THE short debate on Mr. PELL's motion to associate with the Budget a Ministerial statement of local taxation and finance was more interesting than might be supposed from the subject. The motion itself was nega-

tived, and even if it had been carried it is doubtful whether it would have had any appreciable value. The submission of an annual statement to Parliament is not always a very effectual way of calling attention to the matters embodied in it. Even the presentation of the Indian Budget, in which the Imperial Parliament is far more directly concerned than it is likely to be in the accounts of local authorities at home, is very little better than a form; and an abstract of local receipts and local expenditure might excite even less interest. It is certainly desirable that local authorities should be made to keep their accounts properly, and that facts which might have been clearly set out in four pages should not, as according to Mr. PELL they sometimes are, be spread obscurely over two hundred. Still, no matter how plain an account is made, it is useless to expect that any one who is not interested in its contents will care to read it. The people who are interested in local finance are not members of Parliament, but local ratepayers; and it is for their benefit rather than for that of the Legislature that a proper statement is desirable. If Mr. PELL could ensure the compulsory presentation of local accounts in the same form, so that the ratepayers in every district would be able to detect instantly what difference there is between their budget and the budget of some other district which is known to lay out its money to advantage, he would at least make economy possible. At present it hardly is possible. Each local authority keeps its accounts as it likes, and consequently there is no opportunity for comparing one with another. The only people whom it is of much use to impress with the importance of saving money are the people with whom it rests whether to save or to spend it. If a body of ratepayers choose to be extravagant it is not easy to say how they are to be prevented. But they may be made to be extravagant with their eyes open instead of with their eyes shut, and that is in itself a change which is worth something.

The growth of local indebtedness, which was the real burden of Mr. PELL's speech, is fast becoming a very serious matter. Local authorities all over the country are tasting to the full the sweets of borrowing money. In June 1874 they owed 84,000,000*l.* In March 1879, not quite five years later, they owed 128,000,000*l.* They now owe 150,000,000*l.*, and their indebtedness is increasing at the rate of 10,000,000*l.* a year. It cannot be denied that these are somewhat alarming figures. If they continue to reproduce themselves in the same fashion, in fifty years a local debt will have been created equal in magnitude to the Imperial Debt. In that case, what will be the security for its repayment? Mr. PELL says that the National Debt will not have to be paid off "more im-
peratively and necessarily" than these local loans. If this means that these local loans have behind them an implied Imperial guarantee—that if Birmingham, for example, were to repudiate its obligations, or Manchester were to find that the rateable property of the city was declining in value under the weight of the municipal obligations, so that every year there were greater burdens to be borne and less strength to bear them, the Legislature would have to enforce payment in the one case and to take it upon itself in the other—it is plain that Parliament ought to have something to say to these debts at the time when they are contracted as well as at the time when they will have to be paid off. It is true that the majority of the local loans are effected for fixed periods, that the money is borrowed from the Government, and the repayment of principal and interest is spread over a certain number of years. This is not the case, however, with all loans. One municipal body, Mr. PELL says, has borrowed a million of money in perpetuity, and, now that local authorities are very properly enabled to raise money in the open market, it is quite possible that they may find the terminable form of loan the less convenient of the two. Nor are these terminable loans without their inconveniences. The only just theory on which a terminable loan can be based is that the obligation of repayment should fall on those who have actually profited by the loan. The money has been borrowed for specific improvements, and it is fair enough that the cost of making those improvements should be shared by all the persons who will be the better for their being made. But, according to Mr. PELL, this simple rule is not consistently observed. The longer the time over which the repayment is distributed, the pleasanter the process becomes for those by whom the loan is raised, and the more

easy it is to induce the ratepayers to assent to it. A local authority is consequently under a strong inducement to make the period of repayment outlast the duration of the improvements. Mr. PELL mentions a case in which certain boilers that have already been repaired, and are, therefore, on the high road to being worn out, have been paid for out of money borrowed for sixty years. In other words, the ratepayers will have to go on paying for the boilers used by their predecessors perhaps forty years after these boilers have been sold as old iron. It is hard to imagine a greater temptation to repudiation than is thus supplied. Parliament can, if it chooses, do something to check this practice. In the great majority of cases money borrowed on these terms is lent by the Government, and Parliament can at least say for how long a period this money shall be lent, and what part of the principal shall be repaid each year.

Mr. GLADSTONE is seldom blind to the evils of reckless borrowing, and on Tuesday he showed himself justly impressed by the recent increase in local indebtedness. It is formidable, he said, both as indicating a vast increase in the scale of local expenditure, and as constituting a new and serious drain upon the credit of the nation. It is true, no doubt, that as regards increase of expenditure local authorities are not always free agents. Much of the money spent in recent years has been needed to effect sanitary improvements ordered by the Local Government Board, or to pay for the inspection and control which Parliament has compelled local authorities to exercise. In so far as increased local outlay is due to these causes it ought to imply a real economy in the long run. Still, even outlay which possesses this recommendation should be sharply looked after. The taste for spending money is a growing one, and a local authority which has been forced to borrow for an object in which it is not much interested may be tempted to go on borrowing for objects in which it is more interested. It was admitted in the course of the debate that local self-government tended to develop "great diversity of views among local authorities," which we take to be a complimentary way of putting the fact that, when local authorities are allowed to follow their own devices, some are extravagant and some economical. If this extravagance only affected those who are directly or indirectly responsible for it, we should entirely agree with the speaker, that this state of things is much to be preferred to centralization. But when it affects posterity still more, it may be well to check it, even at the cost of some limitation of local independence. From this point of view it is clearly a gain that Corporations should borrow in the open market rather than from the Government. It will, as Mr. GLADSTONE said, "confer a much stronger sense of responsibility, and secure a much closer attention than would be the case under the slippery and perilous idea that they could go to a central source to borrow and draw upon the nation." The experience of the colonies shows that even when great communities come into the open market they must expect to have the history and prospects of their administration closely scrutinized, and that the terms on which they are able to borrow will vary with the conclusions formed by the lenders upon these points. When local authorities at home are subjected to the same ordeal they may expect to hear some useful truths, whereas, when they have merely to send in their request to a Government office, no distinction is made between the degrees in which the several applicants possess the characteristics which go to make solvency. In the open market they will find that, though the taste for borrowing increases with its indulgence, the willingness to lend on easy terms is less expansive, and that a local authority may have some difficulty in raising money which it really wants when the best position it can offer the lender is that of tenth or twentieth mortgagee.

FRANCE.

THE recent action of France in Tunis will be convenient to historians, as enabling them to keep firm hold of the fact that in May 1881 M. FERRY's Cabinet was still living. But for the accidental help thus given, it would have been hard for them not to believe that, though no record had been kept of the fact, it had retired from office some time in the first half of the month. There has never, probably, been a case of such complete self-effacement

on the part of a Ministry as that displayed by M. FERRY and his colleagues in reference to the rival *Scrutins*. A Ministry exists, amongst other reasons, for the purpose of guiding the action of the Legislature to which it is responsible. So long as it is in accord with the majority, or is hopeful that it will shortly become so, it holds its place. So soon as it is clearly not in accord with the majority, and not immediately likely to become so, it makes way for a more fortunate successor. When the members of the Cabinet are divided upon a question upon which the Legislature has to pronounce, those who differ from the Prime Minister give up either their opinions or their places. If the seceding section is strong enough to make it impossible for the Prime Minister to carry on the Government without them, he himself makes his choice between the same alternatives. For every incident in the process there are abundant precedents. M. FERRY might have imposed his views about the *Scrutins* on his dissident colleagues or allowed his dissident colleagues to impose theirs upon him. He might have advised the President to accept their resignations, and have filled up the vacancies in his Cabinet with Ministers of the same opinion as himself, or he might have convinced the President that the strength of the party lay with his dissident, and that it would be better to find a new Prime Minister who would have a surer hold on the Chamber. M. FERRY, however, had a soul above mere servile imitation. He is of the stuff that makes precedents rather than follows them, and he has certainly succeeded in being original. Among all the things that have been said of the *Scrutin de liste* and the *Scrutin d'arrondissement* no one—at all events no Frenchman—has ever said that the difference between them is unimportant. There are those who think that the *Scrutin d'arrondissement* has been highly injurious to the political character of the Chamber; there are those who think that it is the only adequate security for a fair representation of the country. There are those who think that the *Scrutin de liste* will give a bare majority the absolute control of affairs; there are those who think that it will have so moderating an influence upon the selection of candidates that minorities will have more real if less apparent power than they have had under the existing system. But there are none who think that the substitution of one *Scrutin* for another will have no effect at all, or that the advantages and disadvantages of the change exactly balance one another. If anybody were of this opinion, it would be permissible to suppose that M. FERRY shared in it, and consequently that he was unable to summon up any degree of interest in the issue which has been so long before the country. As it is, we are forced to accept M. FERRY's own account of the matter, and to hold that he has not taken a side in the controversy because it is one which greatly divides the Republican party. A Minister has often made this a reason for leaving a particular question open when forming his Cabinet; but M. FERRY is the first Minister who has allowed it to influence him when forming his own opinion. If the substitution of the *Scrutin de liste* for the *Scrutin d'arrondissement* will be either decidedly beneficial or decidedly injurious—and that it will be one or other all Frenchmen seem satisfied—it is unusual for a Prime Minister to make the existence of a nearly equal division in the majority which placed him in office an excuse for remaining silent when the question whether the substitution shall be effected comes before the Legislature. He himself is of one opinion or the other; he thinks, that is to say, that the change will do considerable harm or considerable good. His intervention in the contest may possibly determine which side shall win; in the present instance, the narrowness of the division shows conclusively that if M. FERRY had thrown the weight of the Government on the side of the *Scrutin d'arrondissement* M. GAMBETTA would have been defeated, while, supposing him to have been on the same side as M. GAMBETTA, it would have made the victory certain beforehand. If the President of the Chamber was free to bring all his influence to bear upon the action of the deputies, why should not a similar liberty have been extended to the Prime Minister? M. FERRY can owe no duties to the Republican party which are not equally owing by M. GAMBETTA. The obligation of remaining neutral when the party is not of one mind was never heard of until M. FERRY voluntarily imposed it upon himself.

It is not Ministers only that will have to bear the discredit of the manner in which this question has been determined.

The Chamber of Deputies has equally little reason to feel satisfied with what has taken place. M. GAMBETTA's allusion to a plebiscite may have had no special meaning, though it seems to have been read in Paris as an olive-branch held out to the Bonapartists. But the smallness of the majority, taken in conjunction with the completeness of the victory, is very significant of the advance which France has made towards the recognition of what Americans call the One-Man Power. Though the motion to take the clauses into consideration was carried by only eight votes, it was universally felt that the question was decided. If the minority had been possessed of any pluck they would have seen in the smallness of the majority an ample reason for prolonging their resistance. The displacement of four members would have made the numbers equal; and, if this had been effected on the principal clause of the Bill, the victors and the vanquished would have changed places, and the next election would have taken place by *arrondissements* instead of by departments. The division of opinion in the Chamber probably represents very fairly the attitude of the country. The electors, equally with the deputies, are halting between two opinions. In these circumstances, it is generally and rightly held that it is best to make no change until the feeling in favour of making one has become more decided. It is not putting forward any exaggerated claim on behalf of the *status quo* to plead that it should not be upset until it has been ascertained beyond question that the country wishes to upset it. In the present case there was a special and powerful reason in favour of leaving things as they were. A general election will be held in the autumn, so that if the Bill had been thrown out the constituencies would have had an early opportunity of making their wishes known. The elections might for the first time have been made to turn on a question of home administration; and if there be really any decided balance of feeling among the electors in favour of the *Scrutin de liste*, the *Scrutin d'arrondissement* would have been unmistakably condemned. Only one reason could be given against thus delaying the definitive decision, but that one reason was more than adequate to the work it had to do. M. GAMBETTA wished it. The knowledge of this fact reduced the Cabinet to silence, and made the Chamber treat what in fact was scarcely more than a drawn battle as a final and decisive success. It may be that in thus allowing the will of a single politician to govern the action of the Chamber the deputies were doing the bidding of their constituents, and that, though the electors are equally indifferent to the *Scrutin de liste* and the *Scrutin d'arrondissement* when considered on their merits, they are thoroughly determined that the *Scrutin* which M. GAMBETTA prefers shall be the *Scrutin* by which the votes shall be taken. Even this, however, does not excuse the course taken by the Chamber. A Legislature owes something to itself as well as to its constituents, and it has no business to give up its own opinion at the bidding of a single man, until the wish of the electorate that it should do so has been plainly declared. The French Chamber has behaved much as the English House of Commons would have behaved if, without waiting for a General Election, it had passed a vote of want of confidence in the late Government upon a mere belief that the feeling of the country had changed.

The almost Royal progress which M. GAMBETTA is making in the South comes as a significant commentary upon the vote of last week. It is only fitting that the coming Dictator should show himself to those who are shortly to be his subjects. That his subjects are eager to have him for their sovereign there can be no question. Even if the enthusiasm be in part due to the conviction that the balloon must mount before it can descend, it is for the time perfectly unanimous. The shrewd opportunist who welcomed M. GAMBETTA as the "Candidate of France" showed that he had at least read the true significance of the *Scrutin de liste*.

LUNACY LAW AMENDMENT.

M. R. DILLWYN was plainly right in pressing his Lunacy Law Amendment Bill to a second reading. Mr. COURTNEY's speech showed that he had not allowed his mind to dwell on the provisions of the existing law. If he had done so, he could hardly have made the gene-

rons offer that the Government would take up the subject at a more convenient season. The suspicion of madness is one that no man cares to attract to himself, and the consequence of this indisposition is that cases in which the law is abused very rarely come before the world. Mr. COURTNEY asked the House to comfort itself with the reflection that "investigations into cases of lunacy must always be subject to the hazard of mischance." But the contention of the advocates of Lunacy Law Reform is that nothing worth speaking of is done to guard against the "hazard of mischance." Mr. COURTNEY speaks as though every conceivable precaution were taken to ensure that no one shall be confined as a lunatic who is not a proper subject of restraint. If this were so, he would have a right to remind us that, with all these precautions, injustice will sometimes be done. Even sane persons are not absolutely safe against false imprisonment, and lunatics can hardly hope to stand in a better position. As a matter of fact, however, the precautions taken are of the most trifling kind. They do not require any display of ingenuity to evade them. Any one can sign an order authorizing the keeper of a lunatic asylum to seize and detain an alleged lunatic, and two practising physicians, surgeons, or apothecaries can give the certificates which are required to make the order valid. There is nothing in the nature of a judicial investigation. The officers of the law are not even appealed to, except possibly to help the keeper of the asylum to effect a capture. There is nothing like this in any other department of English life. We are jealous of personal liberty in every case except the one in which there is most cause for jealousy.

A charge of lunacy is the most paralysing of all imputations. Nothing so completely unfits a man for helping himself judiciously; nothing so certainly deprives him of the help of others. Even the indignation with which the accusation is received may help to sustain it. None are so mad as those who think themselves sane, and with this cheerful maxim the bystanders dismiss any appeal for help and go about their business. When once the victim is locked up in the asylum his chance of immediate release is a poor one. Even if he were certain of being released in the end, it would be no trifling matter to be imprisoned as a madman without any just reason. But the cases in which this is likely to happen are precisely those in which the treatment is likely in the long run to supply its own justification. A man is seldom seized as a lunatic unless there is some tendency towards madness in his constitution. The experiment would be too dangerous, nor will it often suggest itself as one deserving of trial. It is the borderland between madness and sanity that supplies the cases in which the Lunacy Laws are most capable of being abused. Imprisonment as a lunatic is the most likely thing in the world to make men lunatics if they have the slightest predisposition to madness anywhere about them. They know perhaps that they have a constitutional or hereditary tendency towards brain disease, and the possibility of its becoming developed has perhaps been constantly present to them as a horror that the future may have in its keeping. When a man of this temperament finds himself in a lunatic asylum it is scarcely possible that the disease should not become active. He is prepared to doubt his own sanity, and before he has been many days in confinement he feels, and feels truly, that his doubt has become a certainty, and that he is, after all, in his right place. Yet if he had not been placed in the asylum in the first instance, he might never have become a lunatic. His brain would have remained delicate and excitable; but the boundary which divides sanity from madness would never have been crossed. There is no need, in cases of this kind, to assume that the motive which led to his imprisonment was a vicious one. His relations or friends may have honestly thought that he would be better looked after in confinement, and may have only meant to restrain him for his own good. But the law ought not to lend itself to violations of personal liberty which have no better justification than a vague impression that so-and-so is hardly fit to take care of himself. There ought to be some plain evidence that restraint is necessary before it is allowed to be imposed; and this evidence ought in all cases to be tendered by impartial witnesses and weighed by an impartial judge. What is the provision made by the existing law for securing these two ends? The impartial witnesses are two doctors picked out by the man who wishes to put the alleged lunatic in confinement.

The impartial judge is the man who wishes to put the alleged lunatic in confinement.

Mr. DILLWYN's Bill effects a considerable improvement in this respect. He proposes that the order of detention shall be made by a Justice of the Peace upon the testimony of two medical men, one of whom shall be the medical officer of the district. Mr. COURTNEY objects to this that, as the magistrate would not be required to see the patient, "there would be the appearance of an examination without the reality." It may be answered, however, that the action of the magistrates must always be determined by the evidence given by the experts. A Justice of the Peace is no more qualified than any other layman to pronounce whether an alleged lunatic may or may not be properly left at large. The advantage of Mr. DILLWYN's proposal is that it makes the order of detention come from a man who will have no wish to send the alleged lunatic into confinement, except such as may be called into being by reading the evidence, and that it provides that one at least of the witnesses by whose testimony the magistrate is to be guided shall presumably have no interest in the result. Whether the medical officer of the district is a proper person as such to be referred to in these cases is another question. But the defenders of the existing law cannot challenge his competency, inasmuch as at present any practising physician, surgeon, or apothecary whatever is held to be an expert in lunacy. Mr. DILLWYN further proposes that any Judge in Chambers, County Court Judge, or Stipendiary Magistrate may direct two medical men to report on the mental state of any inmate of a lunatic asylum, and that, if they pronounce him sane, he shall be discharged within ten days. It is not very clear how the Judge in Chambers, County Court Judge, or Stipendiary Magistrate is to be informed that there is an alleged lunatic confined in such and such an asylum into whose mental state an inquiry ought to be instituted. Of course, wherever the alleged lunatic has any friends who are convinced of his sanity, they will take care to put one of these authorities in motion. But the cases for which it is most essential to make provision are those in which there are no friends holding this conviction. Mr. DILLWYN's Bill enables those who have allies outside to profit by their aid, but it does not touch the case of those who have no allies outside. What is really needed—so long as private asylums are allowed to exist—is that every alleged lunatic confined in them shall be personally examined, at reasonably short intervals, by a competent Medical Inspector, who shall in each case make an order, either for the discharge or for the continued confinement of the patient, according to the opinion he has formed of his mental state at the time. This Medical Inspector should be an officer of the Government, and so be above any possibility of being influenced either by the proprietor of the asylum or by the friends of the patient. If to this were added a new definition of the cause that justifies restraint in cases of lunacy—a definition which should make it plain that the reason for imprisoning a lunatic is in kind identical with the reason for imprisoning a criminal, and that it only arises when the lunatic is dangerous to himself and to other people—the Lunacy Laws would no longer minister to any gross violations of justice and personal freedom. Mr. DILLWYN's Bill might usefully be amended in these directions, but, even as it is, it constitutes a real improvement upon the existing methods of dealing with lunatics. As such it deserves that a strenuous effort should be made to get it passed speedily.

THE DUKE OF ALBANY.

THE news that Her Majesty has been pleased to confer the dignity of a peer upon Prince Leopold will be received with unmingled satisfaction. That His Royal Highness alone among the sons of the Queen should have no seat in Parliament has always seemed strange, especially as on several occasions he has given evidence of mental power and social tact far above the average. The Duke of Albany has sustained with success such duties as are involved in chairmanships and the laying of foundation stones which fall so often to the share of princes, and has proved himself an able speaker on many subjects. That he should have a seat in the House of Lords, though it adds nothing to his precedence, may give him opportunities for enforcing the views of culture which he is understood to have at heart; and there can be no doubt that, young as he is, the opinions he has so far expressed have justified the confidence and hope with which, in many circles, his future career is regarded. The title he

bears has historical associations very different from those which he is likely to add to it; but it has a certain picturesque quality, so to speak, and as it has not been borne by itself in these kingdoms for more than two hundred and fifty years, whatever instance Prince Leopold may be destined to reflect upon it will be his alone.

Dukes were unknown in Scotland previous to the year 1398, when, upon the occasion of a meeting between John of Gaunt, Duke of Lancaster, and the Scots lords, to arrange terms of peace, some question of precedence seems, according to the suggestion of Douglas, to have arisen. Robert Stuart, Earl of Fife, was at this time virtually governor of the northern kingdom. His father, King Robert II., was stricken in years; his elder brother, the Earl of Carrick, was in ill health. The English prince bore the ducal title, and set a fashion for Scotland which was immediately followed. The hereditary prince, whose position had so far been sufficiently illustrated by his bearing the old title of Robert Bruce, was now made Duke of Rothesay, in the Isle of Bute; while the Regent, as if to dignify his own position to the utmost, was not content to be styled duke of a single town, or even of a county, but chose a name which, however obscurely, should denote nothing less than the whole of what we know as the Highlands of Scotland. Such seems to be the meaning of the name of Albany. Mr. Skene has used the word as signifying Celtic Scotland. It is to be found, slightly disguised, as a name for the whole island in various classical authors. There is no essential difference between it and Albion, which occurs in Aristotle. It has often been asserted that the word is an allusion to the white cliffs of our southern shores as they gleam across the Channel, while it has also been derived from the same root as Alb or Alp, a height. Shakespeare has made good use of the title in *King Lear*, the plot of which is found in many of the old romancing chroniclers, who were particularly in fashion when the House of Stuart ascended the English throne. According to them, the first Duke of Albany was named Magland, and marrying Goneril, one of the co-heiresses of Lear, or Llyr, had a son Morgan, who gave his name to a Welsh county. When Fife chose Albany for his dukedom, the meaning of the name had gradually shrunk. Long before his day the Irish historians apply Alba to Scotland; yet the other form of the name, Albion, occurs in a English charter as late as the beginning of the eleventh century; and it is possible that Ethelred, when he styled himself "monarchus totius Albionis," intended to denote that the whole of Great Britain was under his power. Ptolemy, the geographer, mentions a tribe of "Albani," who were among those he enumerates as dwelling north of the Brigantes; and some recent writers have not hesitated to identify them with the inhabitants of what is now called Breadalbane. Be this as it may, there seems little reason to doubt that when the Regent assumed the title of Duke of Albany at Scone, in 1398, the name signified to him and to his contemporaries that part of Scotland which lies north of the Firths of Clyde and Forth. He had no idea of becoming a duke *in partibus*. Albany was a place, not merely a name, and we cannot but conclude that its revival implies more than an accidental reference to the Highlands.

It is easier to localize Albany than Clarence, the second title to which Prince Leopold has been gazetted. The first Duke of Clarence was Lionel of Antwerp, one of the sons of Edward III., who had married the heiress of the Earls of Clare; but the connexion of Clarence and Clare has not been very completely made out. Of modern Clarences there are many in the New World and the colonies; and it is a coincidence that the sons of the Prince of Wales should at this very time be visiting an Albany, the seaport of that name in the remote colony of Western Australia. The oldest town, with one exception, in the United States is the capital of the great State of New York, and both are called after James II., who at the time England acquired the Dutch territory in North America was Duke of York and Albany. He was not the only unfortunate inheritor of the title. During the first few years after its assumption by Robert Stuart the course of its descent was by no means smooth. He, it is true, died peacefully in 1419; but his son and successor was the Regent, Murdoch Stuart, who, on the return of James I. from his long captivity in England, was put to death for his maladministration of the affairs of the kingdom during the King's absence. The Stuarts were never remarkable for their gratitude to those who had served them, and it may be a question how far Murdoch deserved his fate. Charles I., himself sometime Duke of Albany, sacrificed Wentworth very much as his ancestor had sacrificed Murdoch. One feels less pity for his two sons, who suffered with him, if it is true that the unpopularity of his government was greatly due to their excesses. No visitor to Stirling Castle omits to see the mound on which the three were beheaded immediately after their condemnation on the 24th May, 1425, four hundred and fifty-six years to a day before the birthday gazette of this week. The next Duke of Albany was unfortunate in another way. The Stuarts seem to have had a liability above that of other men to meet strange forms of death. Only one King of Scotland of the name, James V., died in his bed, and he of a broken heart. Alexander, Duke of Albany, was killed at Paris in a tournament. His son John, a Frenchman in all but name, was for eight years the unpopular guardian of James V., and, after his flight to France, lived at his château in Auvergne, where he had married the heiress of the De la Tours. The Duchess, who cannot have been ten years old at the time of the marriage, died childless, as did her husband, and the dukedom became once more extinct. We know the next Duke by a different name. Nine days before his marriage, Henry, Lord Darnley, was made Duke

of Albany. On his marriage he became titular King of Scotland, so that the new dukedom merged in the higher title; and on his death the dukedom may be supposed to have descended to his infant son, afterwards James VI. Before the union of the Scots and English crowns, Charles, the second son of James VI., bore the title, and two years after his father's accession he became an English peer as Duke of York, being, it is said, the only English Duke then in the peerage. Until now the Scots and English dukedoms have subsisted together. Charles I. declared his second son Duke of York and Albany at his birth, but the patent does not date before 1643. Once more, at his accession as James II., the title merged in the Crown; and though George I. gave it to his brother, Prince Ernest of Hanover, the Young Pretender called himself Count Albany, in the days of his hopeless retirement. The Countess of Albany, his widow, is the subject of a well-known and romantic story, and was buried in Santa Croce, at Florence, beside her second husband, Alfieri, the poet, at her death so recently as 1824. The united dukedoms were again twice conferred by George III., first on his brother, and at his death on Prince Frederick, his second son, who, as an infant, had been known by the oddly-sounding title of Bishop of Osnaburgh. He died three years later than the Countess, but in our own day the name was not unknown in English society. Two distinguished-looking brothers were for many years well known in London as the Counts d'Albanie. The last of them died only a year ago. An inheritor of the name survives in Austria. They had been brought up in the belief that they were descended from the Young Pretender, a persuasion harmless except perhaps to themselves, and with no base in fact sufficiently strong to bear the test of historical investigation.

It is so many centuries now since these islands saw a Duke of Albany alone, that it may be hoped all the gloomy reminiscences which surround the name have ceased to be ominous. The new Duke's title is unblemished in the ears of the present generation. The people of the Highlands, whom the Queen delights to honour, receive another proof of the Royal favour; while the revival of a dignity so ancient cannot be displeasing to any of Her Majesty's subjects. Prince Leopold has only to continue in the course he has already seemed to mark out for himself to ensure his popularity with all classes. He has inherited much that was admirable in his father's character, and has added to it his own amiable qualities. In these days of high culture, when learning and art illustrate the victories of peace, the high standard which the Duke of Albany has set up will be conspicuous in our midst; and the sixty-second birthday of our beloved monarch has been happily signalized by His Royal Highness's admission among the ranks of our hereditary legislators.

WHIPS.

THE expression of regret for the premature death of Mr. Adam, which Mr. Onslow initiated in the House of Commons on Tuesday, which Mr. Gladstone took up, and which Sir Stafford Northcote appropriately rounded off, was undoubtedly a genuine expression of feeling. Whips are either very popular or very unpopular, and if they are more frequently popular than unpopular, that is simply because an unpopular Whip is an "impossible" person in the Gallic sense. The only thing to do with him is to get rid of him as soon as possible. Mr. Adam was certainly a popular Whip, and he was also an exceedingly efficient one. There is no small testimony to the story that he, and he almost alone, prophesied, not in a mere general way, but from valid and solid grounds, the triumph of his party at the last election. It is certain, too, that he managed, under very discouraging circumstances, to keep the Opposition together in the last House in a manner which might have excited the admiration of the most cunning member of the profession from which his own temporary office derives its appellation. The Liberal party is always wont to straggle, but a Liberal party in Opposition, deserted by its natural chief for a considerable time, and then suddenly started by a sudden reappearance of that chief on a perfectly new line of country, and in pursuit of an object which it has to be persuaded it cares about, is a pack extremely difficult to keep in good hunting order. Mr. Adam's devotion to his arduous work, and to the party which imposed that work upon him, was exemplary. He continued that devotion even after the victory, which he had helped to achieve, was obtained. It is, of course, not known what the pressing necessity was which made it necessary in the interests of Liberalism that the Duke of Buckingham should be succeeded at Madras by a distinguished Parliamentary tactician of the opposite party. Despite some early Indian experience, Mr. Adam did not seem to possess any special capacities for the post, and still less any reason for desiring it. It was, to all appearance, something of a case of cutting blocks with a razor. He was not a poor man, to whom a few years in a lucrative Indian post might be a matter of moment; his health was known to be somewhat uncertain, and his abilities were altogether different from and superior to those required. Nor was he one of the useless encumbrances who have to be shelved somehow by being provided for. It must have been a special reason for hesitation with him in accepting the appointment that he was thereby deprived of the chance of showing to the various election Commissions the purity and public spirit which doubtless characterized the Liberal successes of 1880. Such a demonstration

might, for aught that was known, have contrasted strongly with possible awkward exposures on the other side. Mr. Adam must have fervently desired the opportunity of making it which might have presented itself and which he alone can have possessed. The interests of the nation and the party, however, required his absence in India, and he accepted the necessity. It must be a deep source of grief to Mr. Gladstone that this devotion should have been rewarded by such a fate. The Government have indeed been singularly unfortunate in respect to their Indian supporters. The unhappy postmaster at Bombay whose mistake was so useful to them in the matter of the Candahar division came to an evil end; and Mr. Adam, their chief of the staff, who may be said even more than Mr. Gladstone himself to have led them to victory, has died in an unhealthy climate, and in a post of no very great importance, which he had accepted no doubt to do them service. As the principal daily organ of his political beliefs justly observed, "In accepting the Governorship he, no doubt, acted on the same principle of making his own career subordinate to the interests of his party which had guided him at home." What those interests were it is, of course, impossible to say, nor is it of much importance. Devotion of any kind to whatever ideal is respectable; and devotion to the interests of the Liberal party and of Mr. Gladstone must not lose its meed of respect. That Mr. Adam discharged the duties of his Indian office with the same fidelity and intelligence which he had shown in the discharge of the duties of his English one might be taken, considering the nature of the man, for granted, even if Mr. Onslow had not definitely asserted it.

It is difficult, however, to conceive any two posts the duties of which are much more dissimilar. Irreverent persons have doubted whether Governors of Presidencies are needed at all. That is probably a mistake; and, especially in times of emergency, a Governor of Madras or of Bombay can do the State and the country he governs no small service. But in ordinary times the work, if not merely routine, is to a great extent routine. Much of it is purely ornamental; and the only fatigue it involves is the fatigue of making progress, which to a man of intelligent and active mind have compensatory interest. The work of a Whip is interesting enough, in all conscience, at times; but it has an entirely different kind of interest. It is desperately hard while it lasts, and it lasts for a very long time. The office of Whip is entirely the growth of the age-long practice in party fighting which English Parliamentary government has had. It would be impossible in countries where the Legislative Assembly is broken up into minute groups, each with its personal head; and impossible, also, in those where parties are separated by a bitter personal hatred. For a Whip is not merely, as has been said, the chief of the staff and the adjutant-general of his own party, but he is a kind of perpetual go-between between his own party and the enemy. All formal arrangements, whether for peace or war, have to be negotiated by him; and even the rank and file of the opposite party are to some extent brought personally into contact with him. The late Governor of Madras defined his own office as principally consisting in keeping members from speaking, an ingenuous exaggeration which had a considerable fund of truth at the bottom of it. In fact, however, a treatise on the whole duty of Whips by an expert would be a most complicated and curious dissertation. That duty has, indeed, somewhat changed of late years. No longer can an impecunious member of accommodating principles go to a Whip and get a fifty or a five hundred pound note for his support at a critical time; as least, if he can, the fact is not generally known. Government patronage has been wofully cut down by the abolition of sinecures, by the practical abolition of pensions for unclassified services, and above all by competitive examinations. But there are more ways of destroying the cat of scruple than by choking it with the gross material cream of pensions and gratuities, and of some of these at least a Whip ought to be master. To coax ingeniously, and to bully with exactly the proper mixture of suavity and force, ought to be his arts. If he has not now to send and fetch Sir Francis Clavering from a hell, and if the heroic method of extracting a member from a lunatic asylum which is legendarily said to have been performed on a great division some years ago is rarely resorted to, he still has to keep his flock together by cunning means, and to keep them in good humour by means still canninger. Such an incident as that of Wednesday last, when the private member rises in his majesty and complains of being defrauded by a count-out of his hard-earned private night, is a bad quarter of an hour for a Whip. For he is expected to have men in buckram ready at such times, and an ill-tempered person without the fear of principle and constituents before his eyes may play him an awkward trick some day at a critical moment. But it must be admitted that of late years the more shepherd-dog duties of Whips have been in some ways lightened. The "hundreds" are terribly severe on a member who, being elected to be Mr. Gladstone's man, fails to do due suit and service, and the "hundreds" are much more awkward things to offend than the old casual and unorganized meetings of constituents. In the more earnest centres of Britain's political life the records of division attendances are scanned with terrible care, and a member who is inattentive to three or four-thonged missives—there is a tradition of five thongs, but we are not certain that this instrument has been actually used of late years—is very promptly called to order. So that after all, as Mr. Adam himself plainly hinted in his farewell speech at Cupar, the repression of exuberant zeal rather than the stimulation of lagging indifference is the chief duty inside the House of the Whip of to-day.

He has, however, duties outside those walls which are in the long run of even greater importance, and it was in the discharge of those duties that Mr. Adam specially shone. A Whip has to take all the constituencies of the kingdom, and, what is more, all the candidates of the kingdom, to be his province—a province of terrible breadth. He ought to keep an eye on the progress of local sentiment, as furnished to him by the local party agents, to stimulate organization, &c. &c. But his very hardest duty, perhaps, is with the candidates. Every one who has studied the last election knows (to speak without offence) how very badly this part of the duty was performed on one side, and how excellently it was performed on the other. The Conservatives left seat after seat uncontested, or brought up weak candidates at the last moment. The Liberals had their candidate for every borough and county, and in most cases had him ready and before the constituency for some time previously. No doubt under the special circumstances of the time the task of the Liberal Whip was easier than that of the Conservative. Both the classes from which popular Conservative candidates are for the most part recruited—country gentlemen and rich manufacturers—had been impoverished almost hopelessly by years of bad harvests and bad trade. The average Conservative constituency—on the whole, perhaps rather to its credit—is indocile to the carpet-bagger, the casual person who is sent down by the party wire-pullers. It is much more tractable than a Liberal constituency when it has once elected a man, but is much more fastidious before he is elected. This very peculiarity, however, which might seem to facilitate the labours of a Liberal Whip, really makes them more complicated. He is troubled, as Lord Rosebery confessed at the Oupar gathering, with that ingenuousness which distinguishes the true sportsman, by an embarrassment of riches. There are hundreds of unsuccessful Professors who wish to find a new audience in Parliament; of rising lawyers who have decided that the traditional Conservatism of the Bar is a mistake; of minor municipal magnates of the great cities who, being not quite good enough for those cities, may be foisted on minor towns; of young men of wealth or position who, having been—as the phrase goes—“kept straight” with great difficulty, and prevented from avowing Toryism, are just the persons for out-of-the-way boroughs or dubious counties. The task of selection among these is a task of terrible difficulty. The coolest of heads, the widest of information, the most dexterous tact are required, to avoid the rock on which Liberal general elections so often split—the rock of a plurality of candidates and of divided allegiance. It may be questioned whether in all party history an election was so perfectly engineered as that of 1880. Its exact history we shall never know. Mr. Ellice the elder is said to have taken with him to the grave the secret of the winning of the Whig members and patrons to the Reform Bill of 1831; Mr. Adam has taken with him to the same rich repository the secret of a revolution, hardly more surprising, which took place fifty years later. It is perhaps a legitimate feather in the cap of English political life that both parties vie with each other in doing honour to the skilful player whose play was as fatal to one as it was advantageous to the other.

THE CURIOSITIES OF GAMES.

IT is singular that in a country so fond of games as England, there has been since Strutt no really good history of our favourite pastimes. Even cricket has not had the learning and perseverance devoted to its records which Mr. Julian Marshall has given to tennis. Golf has only received detached tributes, in prose and verse, like those edited by Mr. Nelson. Perhaps the future historian of cricket is even now wakening to a consciousness of his mission in the land of Spofforth, where the game appears to flourish even more than in England. If we may judge from a casual remark in Mr. Dawson's recently published *Australian Aborigines* (Melbourne: Robertson), success in football is even thought to qualify a man for a seat in the Colonial Legislature. And yet we have no history of football, a theme which may be recommended to Mr. Thomas Hughes, whose *Tom Brown* was an “epoch-making” work in the propaganda of the game. Meanwhile Mr. Macgregor has published a gossiping and readable little book on games (*Pastimes and Players*. Chatto and Windus) which we propose to use as, to be candid, an excuse for talking “shop” about British amusements.

Mr. Macgregor naturally and properly begins with cricket. He is doubtless correct in thinking that many and even heathen peoples have had the scattered elements of cricket, just as the lowest savages possess in their scattered superstitions the small change of religion. Nausicaa's game of ball, in the *Odyssey*, is taken by Chapman to have been “stool-ball,” and stool-ball is a kind of cricket suited to girls, much as “squash-racquets” is a form of racquets which may be played by ladies. All games in which runs are made off bowling are of the nature of cricket, whether the ball be thrown at the runner, as in rounders, or at the wicket. Yet base-ball, so popular in America, is only a second-rate development of germs which have grown up on English soil into the perfect and typical form of cricket. Mr. Macgregor is inclined to go back to 1300 A.D., and to the “wardrobe account” of Edward I. for the game of “creag,” in which the Prince, afterwards Edward II., was an adept. He says there is no other game “to which the name ‘creag’ can apply”; but it has *diablement changé en route*, as the French philologist observed, if it has become “cricket.” Besides, we know nothing of the

rules of creag. We might as well go back to mythical ages, when Gargantua played *La Croix*, which the English translator calls “cricket.” In a MS. of 1346, “The Romance of the Good King Alexander,” “we have a batsman, a bowler, and four fielders, who are all monks.” The bat is slightly curved, as it was till the end of the last century, and must have been adapted for slogging in the fearless old fashion. There are no stumps; but even in the picture exhibited lately at Burlington House only two stumps were used, and these very low and wide apart. Bowling must chiefly have been full-pitched, for a good length-ball would have risen above the bail. We see no resemblance between the game of “cat and dog” played by “Donald Macdonald, the Highland rogue,” and cricket. “Cat and dog,” or at all events “cat,” was the game which Bunyan was busy with at the moment of his conversion. The earliest discovered mention of cricket, by name, is in certain legal proceedings in 1593. John Parvish had enclosed a piece of common ground, on which *crickett* had long been played. In 1650 Bishop Ken “is found for the first time attempting to wield a cricket-bat” at Winchester. In the eighteenth century, in Walpole's time and Mann's, cricket became an instrument of gambling. Matches were made for 500*l.*, and, naturally, were often sold by the players. Bookmakers were as busy on cricket grounds as on races. Fortunately, though the Boat-race has got into the “books” of speculators, cricket has escaped from the taint of gambling. There are no quotations publicly made even on the University match, though we are advised that they will do wisely who accept five to two on Cambridge at the present moment. It does, indeed, seem scarcely possible that the three great brethren can go on averaging about a hundred runs an innings in every match. There must be a day when they are not on their day, and that day may shine on the Universities at Lord's. But this is a digression. The Court of King's Bench, in 1748, decided that cricket was “a very manly game, not bad in itself, but only in the ill use made of it by betting more than ten pounds on it.” Therefore, there can be no harm in taking the odds in fivers. The original Lord, like most great men, was a Scotchman, and had apparently been “out” in the Forty-five. “Thomas Lord, a ground bowler of the White Conduit Club, had left Scotland on account of his Jacobite predilections.” He flourished in London, and became the eponymous hero of Lord's, which originally occupied the site of Dorset Square. If M. Souvestre is right in thinking football a solar emblem, and that game a relic of sun-worship, there is no reason why some other inquirer should not see in Lord a solar hero. But just at present there seem to be some historical difficulties in the way of this explanation.

Cricket is apparently the only game in which Gentlemen have fairly vanquished Players. In 1837 Players had such an advantage that they were invited to defend four stumps thirty-six inches by twelve, while the wickets of the Gentlemen were but twenty-seven by eight. Yet the Players won in an innings. Mr. W. G. Grace changed the fortune of the game, and probably, even without the Graces, an Eleven of amateurs could be brought together who would beat the professionals. The match dates from 1798. The most interesting Eton and Harrow match, historically, was that in which Byron and Shakspeare bowled for Harrow, but bowled in vain (1805). A writer in a contemporary quoted by Mr. Macgregor deduces from Byron's place in the Eleven and his doings as a bowler—“he clean bowled Kayo”—that he cannot have been so lame as Mr. Trelawney and others declare. And this old score seems good historical evidence. We do not know that any other poet has been very useful in the field. Shelley's athletic performances were confined to one fight with a smaller boy, in which the bard, though he began with a knock-down blow, and quoted Homer between the rounds, was ultimately defeated, and fled away, like Hector. Mr. Matthew Arnold admits that he feels all the emotions of a barbarian when he gets a gun or a fishing-rod into his hands. But Mr. Arnold's has never been the “song of willow.” Among cricketing curiosities, Mr. Macgregor mentions the failure of the Second Royal Surrey Militia to get a single run in their first innings against Earl Winterton's club. “Fuller Pilch once bowled out eight of his antagonists for nothing.” Mr. Fraser, playing for Merton against Trinity, once took seven wickets (one of which he broke) for 0. A singular thing happened last week in Scotland when the Edinburgh Academy was playing the Grange Club, and the school wicket-keeper stamped three men off three successive balls of Mr. Hay Brown. But the most decisive of bowling feats have been performed in the University match. No one has forgotten “Cobden's year,” when Oxford had three runs to get, and Mr. Cobden bowled the three last wickets in three consecutive balls. Last year the first Cambridge bowler also took three wickets in the three first balls of an over; but the last man, escaping by a kind of miracle, revenged his companions by vigorous hitting. “Ridley's year” was even more remarkable than Cobden's, for the Cambridge man was a very fast bowler, whereas Mr. Ridley got his three wickets with slows. Mr. Macgregor speaks of the Parsee and Maori players as examples of outlandish cricketers. The Murri play very well; and when Mr. Moseley tried to bribe them to leave the game, in the interests of science, and to shoot ornithorhynchuses, they scornfully refused his un-English bribes. It is a deeply affecting fact that the cannibals of the New Hebrides are cricketers. A club was formed by some English settlers in New Caledonia, but the distances were so long, and other circumstances so adverse, that the club fell into decay. The secretary therefore instructed some

savage coolies on his estate, who took to the game with noble ardour. When they returned to their nameless island homes, he presented them with bats, wickets, and balls, and doubtless they are still batting and bowling, in the intervals of devouring missionaries and the crews of gunboats. It is greatly to be desired that the Aborigines Protection Society should send some Surrey Colts and a number of copies of the M.C.C. rules to these interesting converts. Civilization might thus be introduced in its most radiant aspect, and we might have hopes of the future of a race which is at present rather "unspeakable."

Mr. Macgregor's remarks on the curiosities of football chiefly refer to Scott's great match between "the Souters o' Selkirk" and Lord Home's retainers. Hundreds of men played in this Titanic match, which lasted for four or five hours, and was played all over the county. One horseman took part, and caught a Selkirk man, who had run about a mile and a half with the ball before he was collared. Mr. Macgregor wrote before some speculative person carried two teams of young women, in flannel trousers, all about the Border and the North of England. The young ladies, whose names were most romantic, were hooted and persecuted at Glasgow, and met with little sympathy in Edinburgh. They have also played at Preston. The performance is most unseemly, and the disgust which it has excited in the North proves that public taste still exists, though the popularity of burlesques and music-hall songs has long obscured the fact. The women, according to a critic, kicked the ball when it came in their way, but were quite incapable of playing together, and of generalship. But we do not need repulsive speculations like the "Ladies' foot-ball match" to prove that the character of woman is "individualistic," and that she is more capable of separate exertion than of united efforts. The advocates of Woman's Rights, who have been very busy this week, may take a different view of the matter, and will, perhaps, engage the "Ladies' Football Troupe" to give some of their edifying performances in London. The "Rational Dress Society" may also borrow hints from their costume.

EXETER HALL AND MR. BRADLAUGH.

OUR readers are probably aware that "the merry month of May" is a period of solemn and sacred observance to more than one section of the religious community. Among Roman Catholics, as all readers of Cardinal Newman's poems will remember, it is specially kept as "the Month of Mary," which may perhaps help to account for the somewhat perplexing current tradition that marriages in May are unlucky. Among that much larger section of the British public for whom Exeter Hall is a kind of Mecca and central shrine which, according to Sir James Stephen, "has a history, a doctrine, and a prophecy of no common significance," the sacred month is celebrated with a noisier, if not a more edifying observance. Rescued, through the good offices of the Christian Young Men's Association, from the very jaws of destruction, that holy though unconsecrated pile has this year entered on what ought, we suppose, to be called a new career of usefulness. A history no doubt, of some kind, it has, and a prophecy it may have; that it has "a doctrine," if any special and exclusive force is to be attached to the indefinite article, we should be inclined to doubt. It has many doctrines, which can hardly be said to have much in common beyond their share in what Mr. Burke once called "the great Protestant negation," and indeed this mark of negative community of sentiment it might no longer be safe too confidently to claim for it, for if we are not mistaken, the Catholic League of the Cross—that is, we believe, its correct title—under Cardinal Manning's auspices has more than once been suffered to invade the hallowed precincts; his Eminence has certainly on several occasions appeared in person on the platform. However, Exeter Hall, broadly speaking, is nothing if not Protestant, but its Protestantism takes a wide and discursive range. To cite once more the same high authority, "the changeful strain rises with the civilization of Africa, or becomes plaintive over the wrongs of chimney-boys, or pours anathemas against the successors of Peter, or in rich diapason calls on the Protestant churches to awake and evangelize the world." It has now found, as we shall presently see, a new and perhaps more suitable subject for its anathemas than the successors of Peter. That there is a certain grotesqueness, as the panegyrist of "the Olapham Sect" himself frankly admits, about the oratorical and other aspects of the Exeter Hall evangel can hardly be denied. Ours is an age, as he observes, of societies, and for every oppression that is done under the sun there is now a public meeting; for the cure of every sorrow British or other flesh is heir to there are patrons, vice-presidents, and secretaries; for the diffusion of every blessing spiritual or temporal that can cheer or elevate mankind there is at least a Committee. No doubt the obvious criticism of the profane on all this elaborate and somewhat grandiose machinery will be "Much cry and little wool," and we are afraid that the manifold spirits of beneficence and piety so loudly evoked on the platform of Exeter Hall, as each successive May comes round, from the vasty deep of the Protestant universe do not always or effectually come when they are called. But it would be hard to assume that so enormous an expenditure of well-meant energy, reinforced by no inconsiderable amount of gifts in solid cash, produces no salutary result, beyond its obvious and immediate one of acting as an innocuous safety-valve for much earnest, if not always wisely directed, enthusiasm.

Few at all events, except the small minority who are in hearty accord with the junior member for Northampton, will refuse some measure of their sympathy to the heroes of the Church Militant, or Church Suffering—for they might claim either character—of all denominations who assembled the other day at Exeter Hall to protest against "any alteration of the law for the purpose of admitting an avowed atheist to sit in Parliament." In saying this we are pronouncing no opinion as to how far we do or do not agree with the particular line advocated at the Exeter Hall meeting. With the question of Mr. Bradlaugh's admission to Parliament and of the Oaths Bill we have had, and shall have, other opportunities of dealing. Our present concern is with the peculiar tactics adopted by his admiring clients to further the objects so dear to their hearts. And here we cannot scruple to say that our sympathies go heartily with those who, in the words of the Hon. Secretary of their Committee, were simply exercising the undoubted right of Englishmen "to meet together and to hire a hall for the purpose of making a public protest against legislation that they conceive to be prejudicial to their interests," as against those champions of free thought and freedom of speech who went "in their thousands," armed with forged tickets, spurs, cat-calls, and other weapons of offence, and supported by a gang of professional pickpockets, to prevent their doing so. Even assuming for argument's sake, what will appear to most persons a tolerably strong assumption, that Mr. Bradlaugh and his friends are entirely right in their contention, and all who oppose his admission to the House of Commons, whether by a change of the law or otherwise, simply and wholly in the wrong, it equally remains true that a very large number of excellent and intelligent citizens think differently—as might be inferred from the vote of Convocation the other day—and that they have a full and manifest right to hold and avow their convictions and take all legitimate methods for enforcing them. And one might have supposed, but for the teaching of experience, that those who glory in the name of free-thinkers would be the very last to question or interfere with that right. "But this"—as Mr. Guinness, the Hon. Secretary of the Committee which organized the Exeter Hall meeting, somewhat pathetically complains—"does not seem to meet the approval of Mr. Bradlaugh's supporters." On the contrary, it appears that on the Sunday before the day advertised for the meeting a grand assemblage was held at the Hall of Science, under Mrs. Besant's graceful and genial presidency, to supplement Mr. Bradlaugh's "Appeal to the People," as the reports express it, by initiating the formation of a "League." The League, as was explained, is to have "Vice-Presidents," "Delegates," a "General Council," and an "Emergency Committee," and is to carry on by these and other means "a widespread agitation" throughout the country. Its members are not asked to make any subscription, in either sense of that word. It was indeed at first proposed that they should subscribe their names, in token of adhesion to the League, but as it was feared that this condition of membership "would create serious difficulty"—the probable candidates for admission being presumably shaky in the second of the three Rs—an amendment was carried omitting the word "written." But if the League is not conspicuous for its scholarship, it is at least to be conspicuous in its decorations. There is a dash of aestheticism not to say of ritualism about it. "Men are to wear rosettes of mauve, white, and green, and women are to provide themselves with tricolour bonnets." Miss Bradlaugh, it is gratifying to learn, has kindly consented "to receive the names of ladies willing to aid in making the rosettes." But sterner measures are to be resorted to also for attaining the desired end. There are to be petitions got up throughout the country, and a mass meeting in Hyde Park, and the London Press is to be "Boycotted," and last, but not least, the orators at the Hall of Science exhorted their hearers "to come in their thousands and try and break up the meeting proposed to be held at Exeter Hall." Our readers will observe the delicate sense of respect for freedom and toleration involved in the words we have italicized, which Mrs. Besant followed up by a second exhortation to her friends in the columns of the *National Reformer*, to get as many tickets as possible for the meeting. As the meeting was avowedly summoned, not for public discussion but to make a public protest, and tickets were offered to those only who sympathized with its objects, there was of course no way of carrying out this pacific suggestion but by falsehood or forgery, and both methods—the second especially—appear to have been extensively pursued and with entire success.

What kind of scene Exeter Hall was likely to present under the circumstances our readers may easily conceive, or rather perhaps they will find it difficult adequately to conceive. Mr. Guinness tells us that, "if the storming brigade which seized the Hall had consisted of prizefighters alone, they could not have done their work more effectively." And he proceeds to describe in detail the disinterested activity displayed by the zealous and enlightened adherents of Mr. Bradlaugh and Mrs. Besant in transferring watches and other valuables from the pockets of the "God-ites"—as they elegantly termed their opponents—to their own. A London Vicar, who was on the platform, supplies another graphic touch in a letter to the *Record*, one sentence of which may be worth quoting here:—"I had the misfortune to be set upon, struck in the face, kicked downstairs, with coat torn and hat crushed, by two cowardly fellows who were on the platform, one of whom said to the other, 'He's a — God-ite; give it him hot.'" The writer of the letter is, we believe, a High Churchman, and there

were certainly many different parties, and indeed Churches, represented on the platform. But if the *Record*, which contains a lengthened report of the meeting, is considered a suspicious authority, we may turn to the more impartial testimony of a leading article in the *Morning Post*, evidently contributed by an eye-witness of the scene he describes. It seems that the moment the doors were opened a compact gang of 500 men, many of whom had forged tickets, pushed aside the police, and took possession of the platform and the principal seats in the body of the Hall, and were followed by their allies "in shoals, four or five, arm in arm, hustling, kicking, and elbowing," while their friends outside matched tickets from the hands of those about to enter, and warned them that the Hall was already full to overflowing. One enterprising combatant in the Hall, "who used frightful language, had armed himself with spurs on his heels and elbows, so that he successfully defied ejection, and continued to exert his lungs in disgusting exclamations." Lord Percy's opening address was constantly interrupted, while "the most startling and revolting quotations from free-thought literature, whenever alluded to, were cheered to the echo." From the platform, which had been cleared by the police of its original occupants, "could be seen a determined mob of Atheists, Freelothers, and Republicans in all their power, roaring, rioting, screaming, whistling, and cat-calling at the top of their voices, and whenever there was a moment's respite in the row within, the tumult from without was heard," where, in response to the invitation at Mrs. Besant's assembly in the Hall of Science, her friends were "gathered in their thousands to try and break up the meeting." Mr. Varley, a Baptist Minister of Notting Hill, according to the *Morning Post*, made "the speech of the evening," and a pretty strong speech no doubt it was, for "he asserted in a very emphatic sentence that, not the House of Commons, but the House of Correction, was the proper place for the author of *The Impeachment of the House of Brunswick*." According to the report in the *Record* he ridiculed the idea of any right of the Northampton constituency being infringed by refusing to admit to the House a member whom they had no legal power to return. He perhaps forgot how largely Mr. Bradlaugh's return had been promoted by Dissenting votes, and how Mr. S. Morley had telegraphed his advice to support him, though he afterwards expressed his "deep regret," in a letter to the *Record*, for the unfortunate oversight which led him, "in the hurry of the moment" and his extreme eagerness to further the interests of his party, to forget his God. However it would be a mistake to suppose that the Exeter Hall meeting was by any means a distinctively Dissenting or Low Church gathering. Side by side with men like Mr. Richard Baxter and Sir Eardley Wilmot were to be seen on the platform, according to the *Morning Post*, Sir Alfred Slade, and Mr. Riddell of the English Church Union, "and several High Church and Catholic clergy." One speaker indeed called attention to the fact of Jews and Roman Catholics being united with Protestant Christians in their protest. But it is not so much the representative character of the meeting, as the outrageous character of the methods adopted by Mr. Bradlaugh's friends for interrupting it, that is chiefly deserving of attention. If this is the practical meaning of Mr. Bradlaugh's "Appeal to the People," we must venture to hope that "the People"—whether with a large P or a small one—will not be too ready to respond to it.

EXITS FROM THEATRES.

THE return recently made by the managers of the London theatres in obedience to an order of the House of Lords shows how much we should distrust what we fondly imagine to be the evidence of our senses. A great many people who "go to the play" in town are under the impression that the passages of exit from theatres are, in not a few cases, insufficient in number, narrow, and tortuous. It is very generally thought that in some houses a panic might cause a fearful catastrophe, as the stairs and corridors would immediately get blocked; and the remarks which may often be heard when the audience is leaving a theatre show how strongly many are impressed by what appears to them a possible and terrible danger at the moment when they have the best opportunity of judging. It seems, however, that this idea of danger is utterly groundless, and is, indeed, nothing but one of the many foolish alarms which agitate weak humanity. It may appear to some of us that it takes a very long time to get from the "auditorium"—to use the popular Latin word—to the entrance-lobby of a theatre; that there are many checks and much crowding and pressing during the most orderly progress; and that disorderly progress or anything like a rush would produce a block to a certainty; but this, we learn, is a pure delusion. We all walk quickly and easily from our seats to the entrance-doors, or at least we could if we chose. London theatres are amply provided with ordinary exits, and there would be no danger of a bad block in the event of fire or an alarm of fire, as there are other exits besides those commonly used, so that any theatre could be cleared speedily. Discomfort in getting out is either imaginary or due to our own stupidity. Apprehension of a great catastrophe is puerile and baseless. Such at least is the cheering conclusion to be drawn from the Return above mentioned. We may presume that it was called for in consequence of the great disaster at Nice, which disturbed for a moment the profound slumbers of the Lord Chamberlain's office. As a rule they are

deep, and are broken only by occasional tidings of short skirts. Then the officials arouse themselves for a moment, chide the manager who permits such things on his stage, give strict orders to prevent any further outrage on propriety, and swiftly betake themselves to rest again. The loss of life at Nice does seem, however, to have startled them, and to have produced a brief period of continued wakefulness. The head of the office obtained in the Upper House an order for a Return of the exits from Metropolitan theatres on the 5th of last month. It has been speedily completed, and has now been issued to the public, who will doubtless be grateful to the Lord Chamberlain's officials, and will not be so ungenerous as to ask why the information was not procured before.

As has been said, the return ought to reassure the nervous. Probably most people on reading it will be astonished to find how many ways out of theatres there are, and will wonder greatly why progress from their places to the street has so often seemed to them very long and very uncomfortable. A close examination may perhaps show that this discomfort was not wholly imaginary, and may suggest unpleasant doubts. Of these we shall shortly speak, but, before giving expression to them, it may be well to dwell on what are indisputably satisfactory features in the report. Some theatres in London are certainly well provided with exits, and there would be safety—or at all events comparative safety—in the event of fire. As might be expected, the great opera-house in Covent Garden is one of the best in this respect; though even in this theatre the arrangements are by no means perfect, as may be seen at a glance from the Return respecting it, which is as follows:—

ORCHESTRA STALLS (400 persons):

Two ordinary staircases, and one in case of need. Five ordinary doors to street, and six in case of need.

PIT (100 persons):

On the street level. Four ordinary doors to street, and six in case of need.

PIT TIER (130 persons):

Two ordinary staircases, and one in case of need. Five ordinary doors to street, and six in case of need.

GRAND TIER (130 persons):

Four ordinary staircases, one of which is 12 feet wide. Five ordinary doors to street, and six in case of need.

FIRST TIER AND BALCONY STALLS (220 persons):

Three ordinary staircases, and one in case of need. Four ordinary doors to street, and six in case of need.

UPPER BOXES (50 persons):

Two ordinary staircases, and one in case of need. Four ordinary doors to street, and six in case of need.

AMPHITHEATRE STALLS (400 persons):

One ordinary staircase, and all in case of need. One ordinary door to street, and twelve in case of need.

GALLERY (800 persons):

One ordinary staircase, and all in case of need. One ordinary door to street, and twelve in case of need.

In addition to the grand staircase, which goes from the street level to the grand tier, there is one from the street level to the first tier communicating with the grand staircase, two from grand tier to upper boxes, one from street level to the gallery communicating with another similar one from street level to the amphitheatre stalls, which also communicates with the lobbies on each tier, so that people from the gallery and amphitheatre stalls, besides having large staircases direct to Hart Street, have easy access to the whole of the entrances.

In case of fire, Her Majesty's private staircase and entrance would be available, and also three doors to the Floral Hall, which is capable of containing a much larger number of persons than the theatre, and would easily relieve all pressure from the building or entrances which might be occasioned by a crowd in the street; and there are ample means of egress at both ends into Bow Street and Covent Garden Market.

Here, although there are sufficient exits from the stalls, pit, and four tiers of boxes, there seems to be insufficient means of egress for the eight hundred occupants of the gallery and the four hundred occupants of the amphitheatre stalls. We are unable to understand how the "people from the gallery" can have easy access to all the entrances. Those who go to cheap seats are not usually encouraged to make their way to more expensive parts of the house, and possibly the doors of communication with the corridors and staircases are kept locked. There cannot be certainty that, in the event of fire, the box-keepers would have the presence of mind to unlock them all, and there might be a terrible glut on the one staircase. It should not be forgotten that at the Nice Theatre a door specially intended for exit in case of fire was found locked and could not be opened. There seems, then, to be one important defect in the arrangements at Covent Garden, though on the whole the theatre is well provided with exits. The means of egress at Drury Lane seem to be nearly as good as those at Covent Garden, and it is noteworthy that Mr. Augustus Harris places no reliance on exits which are usually kept closed. After giving the required information, he says that all "the doors, staircases, and corridors he has mentioned are open throughout every performance." We are inclined to put the Haymarket next to Drury Lane and Covent Garden in point of safety; for, though the exits are not by any means what might be desired, all the doors open outwardly—that is, they open from the theatre into the corridors, &c., and it is needless to point out how much this adds to safety. The Gaiety and the Lyceum appear at first sight to have better means of egress than the Haymarket; but a large proportion of the exits described are "extra exits," and to these there is an objection which will be shortly stated. Mr. A. Talbot Smith, who sends the Gaiety return for Mr. Hollinghead, is seemingly desirous of imitating the agreeable humour of his superior, as he states that there is an outlet from the stage by "scene door in Exeter Street, door large enough to let out a

carriage and pair." Actors and actresses are very rightly particular about their personal comfort; but we are not aware that any of them insist on driving on to or off the stage. It would have been more to the purpose if Mr. Smith had informed the public whether Mr. Hollingshead's doors open outwards, like Mr. Bancroft's, and how many carriages could drive out by the main entrance, into which the exits from stalls, balcony, and upper boxes converge.

With regard to other theatres considerable doubt and bewilderment will be felt, as any reader of the Report who is in the habit of going to play-houses, will find extraordinary difficulty in reconciling his recollections of the time and trouble required for going out with the accounts given by the managers of the exits from their theatres. To get out of them ought to be as easy as the descent of the Rigi. To suspect the managers of untruthfulness would be childish, and the unfortunate playgoer will probably be driven to the conclusion that he must have been mistaken, and that he cannot appreciate time or tell a straight path when he is on it. We may, perhaps, relieve him from the suspicion—most painful on several grounds—that frequent visits to theatres are connected with softening of the brain, by pointing out that the reports of the managers are, in some respects, a little vague. In speaking of staircases, they do not specify the lengths, or how many turns or angles there are, and these facts are not absolutely unimportant when safety has to be considered. Further, it will be found that in many cases the so-called separate exits lead into common passages, and therefore are not really separate exits at all; and that where this is the case no indication whatever is given of the angle at which the streams join. Those who have read Captain Shaw's admirable pamphlet on fires in theatres will remember that he considers this a very important matter. Most reassuring of all facts, however, to those who fear that their memories must be failing them, and least reassuring to those who fear a catastrophe, is the number of "extra" or "special" exits which go to make up the totals specified by managers. How are the audience to know of these extra exits? Frightened people will try to get out of a theatre by the same way that they came in, and it would be interesting to learn in how many cases the extra outlets are obvious and not likely to be overlooked by those who have no special knowledge of the theatre. Then, again, is it not highly probable that these outlets would, in the event of a panic, be found closed, or, at all events, closed against a portion of the audience? Not being used, in many cases, during the performance, they are, it may be presumed, usually locked; and it is too much to assume that, if an alarm arose, the attendants would immediately rush round and open them. The attendants, like other people, would be thinking of their own safety. It is to be feared that the ideas of some of the managers who have sent returns to the Lord Chamberlain resemble those of Dr. Losberne respecting burglars. He, it will be remembered, spoke as if it was the custom of housebreakers to send a notification of their intended operations a day or two beforehand. Managers seem to be under the impression that their staff will always receive reasonable notice of a fire or a panic.

Unfortunately this is not very likely to be the case until Mr. Gilbert's "resident jin" becomes a reality; and perhaps those playgoers who think that the exits from theatres are insufficient and inconvenient under ordinary circumstances, and that they would be utterly insufficient in the event of a panic, are not bereft of sense. Whether the Lord Chamberlain's counsellors will consider that any further inquiries are necessary is doubtful. Probably they are utterly exhausted by the effort they have made, and will require a long period of repose; but if happily they are still actively disposed, they will find that investigation may yet be profitably pursued. The returns of the managers are marked by that vagueness which often characterizes agreeable statements. Precise and detailed returns on certain points may well be asked for, as a great deal more information than is now given is required to show whether theatres are practically safe, or whether those are right who maintain that there is danger in London of catastrophes as terrible as those of Karlsruhe, Brooklyn, and Nice.

THE ISLE OF SAINTS.

IT is very expedient that, while Her Majesty's Government are patriotically endeavouring to pacify Ireland and to subdue her discontent at the expense of the Irish landlord, and while Mr. Gladstone is indignantly declaring that there is no confiscation in a measure which transfers from A. to B. sums variously estimated at from four to fourteen millions, the attention of English readers should not be too much diverted from the actual events in that happy land. Many explanations have been offered of the extraordinary turbulence of the Irish members at a time when they might be expected to be as mild as the milk of those cows which their constituents playfully mangle. One, and not an improbable one, is that it is a "diversion" in the military, and not the strictly Hibernian, sense of the word. The Briton, in his incurable stupidity, still turns, if not to the Parliamentary debates, at any rate to the Parliamentary summary, in his newspaper first of all; and an exciting scene, with the well-known names (which have the whish and thud of a shillelagh about their very spelling) in the middle of it, is capable of occupying him for the limited time he has at his disposal. Thus he has no leisure to turn to the

column headed "Ireland," and to admire the Apostolic virtues of Irish ministers of the gospel of ear-clipping; the patriotic and loyal eloquence of the twice-rejected scum of the Liffey and the Hudson; the valiant *faits et gestes* of the "boys" in reference to the tails, heads, bowels, and bodily arrangements generally of cows and sheep; the retiring modesty of the daughters of Ireland, which leads some hundreds of them to stone belated constables; the chivalrous feeling which induces their husbands and brothers to put them in the forefront, and cry "Shame!" if they take any harm; and all the other noble deeds which daily illustrate the Isle of Saints. The object of Mr. Healy and Mr. O'Connor, however, is not exactly the object of good Englishmen, and what they would gladly obscure we shall as gladly marshal forth and illustrate. It may be (who knows?) that the celebrated conscience of the nation, despite the hard work it has had to do of late, may between this and the end of the session give more unmistakable signs than it has yet given. Mr. Forster, with the charming *naïveté* and love of truth which makes him the pearl of all Ministers, but, it would seem, the most inconvenient of all colleagues, has defined the present condition of Ireland as "a combination to make robbery successful by armed resistance." We are very much obliged to him for the phrase, and only feel inclined to supplement it a little. We should rather call it a combination to make robbery successful by cowardly murders, by brutal outrages on animals, by presuming on the weakness of the Government, and, when it is quite safe, by armed resistance as well. It is, of course, for the people of England to say how far they will acknowledge the legitimacy of the means by authorising the Government to concede the end.

As usual, a painter of the condition of Ireland is distracted by the multitude of engaging subjects which offer themselves to him. Only an artist in glass, with the cunning advantage of innumerable separate lights and partitions, could do justice to it. That another victim of the Letterfrack outrage has died, that several Irish Jenkinses are in a position to carry their ears about them in cotton wool, and (if they choose to be so foolish) to "commit themselves to God and their country" like their great original, these are trifles. The events of the last week or ten days must be said to be the siege of Castle Gard and the arrest of Father Sheehy, with the various events which led up to and completed it. We must apologize for the tempting description, the siege of Castle Gard, for we are not absolutely certain that it was Castle Gard which was besieged and of which the garrison kept hold so valiantly. But the title is so seductive, so suggestive of chivalric associations, that we really must be allowed to identify the "old ruinous castle" near New Pallas, which for some week or so has been impregnable by Her Majesty's forces, with the Castle Gard, "a charming old fortress overgrown with creepers," which Mr. Becker describes in his *Disturbed Ireland* as lying close to the turbulent capital of the three-year-olds and the four-year-olds. The facts, at any rate, seem to be certain and the name is convenient. Yesterday week, it seems, some distrains and evictions for obnoxious non-payment of rent were ordered at New Pallas. It should be observed that the district is a very prosperous one, and that the idea of inability to pay may be dismissed as extremely unlikely to be true. However this may be, a force of police sallied from Limerick—Pallas is just on the borders of Limerick and Tipperary—to do the work. One or two ejections were effected, but then the word was passed to hold the fort. An old castle (we repeat the hope and assumption that it was Castle Gard) was manned by the defaulters; stones were thrown; loopholes were made for firearms; and the police thought it best to retire. Next day the military were called in. Four companies of infantry, one hundred police—and, according to one account, two troops of cavalry—marched to the siege of Castle Gard. The approaches were treated with considerable military skill by the garrison. Accustomed to the vigorous measures of landlords in happier times, who maintained order by the appropriate means of cruel four-pounders, they supposed (and with some justice) that artillery would be brought against them, and broke down all the bridges. These being with difficulty repaired, Her Majesty's forces, to the number of some four hundred men, three-fourths of whom were regular troops, found themselves before the fortress. With what orders or purpose they had come it is not easy to judge from the subsequent proceedings. They stood idle, unable to force their way through stone walls and forbidden to fire, while the three-year-olds and four-year-olds pelted them with heavy stones, and in some cases discharged firearms. Three men at least were put *hors de combat* by these unreturned compliments; and it is remarked, strange to say, that the troops "got a little exasperated." Then the admirable guardians of the spiritual welfare of Pallas came on the scene. That their flock should stone the soldiers was quite proper; that the soldiers should retaliate would be dreadful. So they "throw themselves between the parties and implored," &c. We do not entertain much doubt what would have been done by a resolute magistrate confident of the support of a resolute Government. The reverend gentlemen would have been gently removed, a couple of field-pieces would have been brought up, fair warning would have been given to the garrison, and at the expiry thereof Castle Gard would either have parted company with its rascally occupants or a few of the latter would have set up their everlasting rest on the spot. What was done was of course something quite different. The imposing force marched away, carrying its wounded, and leaving Castle Gard victorious. Some pretence of starving out the garrison was made,

but of course fruitlessly; and thus the authority, not merely of the law, but of the Government of England, has been illustrated in a manner very salutary, suggestive, and stimulating to the enterprising members of the "combination to rob."

The part played by the priests in this affair was bad enough, but colourable. Certain other things, some of which Mr. Forster mentioned and some of which he did not on Tuesday last, are less ambiguous and even more instructive. When archbishops behave in the way in which Dr. Croke has been behaving, the historic mind, studious of parallels, begins, in the first place, to understand the reprehensible conduct of Henry II.; and in the second, to expect many things from parish curates. The parish curates have been quite up to the mark indicated by their revered chief. Father Sheehy himself is probably no worse and no better than hundreds of his brethren. The Irish Roman Catholic clergy includes, we know, many priests who would be a credit to any Church. It is unfortunately but too true that of late years, more than ever, it has included scores and hundreds of half-educated and underbred, or rather unbred, men whose idea of their own dignity is in direct proportion to their unfitness for their office, and to the humbleness of their station and origin, and who see in the present agitation a means of regaining the position which the Irish priest once held by dint of horse-whip and excommunication. These men are infinitely greater pests to the country than the very worst of the Americanized Irish or the village ruffians, and it was high time that an example should be made of them. Their impudence may, perhaps, best be judged from the conduct of a certain reverend gentleman whose name we forget, but who has written to the Lord Lieutenant asking whether "the landlords are to be allowed to bully the people even in the house of God." This query refers to the fact that a Mr. Bourke had attended mass (as scores and hundreds of other persons have had to attend church services of every denomination in Ireland for the last year) armed. Father ———'s mild congregation on this particular occasion hooted the bully, so that it would seem as if the bullying were rather on the other side. As for Father Sheehy himself, the consequence of his pious preachings of the Gospel of Peace was that an agent was stripped to the skin, and that the railway carriage into which he got was wrecked. Another bright ornament of the Roman Catholic communion is to be found in Father Clery, whom Mr. Forster with his usual good-nature allowed to be begged off from arrest on a false plea of great age. This person asked for "a cheer for Fenianism," and said that "if he had a resolution to propose it would be one for breaking open the gaols and liberating the prisoners." Considering that Fenianism is under the direct ban of the Roman Catholic Church, the utterance is a highly instructive one. Now it must be remembered that the Land Bill, if it were passed *en bloc* to-night, would do absolutely nothing to satisfy these people. It gives what they either have already or do not want, and it does not give them what they do want, which is permission to pay rent or not just as they please. In defence of this principle a fortified place has been held successfully against troops and police, and Roman Catholic ministers of religion all over the country are justifying robbery, urging on to armed resistance, defying the law and the Government, conniving at brutal outrage on man and beast. That is the state of Ireland, and that is the state which we are told in the first place demands, and in the second place will be cured by, a mulct on the landlords of so much per cent. of their property, and a complicated arrangement of litigation which its devisers refuse to explain, and which no one else even pretends to understand. Perhaps the most pleasant part of the matter is (for persons of good memories and a turn for the humorous) to remember the prophecies with which the disestablishment of the Irish Church was urged thirteen years ago. The Roman Catholic clergy, so long estranged, were to become the firmest battalion of the English garrison; their social status would be at once improved, and the democratic element in them lessened. No longer, smarting under the unjust preference of the Church of the minority, would they encourage disaffection or wink at attempts on property. Politics, indeed, would know them no more, and they would tend the vineyard of their Master undisturbed by alien cares. Father Sheehy and Father Clery and hundreds more are, indeed, egregious examples of the truth of this prophecy. They strive not, neither cry; they are all for judgment and justice; nothing would be further from their thoughts than putting themselves forth as "men of the people," and setting classes by the ears. Without irony it may be allowed that they do tend the vineyard of their master, but then it is of a master who is not quite the same as the one originally intended.

SPRING FISHING.

IT is a decided drawback to the pleasures of the angler's life that fine weather and "fine fishing weather" are very different things. The last few weeks, notwithstanding the tendency of the winds to set towards the chilly north-east quarter, have been extremely enjoyable in the country. There has been bright sunshine with almost cloudless skies. The vegetation has come forward singularly slowly, so that the vivid freshness of the vernal green on the lattice-work of buds and bursting leaves that let the lights and shadows play through the half-covered boughs has been very unusually prolonged. But all the time the angler has been longing for the rains that have never come, and he has been only tantalized by those flying showers that, as he fondly

hoped, might be the forerunners of a downpour. The weather, in the ordinary course of things, has smaller arrears to pay off in the way of wet than perhaps he fancies. For the ground everywhere was saturated with the heavy snowfall of the winter, which has been slowly draining away. But meantime he sees or hears of rivers shrinking in their beds, and of lakes subsiding below their ordinary levels. It is delightful and romantic, no doubt, for the amateur of nature and art to wander by the banks of some silvery stream, and looking down through the limpid water to distinguish each pebble at the bottom with each submerged wisp of weed. But nothing can be more disgusting to the fisherman who had thought of filling a basket. He marks the arrow-headed wave where the trout is shooting away to take refuge in the deeper water in the holes or under the banks; and the finest fishing with the lightest tackle fails to bring the shy fish to his lure. Nor is it better in the Scotch lochs, which in more favourable years are his favourite resorts; nay, there perhaps the case is still more desperate. In the streams there is always the hope of a chance in the shadows thrown by the trees or the banks, or in the broken water at the tail of some tiny cataract. But when the still surface of the untroubled lake reflects the undimmed azure of the sky, he may as well save his arms and shoulders and spare himself the trouble of throwing his flies. Or, should the surface be broken into wavelets by a wind from the east, the fish are almost as little inclined to rise as before. Fishing out of a boat must be somewhat monotonous at the best of times, but when it resolves itself into mechanical gymnastics with none of the pleasures of hope, it becomes more monotonous than ever.

But although the year is getting on, and we are near the beginning of June, there may be brighter, or rather duller and damper, days in store for the fisherman. If he be not tied to time and place by his business engagements, he may take comfort in the thought that there is a very considerable range of climate even in these islands, and that the waters of the Continent are very accessible. The City gentlemen in the punts between Henley and Hampton may sit on their chairs, like patience on a monument, between the beaming heavens and the translucent Thames. But in the West Highlands, for example, there will surely be water overhead, or at all events watery exhalations in one shape or another. The heavy morning mists will be long of dissipating, and clouds will roll downwards in the clearest afternoon from the lofty summits of Ben More or Ben Cruachan. Indeed, as we learn from the fishing reports, the sport on Loch Awe has been more than tolerable; and Loch Awe, although overfished in these latter days, is still perhaps the most attractive of the lochs of Scotland. And, as for overfishing, where is one free from it unless you go to the wilds of Nova Scotia or Labrador? In Scotland, wherever there is a sheet of water where the speckled trout are fairly plentiful, and which is left open to the public, the fishing must be more or less of a scramble. It is either actually or practically in the hands of the innkeepers, as they have a virtual monopoly of the boats. We do not deny for a moment that a comfortable inn is a capital thing. It is something to make sure of dinner and bed, nor is cheerful company of an evening undesirable, although angling is proverbially an unsociable pursuit. Nevertheless, the new system of innkeepers who monopolize and farm the fishing has its disadvantages. In May or June the bedrooms are occupied by men with the same objects as yourself. There is but a limited number of beds, and you may find it difficult to engage one. Though a keen enough fisherman in an ordinary way, possibly you object to excessively early rising. Notwithstanding that, there is nothing for it but to be up with the grouse, or rather before him. There will certainly be a race for the little bay, on which others, as well as yourself, have set their affections. And the chances are that, in spite of self-denial and the most strenuous efforts, you are anticipated by some unscrupulous rival, who must undoubtedly have dressed in the darkness, and groped his way to the shore. The fisherman should have an ample stock of patience, but mortal patience has its limits. If he has done nothing in the cool and comparative grey of the morning, it is obviously preposterous to go on whipping the loch when experience coming to the aid of common sense has assured you that the trout are in no taking humour. The very boatmen, whose interest it is to be sanguine, have ceased to give delusive encouragement, and are muttering and grumbling despondently beneath their breath. You may lunch and lie off, waiting for better luck in the afternoon, but on the whole you deem it more advisable to go ashore for the day, and give orders accordingly to pull back to the inn. But the day is still young, and it must be killed somehow. It might be supposed that there was no great difficulty in that. If the weather is unfavourable for fishing, it is delightful for all other purposes. There is glorious scenery all around. You may wander up lonely glens and climb mountains with magnificent prospects, or, if you like it better, you may lie down with a book in the shade, giving yourself over to sleep or the *dolce far niente*. But somehow, expeditions among the mountain scenery seem to go against the grain, for as the gambler at Monte Carlo is never happy when far away from the seductive and sadly delusive tables, so the fisherman, although thoroughly out of luck, hates to altogether lose sight of the water. And as for lying still in the sensuous enjoyment of doing nothing, that needs an absolutely untroubled mind; and your mind, in place of being at peace, is worried with anxieties for the morrow. Is there any meaning in that slight fall of the barometer? or are there signs of a break-up

in the weather in that shifting of the wind towards the west? So the hours drag slowly on till dinner-time, when the party, in place of meeting in a glow of high spirits, and comparing notes on the triumphant exploits of the day, is low and somewhat silent, if not absolutely morose. But it is a long lane that has no turning, and of course fortune may spin round with the weathercock at any moment. One happy morning you awaken to a day that repays you for your disappointments and long expectation. The wind is at last in the right quarter; the clouded sky is all you have been praying for; there is tepid softness in the air, and the loch is rippling deliciously. You are conscious of the prescience of a great success, and feel that each minute is being wasted before the rod is put together and the cast of flies is dragging in the water. The result fully confirms your expectations. The starving trout come at the flies with a rush, as if they had not tasted food for a fortnight; gorging the lure at a gulp and hooking themselves entirely to your satisfaction. The top joint of the rod bends almost double, and then comes the thrilling battle with an antagonist worthy of your tackle and steel. Now he is running out fast with fathoms of line, as if he meant to tow the boat to the river which discharges the water of the loch. Now he changes his mind and dashes back, as if he meant to break the line under the keel; which, unless you play him with skill and coolness, he may very probably do. In short, till by a judicious use of the gaff or landing-net he is safely deposited in the bottom of the boat, you are kept in a constant state of intense excitement. And in a quick succession of victories of the kind you forget many days of previous disappointments, and are inclined to swear that, setting salmon-fishing aside, there is no sport to compare with first-class loch trouting.

As for a fishing tour on the Continent, we should hardly recommend it to the enthusiast who sets heavy baskets before everything else. Moreover, Continental fishing is by no means what it used to be; much excellent water that used to be free to all comes some twenty years ago is now carefully preserved; and besides, the natives are become far more knowing than they once were, fishing for the pot with stealthy skill and by all manner of unsportsmanlike dodges. The Tyrol and Salzkaunmergut have ceased to be the paradises that many roving English anglers had found them, long after Sir Humphry Davy had quitted this mortal scene. But for the tourist who makes fishing rather the pretext than the purpose of his wanderings there are still many districts that are highly to be recommended, and which have the merit of being more accessible than the Austrian dominions. Notably we have in our mind the Ardennes and Brittany; and Brittany, in particular, is most enjoyable in the early summer. The springs are late there, so the country is then in its full beauty. Especially in the seaward parishes, all through May and June, there are generally frequent showers coming up from the Atlantic, so that one is tolerably certain of finding water in the rivers. If these rivers were only as good as they look, they would come very near perfection; and as it is, we may often have a decent day, falling back upon roach or grayling if trout are not to be taken. The Breton streams run swiftly over stones and boulders, between banks they have hollowed out at the sharp bends and under the shade of overhanging trees. And even where the landscapes are more level in their character, one comes upon many a quaint old mill, with rapid currents where the river divides, and tempting bits of swirling backwater. So long as he keeps clear of any meadow-grass left to grow into hay, it is seldom the peasants interfere with the stranger, as is too often the case in Germany. Then in Brittany, where the rivers are numerous, you may change your headquarters as suits your fancy. It is needless to say that there are endless objects of interest in the picturesque old towns, which in most cases are still very much as they used to be, although they are inevitably doomed by the rage for improvements. The inns, though somewhat in the rough, are good and cheap; twice a day, thanks to the enlightened patronage of the *commis-voyageurs*, you may sit down to a plentiful repast, well cooked and well served; and the Breton bagman seems to be superior to his class elsewhere, being often a pleasant and intelligent companion. Considering the moderate length of the sea passage to St. Malo, where you find yourself disembarked to begin with in the picturesque scenery of the Rance, the trip is no very serious experiment, even should it prove a failure so far as the fishing is concerned.

THE FREIHEIT PROSECUTION.

THE trial of the editor of the *Freiheit*, an obscure German Socialist print, for the publication of a scurrilous and incendiary article, has resulted in a verdict of guilty upon all the counts of the indictment. The charge was one of libel, not merely in the sense of assailing the character of an individual, but in its technical meaning, of immoral teaching written with the view of being read and acted on and tending to the subversion of law and order. The article complained of, it will be remembered, appeared on the 18th of March last, exulted in brutal terms at the assassination of the Emperor of Russia, and contained a deliberate incitement to the repetition of such crimes, mentioning particularly the Emperor of Germany and the new Czar of Russia as fit victims for future attempts. The practical defence made was that the publication in a newspaper of such suggestions was not an encouragement to any particular person to commit the

offence within the meaning of the Act; and this point the Lord Chief Justice reserved for the consideration of the Superior Court, where it will shortly be argued.

The remaining line of defence adopted was a singularly unfortunate one; the learned counsel for the prisoner, Mr. A. M. Sullivan, M.P., addressed the jury with that fervid oratory and impassioned manner which Celtic assemblies are reported to love, but which seemed to exercise a very puzzling effect upon the twelve "good men and true" at the Old Bailey, who were obviously anxious to discuss calmly the facts of the case, and appeared immensely relieved when the Attorney-General commenced his cool and common-sense reply. Mr. Sullivan himself was quite encyclopædic in his history of former Government prosecutions for attacks on foreign potentates, citing, amongst other well-known instances, those of Lord George Gordon, who was punished for libelling Marie Antoinette; of George Vint, for a libel in the *Courier* newspaper upon the Emperor Paul of Russia; of Peltier, who was arraigned for an incitement to murder Napoleon Bonaparte when First Consul; and lastly of Dr. Bernard, who was tried as an accessory before the fact to the crime committed by Orsini and his fellow-conspirators, when several innocent persons were killed in the attempt upon the life of the Emperor Napoleon III. Without actually committing the grave error of justifying the outrage of which the article in question treated, the learned counsel laboured hard to show that tyrannicide formed a legitimate subject of political comment, inasmuch as upon a despot's life "*hangs the whole superstructure of government*" in his country—the metaphor is Mr. Sullivan's own—and asked the jury to say that, if Herr Most was to be punished for his utterances, Shakespeare was equally to be reprehended for the speech of Brutus in *Julius Cæsar*, and that Milton, Byron, Shelley, and Disraeli had all been guilty of writing similar arguments in favour of tyrannicide. The letters and comments which appeared in the *Times* at the time of the *Coup d'état* in France and Mr. Gladstone's famous letters to Lord Aberdeen upon the misdoings of the Neapolitan Government were also quoted as precedents in justification of the *Freiheit* article; the liberty of the English press and of the right of political asylum in this country were declared to be jeopardized; and dark insinuations were conveyed that "the hand of Continental Despotism" was at work, menacing our most sacred liberties, and that "Prince Bismarck was the real prosecutor in the case." Sir Henry James and the Lord Chief Justice made short work of all the fallacies of the defence. They pointed out not only the essential differences between the prosecutions quoted and the present one, but showed that all these proved that when a publication tended to weaken the bonds of civil society, the common law has always stepped in to punish and repress it. The notion that the interests of the English press were in any way bound up with such miserable and pernicious trash as the *Freiheit* was indignantly repudiated; and the argument from Shakespeare and the other great writers Lord Coleridge disposed of by pointing out that utterances put into the mouth of a dramatic character, and expressing sentiments proper to that character, differed entirely from direct regicidal teaching. He moreover pithily remarked that, if words were to be so wrested from their context, we might as reasonably accuse David of atheism by quoting only the latter clause of the verse "The fool hath said in his heart: There is no God." Two advantages at least will be secured by the verdict and the forthcoming decision upon the point of law by the Court of Crown Cases Reserved; it will henceforward be impossible for foolish or evil-minded persons to publish sentiments subversive of order and morality, and the Act of Parliament which was passed some time ago to prevent such outrages will be available for its legitimate purpose. The axiom which Lord Coleridge laid down on Wednesday that the law will defend the liberty of the press, but will not tolerate license, is somewhat trite, but cannot be too often insisted upon. The conviction of the *Freiheit* offender is an authoritative confirmation of this doctrine and a useful precedent for its application; as such it is a distinct gain to the cause of order and morality. We may deplore the necessity for using the overpowering resources of the Executive against an obscure refugee, but the same argument applies to the prosecution by the Crown of the meanest thief.

So far from the right of asylum being in any way jeopardized by the result of this trial, the best interests of the refugee class are really served by it. It is not as a working ground for conspirators that England offers its hospitality to strangers, but as a sanctuary where those may enjoy free institutions who cannot find them elsewhere. The very existence of these institutions depends upon respect for law and order and the security which they afford to life and property, and it is as law-abiding citizens that strangers are welcome among us. If they come as the avowed enemies of "authority as such," and seek to compass the destruction of the very society that protects them, their position becomes untenable, and their conduct imperils the privileges of their more orderly brethren. Herr Most has brought himself within the reach of the common law by violating one of its first precepts and principles, and neither he nor his fellow-refugees have any right to complain because it has been administered as impartially in his case as it would have been in that of a British citizen. That which has given a factitious importance to his case is that the persons whose characters are vilified and whose lives are threatened are the heads of foreign States; but the Lord Chief Justice has laid it down, and the jury have pronounced by their verdict, that it is the cause of public security alone that is vindicated.

ated, and that the offence would be equally punishable and punished if the threats had been directed against a private individual. The prisoner was recommended to mercy on the ground that this was the first number of his paper which contained such matter, and that he was a foreigner, who might have been suffering from some real or supposed grievance. As the prosecution was undertaken to uphold a principle, and not to inflict vindictive punishment, we are glad that Herr Most will have the benefit of this humane recommendation. At the same time it is difficult to see what wrong he as a German subject could have suffered at the hands of the Russian Government, of such gravity at least as in any way to excuse him for rejoicing in or wishing to compass the death of the sovereign of that country. Perhaps, however, we may learn something of the motives which actuate him and other Socialists from a slight indication which was afforded at the trial itself. The prisoner's counsel, amongst other things, stated that Most had been imprisoned in Germany for recommending his countrymen to forget and forgive the battle of Sedan. At first sight this would appear to be a most humane piece of advice, but we fear that it implies ulterior and less Christian motives. The object of the Socialists and Nihilists, or whatever the ultra-revolutionary party may call themselves, is to destroy the present state of society in order to build up on the ruins another system in which they hope to occupy a position more satisfactory to themselves. Against this scheme the old institutions of the family and the country directly militate, and accordingly Communism is advocated and patriotism discouraged, to the end that the opponents of order may form an international band strong enough to subvert the existing state of things. It is the evident presence of this danger which has induced foreign Governments to desire that international action should be taken with the view of averting it; and it is the knowledge of this which makes any Government action in this country so jealously watched when it appears to tend in the least in this direction. We are strong enough in the possession of our own liberties to feel secure against any serious menace from Socialism in England, and have no reason and no taste for interference in the matter; but we have all the more reason for jealously guarding the integrity of our institutions and the majesty of our laws, and it is our duty to vindicate these unflinchingly whenever they are violated.

THE ADJOURNMENT OF THE MONETARY CONFERENCE.

THE Monetary Conference has been adjourned for six weeks, and there are doubts whether it will ever reassemble. Indeed, some of the delegates proposed an indefinite adjournment, but to the majority that seemed too plain a confession of failure, and it was decided that the suspension of the sittings should be for no more than six weeks. There seems, however, no reason for their resumption. The discussions so far have been purely academic. Most of the delegates seemed to desire rather to air their own crotchets and bring themselves before the world than to promote the object for which they were called together. M. Cernuschi was the worst offender in this respect; but all his colleagues are more or less open to the reproach. They allowed themselves a latitude in expressing their individual opinions which is not a little surprising when we consider that they were the representatives of the leading Governments of the world. Still, the Conference has been the means of bringing together some interesting information, and furthermore, has removed doubts as to the intentions of the several Governments respecting the silver question. Everybody knew beforehand that this country would not change its monetary system. But there were doubts respecting Germany, which seemed at least to have some reasonable foundation. The facility with which Prince Bismarck threw over Free-trade and returned to Protection afforded evidence that he would readily adopt bimetalism if he thought it would advance his views in any respect, while the famous comparison of the supply of gold to a blanket thrown over two men seemed to imply that he was really meditating a change of front in the monetary question also. Besides, the sales of silver had caused considerable loss—so considerable, indeed, that he had been obliged to suspend them—and it appeared not impossible, therefore, that he might enter into an arrangement with France and the United States. The intentions of the minor Governments are of less importance, but it is still worth while noting that Sweden, Norway, Denmark, and Portugal are all resolved to maintain the single gold standard, and that apparently Belgium and Switzerland are disposed to break away from the Latin Union, should France and Italy again allow the free coinage of silver. On this point, however, we must not be too confident; for, as we have already said, the delegates at the Conference allowed themselves a latitude which is misleading as to the real views of their Governments. For instance, Sir Louis Mallet expressed opinions which have since been disavowed by Lord Hartington in the House of Commons. We do not wish to pin Sir Louis to language which he seems partially to disavow in the communication read by Lord Hartington in the House of Commons; but we do not attach any importance to his declaration that he warned the Conference that he was expressing only his own opinions. A mere preface to a speech delivered in a Conference which he was attending as the representative of the Indian Government, containing the statement that he was only expressing his own opinions, could not be expected to carry very much weight with those who listened to him. Naturally

they would say that he would not go beyond the instructions of his own Government, and that if his language seemed to do so, it was still in accordance with the unexpressed wishes of those whom he represented. It is impossible, therefore, that the indiscreet advocacy of bimetalism by Sir Louis Mallet should not compromise his Government in the estimation of foreigners. They will say, and not without some grounds, that the Indian Government is restrained from doing what it would wish by the British Government, and that Sir Louis expressed the real wishes of the Indian Government as distinguished from the Home Government. And we are bound to add that the instructions given to Sir Louis and Lord Reay lend colour to this view of the matter.

Those instructions authorized the Indian delegates to undertake upon the part of the Indian Government not to change its present monetary system for a period of years, to be determined by subsequent negotiation, provided some of the principal Governments would open their mints to the free coinage of silver, in the proportion of 15½ of silver and 1 of gold. If, however, none of the other Governments would stipulate as required, care was to be taken to reserve India's right to change her monetary system, if she pleased. We fail to see the object of insisting upon the proportion of 15½ to 1. What is required by the Indian Government is to put a stop to the loss by exchange, and that would be done if silver recovered the value it had before the Franco-German War. But that value was maintained for a long period without the general observance of the ratio here insisted upon. That ratio, it is true, was the ratio of France and the other countries of the Latin Union, but it was not the ratio of the United States. Unless, therefore, the Indian Government is an advocate for bimetalism, and bimetalism, too, in the special form supported by M. Cernuschi, we cannot see why it should affect to make the retention of its present monetary system conditional on the adoption of this exact proportion of 15½ to 1 by the other Governments. That it has done so, therefore, seems to lend colour to the view taken abroad that Sir Louis Mallet, in advocating bimetalism, was really giving expression to the wishes of the Indian Government. Of course, we are aware that he was not doing so. A very large number of the officials of the India Office, and of the officials in India itself, are in favour of bimetalism; but the Indian Government, as distinguished from Indian officialism, is not so; indeed, the Indian Government, in this sense of the word, can hardly be distinguished from the British Government. But the fact that the Government is not in favour of bimetalism renders this portion of the instructions all the more unwise and illogical. That, however, is the least fault of the instructions. What appears to us still more objectionable is the want of candour and the spirit of bargaining which pervade them. There is a kind of insinuation that, unless some of the leading Governments will adopt bimetalism, India will reject the single silver standard. Now we know quite well that India will not reject the single silver standard. She cannot afford to do so, even if she would. And, if she could afford it, it would be unwise. But it is enough to say she cannot afford it. The immense mass of silver which circulates in India could not find a market if demonetized, and India is too poor a country to suffer the enormous loss which would thus be entailed upon it. Threats, therefore, of demonetizing silver in India are empty and futile, and ought not to be even insinuated by a great Government. In the same way the spirit of bargaining which pervades the instructions is unworthy and undignified. Since India cannot demonetize silver even if she wished to do so, it would be much more straightforward as well as more dignified to say frankly that India has no intention to change its present monetary system; but that, if it would give more confidence to countries wishing to adopt bimetalism, she is willing to enter into a solemn engagement that she will not make any change for any number of years the other contracting parties may ask. There would be common-sense as well as straightforward dealing in doing this; but in the course that has been adopted we fail to see either sound policy or good diplomacy. The French and Americans know quite as well as we do that the Indian Government cannot afford to demonetize silver, and, therefore, are not likely to be alarmed by the threat hinted.

If France and the United States really wish to bring the work of the Conference to a practical conclusion, it would be more prudent not to reassemble the delegates. We are ourselves of opinion that the wiser course to adopt would be to drop the whole matter, and allow events to decide the fate of silver. Germany would then soon discover that it could not sell its silver without greater loss than the frugal German Government is willing to incur, and perforce would be obliged to find some use at home for its surplus metal. The East, too, would gradually absorb a great quantity of the metal that is pressing upon the European markets. Thus, in the long run, the price would attain a level which it would steadily maintain. That is all that is really required in the interests of trade. But, if the French and American Governments are not content to do this, their next best course is to drop the Conference altogether, and proceed to negotiations. They see that bimetalism will not be adopted by England, Germany, the Scandinavian kingdoms, and Portugal; but Holland and Italy are inclined towards it, and Belgium and Switzerland may also be persuaded perhaps to remain in the Latin Union. The frank adoption of bimetalism by those six countries would do much to rehabilitate silver. It remains to be seen whether silver would be accepted by the people of France and the United States. At present it is not so accepted. It accumulates in the Bank of France and in the Treasury of the United States. As fast as it is paid out by the one or the other Government it is

add in again. But it is, of course, possible, if France, the United States, Italy, Holland, Belgium, and Switzerland were all to open their mints to the free coinage of silver, that the price would rise sufficiently to give confidence to the public, and that after a while it would circulate as freely as ever. This does not seem likely to us, because the prejudice against silver is very strong: and, besides, the metal is both cumbersome and inconvenient. Still, more difficult things have been brought to pass. Along with this adoption of bimetalism by the six countries named, a negotiation might be carried on with Germany on the lines laid down by Baron Thielmann in the Conference—namely, that Germany should undertake not to sell any silver for a specified number of years, and that it should call in its smaller gold coins, and re-mint its silver in the proportion of 15½ to 1, making silver full legal tender for all debts up to 10*l*. That would undoubtedly give employment to a considerable amount of silver in Germany, and it would set free a proportionate amount of gold. It has been suggested that England also might enter into a similar arrangement. She might call in and melt down all her half-sovereigns, and engage not to coin a smaller gold piece than a sovereign, and might make silver legal tender for sums up to 10*l*., at the same time re-coining her silver, so as to make the silver pieces of the full value they represent. That would entail a considerable cost, and it would impose inconvenience upon the public. But England, of course, is rich enough to bear a little cost, and the inconvenience would not be such as to form a very great obstacle. We see no very serious objection, provided the free coinage of silver is not asked for. The coinage of silver should remain as it is at present—a Crown prerogative only. The public should be allowed, as they are now, to send gold to the Mint in any amount they chose, but silver should be coined only by the Crown. The sole change then that would be made would be that silver, instead of being token money, as it is at present, worth considerably less than it passes for in trade, would be in intrinsic value worth as much as it professed to be, and would legally discharge debts up to 10*l*. That would not be an essential change of our present system, and might be done if it seemed likely to rehabilitate silver.

THE PICTURE GALLERIES.

IV.

AMONG the works of design to be found at the Grosvenor Gallery the "Endymion" (56) of Mr. Watts is especially remarkable. Few artists of our day, either in England or on the Continent, are so constant in the endeavour to express in painting the highest order of poetical thought. In the attempt to give defined shape to an intellectual idea Mr. Watts is now and then carried beyond the limits of pictorial art, and is betrayed into the sort of failure that appears in an exaggerated form in the fantastic invention of Blake. "The Genius of Greek Poetry" (55) is a favourable instance of incomplete achievement in this kind. It is marked by considerable charm of colour and by a certain suggestive beauty in the treatment of form, but it inspires us with no conviction that the painter could give absolute distinctness to the design if he were called upon to work it out upon a larger scale and with greater precision of imagery. A part of the fascination which the picture may be allowed to possess depends indeed upon its incompleteness. It is evident that the painter has not entirely mastered the difficult problem he has undertaken to solve, and we are left with the impression that the result does not quite sufficiently establish the fitness of the subject for translation into the limited language of painting. The full-length figure to which Mr. Watts has given the title of "Arcadia" (57) suggests criticism of a wholly different sort. There is here no lack of the precision that should belong to a work of style; all the parts of the design are clearly and fully made out, and although something still remains to be done in regard to refinement of colour, it is work of a kind that lies clearly within the artist's powers of accomplishment. But when the picture has been completed according to its intention, it may be doubted whether it will rank with the best that Mr. Watts can do. The signs of individual invention are overweighed by qualities that may be traced to great example in the past; it is the expression of what the painter has acquired by the study of traditional excellence rather than the result of direct observation of nature, and to this extent, therefore, the result lacks the stamp of vitality and power. These two examples represent the opposite extremes of Mr. Watts's talent. On the one hand, there is a strong and genuine poetical gift, seeking, with something of hesitation and uncertainty, to accommodate itself to the settled conditions of pictorial design; and, on the other, we have an ample display of the artist's knowledge of these conditions, exercised in a manner that just misses the charm of individuality. "The Endymion," of which mention has already been made, is specially remarkable as affording an instance of the successful association of these qualities. The poetry of thought is here successfully reconciled with the strict requirements of paintings. The scheme of the picture, in spite of its fantastic character, has been found capable of complete definition, and we are not left to feel that there is something more to be said which some other art could more fitly utter. The figure of Diana as she stoops to touch the lips of Endymion is imaged against the dark sky in lines that sug-

gest the shape of the crescent moon; the pale draperies fluttering around her graceful limbs and the still paler flesh tints of her face and neck, contrasted with the sun-tanned skin of the sleeping shepherd, are skilfully contrived to enforce the same idea; and yet, although the mystic beauty of the legend is thus successfully presented, the design, as a whole, is carried out with a force and solidity of modelling, and with so much of human sympathy in the treatment of expression in the faces, that it tells with a sufficient effect of beauty even before we have had time to realize the poetic idea which it is intended to illustrate.

In the same panel with Mr. Watts's work hangs a very interesting little picture, by Mr. Walter Maclaren, of a Capri woman bathing her infant child. Mr. Maclaren has been content to take his subject from common life, but he brings to its interpretation a finely-cultivated sense of style; and, without falsifying the facts of nature, he has been enabled to produce a graceful and dignified design. In all matters of essential truth, in the frightened gesture of the naked child, and in the pose and movement of the female figure, he has kept strictly to the guidance of reality; it is only in the choice of form and in the treatment of the drapery that he has sought to correct the accidents of nature, and thus to give to his picture an added quality of beauty. Such work as this suggests how inexhaustible is the material at the command of art, even without diverging at all into the realm of poetical invention. A refined perception and a trained taste and power suffice of themselves to bestow a permanent charm upon the commonest facts; and there is small need to cast about for dramatic incident, or for scenes of strong pathos, when the simplest occupations of everyday life can be made to yield so beautiful a result. Nor is there any force of emotional expression that will atone for the absence of these finer qualities of style. Whatever interest of an intellectual sort a painter may choose to grant to his design must always be gratuitously bestowed; it cannot in any case be accepted in exchange for what is essential to every work of art, no matter how potent its theme may be. Mr. Armstrong's "Girl at a Fountain" (61) is executed upon the same principles as Mr. Maclaren has followed; and in the next room is to be found a very complete example of the style (137) by Mr. Albert Moore. Of artistic taste there is certainly no lack in the two frieze-shaped designs by Mr. Walter Crane, although the technical power needed to give effect to his ideas is not always forthcoming. Mr. Crane knows well how to make a picture tell its story, and he has besides a feeling for the ornamental beauty of landscape background which always gives added refinement to his work. If it were not for obvious and sometimes glaring defects of drawing, which seriously damage the effect of his design, the two pictures contributed to the present exhibition would deserve to rank among the best he has yet produced. It is indeed much to be regretted that an artist so richly gifted with creative fancy should, so far, have failed to perfect the means of doing adequate justice to his ideas, especially when it is remembered that in purely decorative art his drawing is often of admirable quality. Perhaps of all artists now exhibiting in London, Mr. Alma-Tadema leaves the least to be desired in this respect. The little picture in the Grosvenor Gallery is, indeed, a miracle of complete and finished workmanship; and one is almost tempted to forget the subject altogether in the inexhaustible interest that belongs to the subtle details of the painting. And yet Mr. Alma-Tadema has by no means neglected the dramatic point of his composition. His arrangement of the scene as a whole, as well as the treatment of individual faces, displays a rare illustrative power and a fine sense of dramatic character. The action of the soldier as he draws aside the curtain which conceals the timorous Olandius is effectively contrasted with the riotous demeanour of the drunken troop of guards and women who crowd the entrance of the chamber; while the confused heap of dead bodies lying between the two groups gives a sinister significance, both to the Emperor's terror-stricken face and to the wild laughter of his followers. It would be wholly impossible by description to give any idea of the technical mastery with which this scene is rendered. We may observe, however, that the workmanship, even where it is most minute, lacks nothing of breadth or simplicity. In this respect Mr. Alma-Tadema's talent recalls that of Terburg; for, like the great Dutchman of the seventeenth century, he can imitate varied surfaces and textures almost to the point of illusion, and yet preserve a freedom and individuality of touch that effectually avoids any overpowering impression of mechanical labour or fatigue. It marks a sharp contrast in every sense to turn from this little picture by Mr. Alma-Tadema to the large decorative canvas of Mr. Britten. Here the immature resources of the artist lag far behind the clever motive of his design. Mr. Britten may be credited with a full measure of the youthful failing of audacity and with some other youthful qualities that are of rarer growth. However imperfect the execution of his design, it has at least the merit that belongs to a consistent and individual invention. The scene of Helen's Flight has been conceived in a form that owes nothing to tradition, but the result is not therefore to be dismissed as the fruit of mere wilful eccentricity. According to his own idea of the subject, the general plan of the design is, indeed, very successfully worked out; there is a sustained impression of life and movement often wanting to decorative work of much higher pretension, and there is besides a fearless acceptance of reality in the treatment of certain of the accessories of the scene which bears witness to a true artistic instinct. As regards the actual painting, Mr. Britten has suffered from indecision of purpose as

well as from imperfect resource. He has apparently not quite made up his mind how far the colouring of such a design might be reconciled with the claims of modern realism. Some of the draperies are handled with regard solely to decorative effect, but elsewhere there is an attempt to throw the figures into the landscape, and to treat the whole picture in the brilliant tones of open sunlight. But, in spite of this apparent confusion of style and of grave defects in drawing which can be less readily excused, the picture is at least sufficiently striking to awaken a good deal of interest in Mr. Britten's future career. If it has all the faults, it has also much of the promise, that belongs to youthful performance. Another interesting experiment by a young artist is Mr. Weguelin's "Roman Acrobat" (159). It is easy, of course, to perceive that the influence of Mr. Alma-Tadema has been at work here, and that his example has been followed, not merely in the actual processes of the painting, but in the choice and arrangement of the composition. Mr. Weguelin bestows much care upon the representation of marble surfaces, though he is still a long way behind his master. To imitate the occasional caprice and oddity of Mr. Tadema's mode of treating a subject is a somewhat easier achievement, and the disposition of the principal figure is in this sense fairly successful. The most unfavourable criticism suggested by the picture is that Mr. Weguelin has failed to get any great beauty of form or movement out of his subject. The figure of the acrobat displays somewhat too much of prosaic realism; the eye is arrested at once by the swollen deformity of the feet and by a certain commonness in the proportions of the limbs. In the painting of the figure also there is almost unnecessary coarseness of colour and modelling. The light from above falls upon the bare shoulders with an effect that tells rather as paint than as tone, and the quality of the colour is lacking in refinement. What is best in the picture is the vivid realism of the scene as a whole. The different expressions upon the faces of the spectators below are admirably rendered, and so also is the unconcerned look of the acrobat herself, intent upon her business, and indifferent to the effect of the performance.

To the large picture by Sir Coutts Lindsay we have already referred on a former occasion. It is certainly a very striking achievement, marked by strong dramatic imagination and by unsuspected artistic resource. To attain absolute success in the rendering of such a theme would test the power of the greatest painter of any age; and it is therefore no wonder that the execution in this case should often fall short of the dignity of the idea. In respect of draughtsmanship, there is evidence both of incomplete technical training and of insufficient practice; but against these defects must be set a fine feeling for the beauty of form and a very rare gift of constructive composition. Few English artists possess the taste and cultivated sense of style that Sir Coutts Lindsay has brought to his task; and, although the result misses absolute success, it is at least entirely devoid of vulgar pretence or affectation.

REVIEWS.

WILLIAM WHEWELL.*

DR. WHEWELL'S relations and friends have not acted wisely in the matter of his biography. When he died in 1866 there was a general feeling that his life ought to be written. He had been Master of Trinity College for a quarter of a century, and a member of the University for more than twice that number of years. From first to last he had occupied a position of singular prominence in a singularly eventful period, not merely in the microcosm of Cambridge, but in the world of science and letters both in England and on the Continent. Such a career must of necessity contain much that would be of permanent interest. To relate it successfully, however, two conditions should have been fulfilled. In the first place the biography should have been published without delay, for in Universities, more than in any other place, society changes rapidly, and even the greatest of men soon pass out of recollection; and secondly, it should not have been published in two divisions, of which one did not appear until ten years after his death, and the other is now before us. By this strange and unprecedented course an incomplete and—we venture to say—a wholly erroneous view of Dr. Whewell's personality has been given to the public. His life, more than that of most men whose time is absorbed by the most sharply contrasted occupations, was not parcelled out into periods according to the labour that he had set himself to do for the moment. The routine of College and University work did not in his case exclude scientific pursuits. His extraordinary energy, his power of absorbing himself in what he was engaged upon, enabled him to carry them on in the midst of all those vexatious details of office that usually render exact thought and literary composition impossible. Again, no matter how busy he was, he found time for society, for correspondence, and for attention to all that was going forward in literature and education. Yet from the first his representatives conceived the idea of having his biography subdivided. Their original notion was that it should be

published in three separate portions; (1) the scientific; (2) that which concerned the University and the college; (3) the domestic. The first of these was entrusted to Mr. Todhunter, of St. John's College. He performed his task with such admirable method that a general regret was felt that the whole had not been put into his hands. The second, after having been assigned to more than one person, and abandoned for reasons which it is needless to go into now, has finally been amalgamated with the third, and published by Mrs. Stair Douglas, Dr. Whewell's niece by marriage. She had originally intended to write the domestic portion only, and we can readily understand the unwillingness—of which she speaks in her preface—with which she approached subjects with which she must have been wholly unacquainted, and which are so technical that a stranger to Cambridge cannot hope to write about them without mistakes. She has been singularly unfortunate, too, in losing the help of Mr. James Lemprière Hammond at the very last moment. He had been a Fellow of Trinity College during the most eventful portions of Dr. Whewell's Mastership—the discussions on the revision of the statutes that commenced in 1857—and though he had felt it to be his duty to take a line in College affairs that placed him in direct opposition to Dr. Whewell's most cherished convictions, his judgment and conduct won his admiration first and his friendship afterwards. He was, therefore, in every way exceedingly well qualified for the office of biographer. The assistance given by him is fully acknowledged in the preface; but we can hardly believe it possible that, after his death, no other member of Trinity College could be found to give his help—"all such attempts having previously led but to delay and disappointment," as she says. Indeed, we are in a position to state that at least three competent persons are in existence there at the present moment, any one of whom would have gladly placed a large portion of his time at her disposal had she thought proper to ask for it. As it is, the absence of a supervising intelligence is painfully evident. To begin with, the book is far too long, and much of it is excessively dull. One-third, at least, of the letters might have been omitted with advantage. What light is thrown on Dr. Whewell's character by the preservation of trivial details about mishaps in travel and the like? Again, the number of misprints shows that Mrs. Stair Douglas is a novice at the technical business of seeing a book through the press. A more serious objection, however, to the convenience and utility of the book is the total absence of elucidation. A text should not be overlaid with notes; but when several hundred letters are presented to us, full of references to contemporary persons and events, some help is necessary. For instance, when Dr. Whewell, writing in 1836, says "there are a great number of points with regard to my future course of life which it seems to me as if I should be able to settle much more clearly if my book were fairly published" (p. 180), we should like to know on what book he was engaged. By turning to Mr. Todhunter's work, it is easy to discover that it was the *History of the Inductive Sciences*; but surely Mrs. Stair Douglas ought to have given a reference to him. All readers cannot have his book beside them while reading hers; and, without it, much that she prints is unintelligible. Strange to say, however, with the exception of a short passage in the preface, she never alludes to it at all. On the other hand, all old Trinity men ought to be grateful to her for her labours, and especially for the prominence which she has given to a side of Dr. Whewell's character of which probably few suspected the existence. We mean the warm affection which he felt towards his friends, and the tenderness of heart which was always yearning for sympathetic companionship.

We have no space for a systematic review of Mrs. Stair Douglas's book, or a detailed account of Dr. Whewell's life. We propose to attempt no more than a short description of him, assisted by the new information which has now been set before us. It is no exaggeration to say that, after he became Master of Trinity, he exercised, both in his own College and in the University at large, an almost unchallenged supremacy. He owed this as much to his splendid bodily presence as to his high character and great mental powers. "What a pugilist you would have made, sir," said Jackson to him, when he was taking some lessons in self-defence from that distinguished master of the art. Then he had a loud and cheery voice, and a countenance of which the gravity has been rather exaggerated in his portraits and in Woolner's statue. His eye was of that rarest quality in a man, a perfect blue, and he had a Titanic brow. A squire friend of his dwells upon the almost awe with which, suddenly looking up at a small dinner-party in Whewell's later days at his country house during Christmas-tide, he saw three brows simultaneously bending down over his table, all magnificent, and all singularly alike in conformation—those of Whewell, of Mason, envoy to England from the Confederate States, and of the genial painter Webster, still living. He had a keen sense of humour, and dearly loved a good joke or a funny story, both of which he told exceedingly well. But, though he took his degree so far back as 1816, a time when society was by no means refined, and the habits of Combination-rooms would have disgraced an alehouse, his conversation was never coarse, nor, even in his younger days, did he give way to any excess. The health of this sturdy son of Lancashire, except during his boyhood, was always excellent. No rebellious liver ever troubled his repose or made him look upon life with a jaundiced eye. It was his habit to sit up late; but, notwithstanding, he appeared regularly at morning chapel, then at 7 A.M., fresh and radiant, and ready for the day's

* *The Life of William Whewell, D.D., late Master of Trin. Coll., Cam., and Selections from his Correspondence.* By Mrs. Stair Douglas. London: C. Kegan Paul & Co.

work. This vigour of body enabled him to appreciate everything with a keenness which age could not dull, nor the most poignant grief extinguish except for the briefest intervals. He thoroughly enjoyed life, both its material and intellectual side. He would discuss a philosophical problem, or amuse a young lady with the plot of the latest novel, or kneel down on the carpet to play with a Skye terrier, or enjoy a good dinner, or drink a bottle of port, with equal heartiness.

Our own recollections of him previous to 1841 are of necessity vague. We can recall, however, a personage who was prominent even in the brilliant intellectual society that was then the boast of Trinity College, without whom no social gathering was thought complete, and who, in his hours of relaxation, was ready to take part in any piece of rollicking fun that might be going forward, not disdaining even a practical joke upon occasion. He was fond of the society of ladies, whom he perhaps found more tolerant listeners than men. He readily entered into correspondence with them, wrote riddles and verses and translated German poems for their amusement, and assisted approvingly at the musical parties which were then the fashion. There were several houses in Cambridge in which we should have ventured to say that he was a "tame cat," had there been anything feline in that rude and vehement nature, which was happily described as "Rough Diamond" in one of the cleverest *jeux d'esprit* ever published in Cambridge. In those days it was the fashion for College Dons to dabble in politics, and more than one of his Trinity friends made their fortune by their Liberal opinions. He did not imitate their example. He always described himself as "no politician." In 1818 he says decidedly that he does not approve of the Government (p. 43); in 1821 he opposed an address from the University against the Roman Catholics (p. 63); and in 1822 he voted against Mr. Banks for the same reason. But we never heard of his taking any decided line in those stormy days of the Reform Bill, when so many ancient friendships were destroyed; and latterly he abstained from politics altogether. His habitual exercise was riding, and he might be seen on most afternoons on his grey horse "Twilight," accompanied by his friend Dr. Worsley, still Master of Downing, either galloping across country, and "measuring the depth of every ditch in the county by falling into it" (as he said himself), or joining quieter parties along the road, whom he delighted by his anecdotes and brilliant talk. To this period belongs the famous story of the hunting of Lord Fitzwilliam's, the accuracy of which we tested by inquiry from Sebright, the veteran huntsman. His host said to him at breakfast, "We are all going out hunting; what would you like to do?" He answered, "I have never been out hunting, and I should like to go too." So he was mounted, and told to keep close to the huntsman. They had an unusually good run over a stiff country. At last, after clearing a formidable obstacle, the huntsman, who was leading, looked round to see what had become of the stranger. There he was, safe and sound, galloping along close behind him. "That, sir, was a rasper," said Sebright. "I did not observe that it was anything more than ordinary," replied the Don. So on they went, till at last his horse could go no further, and came to a dead stop, to the great indignation of Whewell, who exclaimed, "I thought that a hunter never stopped."

It is difficult to name any department of knowledge, any intellectual pursuit, any accomplishment even, at which he had not tried his hand with more than the usual success of such efforts at universality. Science was certainly his forte, but omniscience was with him more than a fable. A glance at his occupations between 1819 and 1841 gives convincing proof of this. In those twenty years he wrote a treatise on mechanics, which went through seven editions, each of which was almost rewritten; this was followed by a treatise on dynamics; he studied geology, and became President of the Geological Society in 1838; and Mineralogy, the chair of which he occupied from 1825 to 1832. He made experiments in Dolcoath Mine to ascertain the density of the earth; he studied the tides with great thoroughness and precision, and received a medal from the Royal Society in recognition of his labours; and, lastly, he wrote a *History of the Inductive Sciences*, in three bulky volumes, followed by "The Philosophy" of the same in two more, works which most men would have regarded as sufficient for a lifetime. Moreover, he studied ethics, and obtained the Professorship of what used to be known as "Casuistry," and now is called in Cambridge "Moral Theology," which he held from 1838 to 1855. It must be remembered that those were days of academic repose, before the endless meetings, born of Commissions, had begun; but still his College and University work must have taken up much time. In the above enumeration we have set down only his more solid works. In the intervals of his composition he studied French and German, in which he became a proficient, and made long tours abroad to cultivate the acquaintance of men of science; he wrote a clever book on architecture, in which he tried to prove that the pointed arch was derived from observation of the intersection of the barrel vaults of Romanesque work; he wrote reviews, papers in scientific journals, and pamphlets on University questions, of which that on the designs for the new library may be specially mentioned; he was one of the founders of the Philosophical Society, a regular attendant at its meetings, and a constant contributor to its Transactions; he preached before the University with such success that one of his oldest friends, Mr. Sheepshanks, advised him to be a candidate for a Professorship of Divinity; he tried to introduce hexameter verse into English literature by a spirited translation of Goethe's *Hermann and Dorothea*, and by addressing Mr.

Monckton Milnes (always a pet of his) as "Senator, poet, who long driven on in course Odyssean," and so forth; he cultivated music and drawing; he carried on a voluminous correspondence; and, lastly, he read every new book, no matter what the subject might be, that fell in his way. His memory was exceedingly retentive, and he helped it by taking notes and making abstracts of important works. He was, therefore, a most formidable antagonist in argument, and the consciousness of his own superiority to most persons with whom he came in contact made him self-willed and overbearing, as his friend Archdeacon Hare frequently deploras. With all this, however, strange as it may sound to those who remember him, he was in reality a modest man, anxious to obtain information from those better acquainted with a subject than himself. "I was always very ignorant," he writes to Hare in 1841 (p. 217), "and am now more and more oppressed by the consciousness of being so. To know much about many things is what I never aspired to, and certainly have not succeeded in." Here we may mention another pleasing trait in his character—his generosity. We do not merely refer to the numerous cases of distress which he alleviated, delicately and secretly, but to the magnanimity of temperament with which he treated those with whom he had been drawn into controversy, or whose wrong-doing he had been called upon to condemn. It is not too much to say that he never bore a grudge, or betrayed remembrance of a fault, or repeated a word of scandal. Moreover, there was nothing underhand about him. He would oppose a measure of which he disapproved, fairly and openly; but, when beaten, he cordially accepted the situation, and never alluded to the subject again.

In 1841, Sir Robert Peel being safely installed in office in place of Lord Melbourne, Dr. Wordsworth resigned the Mastership of Trinity, in order, as he expressly states in a letter to Professor Whewell, "that you may be, and will be, my successor." It was notorious that the Master's wish was to prevent the election of a Whig; and especially of either Dr. Peacock or Professor Sedgwick, both of whom were very popular with the Fellows. Dr. Whewell, therefore, entered upon his duties with the feeling of the College rather against him than with him. We now know how diffident he felt about his own fitness for the office, and how anxious he was to correct what he knew was defective in his character. In the same letter to Hare (p. 217) he says:—

In a person holding so eminent a station as mine will be, everything impatient and overbearing is of course quite out of place; and though it may cost me some effort, my conviction of this is so strong that I think it cannot easily lose its hold. As to my love of disputation, I do not deny that it has been a great amusement to me; but I find it to be so little of an amusement to others that I should have to lay down my logical cudgels for the sake of good manners alone.

In spite of these good resolutions, the first years of his Mastership were not a success. He was impatient, and he was overbearing, or at any rate, he was thought to be so, especially by those senior to him; and they abused him in no measured terms. The true explanation of much that was wrongly ascribed to mere arrogance is to be found in the lofty view that he took of the position and duties of the Master of his great College, and of the obligations laid upon him to exact from others the same precise observance of college rules that he imposed upon himself. This view once adopted he was far too conscientious not to put it into practice, regardless of the age and station of the person of whose conduct he disapproved. Hence he was erroneously regarded as a vexatious disciplinarian, even as an "imperious bully"—to quote a contemporary pamphlet—whose head had been turned by unexpected good fortune. A survival of this feeling exhibited itself years afterwards in one of the *mot*s that circulated after the publication of *The Plurality of Worlds*:—"Whewell thinks himself a fraction of the universe, and wishes the denominator to be as small as possible." Then came his Vice-Chancellorship, always a perilous year for a newly-elected and vigorous-minded Head. He tried to suppress disorders in the University by the same system that he had pursued in college; but his efforts only resulted in unpopularity. We well remember the degree-day of January 1843, when penny whistles sold for a shilling, so great was the demand for them, and the indignant undergraduates received the Vice-Chancellor with a concert the reverse of respectful. We have already mentioned the keen pleasure that he took in society. He had no sooner become Master than he threw open the Lodge, which had been closed during his predecessor's reign. "If a stranger comes to Cambridge, Trinity Lodge is the proper place for him to be entertained in," was his own expression of his hospitable intentions. He was not, however, as successful as a host as he wished to be. Unfortunately he had a bad memory for faces, and often gave unintentional offence by failing to recognize people. He used to say that "he liked to see a dinner in full cry"; and he certainly tried to promote that desirable end by vigorous personal efforts. In his hands, however, conversation was a monologue rather than a dialogue. He would select a subject, and handle it in a masterly fashion till he had had enough of it. But it was not in his vehement and impulsive nature to brook interruption, still less contradiction. A person who ventured to differ from him ran the risk of being crushed with "Sir, I perceive you do not understand the subject." His society, therefore, came to be dreaded rather than welcomed, especially in his own house. Again, he could never forget that he was Master, and insisted upon guests appearing in their gowns, as though they were fulfilling a college duty. At first even those who came to dinner came up to the drawing-room so habited, and were then asked to take them off; but subsequently this was given up, and academical vestments

were left in the hall. Those who came to an evening party, however, were obliged to wear them for the whole evening. It was a very uncomfortable rule, and it made the undergraduates more shy and awkward than they would otherwise have been. Then it came to be universally believed that it was his wish that no gentleman should sit down. We feel convinced that this was a mistake, but it was a mistake that was never corrected; and his parties made him more unpopular than his conduct in graver matters. Throughout his mastership he was respected and admired, but he was never loved.

It has been said that Whewell has not left his mark on the University. We beg leave to differ from this view. His philosophical and ethical systems may have been superseded; but not only have we got his scheme for the promotion of the study of international law, but we owe it to him that natural science has obtained its present hearty recognition. So early as 1823 he pleaded for the construction of scientific lecture-rooms and museums, and the establishment of the Moral Sciences and Natural Sciences Triposes in 1848 was in the main his work. It must not, however, be supposed that he was in any sense of the word a reformer. For a scheme to be approved by him, it must have been hammered on his own anvil. It was one of his mental defects that he could not put himself in the position of others, and see things as they saw them. He could hardly ever give his opponents credit for common honesty of purpose when they proposed to make any sweeping changes in institutions his admiration for which made him blind to their defects. Hence the language he used respecting the University Commissioners in 1855 (p. 439). Some one said to him, "I fear this is all very trying to you!" "Trying," he replied, "it is breaking my heart!" and to his wife he wrote that "disgust, grief, and hopelessness swallow up even indignation." Nor was the expression of his feelings limited to words. He treated one, at least, of the Commissioners with such coldness that, though he made every excuse that a generous man could make for the Master's conduct towards him, his last days were saddened by his old friend's estrangement. And when we remember that the four Commissioners whom he judged thus severely were Sir John Romilly, Dr. Peacock, Professor Sedgwick, and Sir J. F. W. Herschel, the most strenuous advocates of Dr. Whewell must admit that his conduct towards them ought to have been very different. The changes in the college statutes in 1857, and the discussions thereupon, gave him equal, if not greater, pain. Here, again, he could write of the conscientious effort of the junior Fellows to carry out what seemed to them important reforms:—"It is a very sad evening of my college life to have the college pulled in pieces and ruined by a set of schoolboys. . . . We have crazy work, as I think it." It is painful to have to record these blots in the character of a great man whom we sincerely respect; but no attempt to describe him would have been complete without some allusion to them. It was fortunate that he died when he did. The changes in college that appeared to him so revolutionary were trivial by comparison with those that have since been accepted by large majorities.

THE CHAPLAIN OF THE FLEET.*

THE latest novel of Messrs. Besant and Rice seems to us to be, in some respects, the best that they have as yet produced. The authors have deliberately set themselves in the writing of it a task of exceptional difficulty, and the success with which the task has been performed more than excuses the daring of the attempt. To paint accurately the manners of a past time is in itself difficult enough, and the difficulty is naturally increased when the narrative in which they are painted is supposed to be written by a person actually belonging to that time, whose whole attitude of mind is naturally different in many important regards from that of a later generation. To these difficulties yet a third is added, when, as in *The Chaplain of the Fleet*, this narrative is written by a woman, and in its nature involves a considerable knowledge of girlish character. These difficulties are, as we have said, overcome with signal success, and it may be fairly stated that the result is an exceptionally skilful *tour de force*, in which from beginning to end there is no appearance of effort. In a former story from the same hands, *Sweet Nelly, my Heart's Delight*, there was exhibited a remarkable capacity for assimilating not only the manners, but the way of looking at things, that belonged to a bygone age; but it is of course a greater strain to keep up an assumed character through three volumes than through one or one and a half. With some reason, perhaps, exception might be taken by a caviller to the title of the book, which is to a certain extent misleading, inasmuch as Chaplain of the Fleet is as much a definite title as is Chaplain-General of the Army. Now the Rev. Dr. Shovel has nothing whatever to do with the navy, and is, in fact, a Fleet Parson, or rather *the* Fleet Parson, since to others of the genus he is as a Triton is to minnows.

Kitty Pleydell is the daughter of the Rev. Lawrence Pleydell, who has died before the first chapter of the book begins, and has left for his daughter a characteristic letter, which makes the reader wish that he had been allowed to make acquaintance with Pleydell while he was yet alive. Of this the most important part for the purposes of the book's plot is an injunction to go to London, "and there seek out thy uncle and mother's brother, the Rev.

Gregory Shovel, Doctor of Divinity, of whom I have spoken to thee of old. I take shame to myself that I have not sent him, for many years, letters of brotherly friendship. Nor do I rightly remember where he is to be found. But I know that he lives, because once a year there comes to me a keg or anker of rum, which I know must be from him, and which I have drunk with my parishioners in a spirit of gratitude." Then follows the direction of a coffee-house where Dr. Shovel's address may probably be obtained, inasmuch as there "they know all the London clergy." Armed with this, and with the small legacy which comes to her, Kitty goes up to London, but before that comes to pass some important events have taken place. Sir Robert and Lady Levett, the great people of the parish, have been uniformly kind to Pleydell and to Kitty, and, indeed, Kitty has been practically brought up at the Hall since her mother's death. At the Hall there live Will Levett, Sir Robert's son, and Harry Temple, his cousin, and Sir Robert's ward. Both these youths are, in their different fashions, in love with Kitty, and both propose to her before she goes away. She, in a manner which is made by the narrative to appear perfectly natural, accepts both proposals without knowing it, and thus she starts in life with quite as much future trouble awaiting her as is fitting for a clever and pretty heroine. A proper escort is found to take her to London in the person of Mrs. Gambit, wife to one of Sir Robert's tenants, and the incidents of the journey are skilfully arranged so as to remind one, if any reminder were needed, of the characteristics of the time in which the story is laid. There is much talk on the way of highwaymen, and it was only long afterwards that Kitty learned that the old clergyman, whose paternal interest in her had been so marked as to alarm Mrs. Gambit, was, in fact, the notorious knight of the road, Black Will, in one of his many disguises. Arrived in London and at the coffee-house where they have been bidden to inquire for Dr. Shovel, Kitty and her duenna are much astonished at the more than lively interest displayed by the ragged parsons who fill the coffee-house when they learn that she is Dr. Shovel's niece, and this surprise is increased by the strange roads through which their coach takes them to Dr. Shovel's abode and the stranger scenes which take place as they near their goal. We have already revealed the fact that Dr. Shovel is a Fleet Parson, though no ordinary Fleet Parson, and we may now quote Kitty's description of the first impression which his presence made upon her:—

He was a very big and stout man—one of the biggest men I have ever seen. He was clad in a rich silk gown, flowing loosely and freely about him, white bands, clean and freshly starched, and a very full wig. He had the reddest face possible: it was of a deep crimson colour, tinged with purple, and the colour extended even to the ears, and the neck—so much of it as could be seen—was as crimson as the cheeks. He had a full nose, long and broad, a nose of great strength and very deep in colour; but his eyes, which were large, reminded me of that verse in the Psalms, wherein the divine poet speaks of those whose eyes swell out with fatness; his lips were gross and protruded; he had a large square forehead and a great amplitude of cheek. He was broad in the shoulders, deep-chested and portly—a man of great presence; when he stood upright he not only seemed almost to touch the ceiling, but also to fill up the breadth of the room. My heart sank as I looked at him; for he was not the manner of man I expected, and I was afraid. Where were the outward signs and tokens of that piety which my father had led me to expect in my uncle? I had looked for a gentle scholar, a grave and thoughtful bearing. But, even to my inexperienced eyes, the confident carriage of the doctor appeared braggart: the roll of his eyes when we entered the room could not be taken even by a simple country girl for the grave contemplation of a humble and fervent Christian: the smell of the room was inconsistent with the thought of religious meditation; there were no books or papers, or any other outward signs of scholarship; and even the presence of the Prayer-book on the table, with the hassocks, seemed a mockery of sacred things.

The Doctor's clerk has brought Kitty in, taking her to be one of the Fleet parson's clients, and it is some little time before the mistake is cleared up. When this has been done, the Doctor proceeds to deliver an admirable oration in defence of his disreputable calling, and after that he takes counsel with himself as to where to bestow his niece. Before this is arranged, she has an opportunity of witnessing the performance of a batch of Fleet marriages, a ceremony which is described with a great deal of vigour and humour. Here, as elsewhere, it is artfully contrived that, in spite of the Chaplain of the Fleet's degradation, one cannot but regard him with a certain amount of admiration, if not of respect, for his complete command over his fellow-men, and, within certain limits, over himself. He is in the habit of presiding in the evenings at convivial meetings frequented by the dwellers in the Rules of the Fleet; and the fame of his gifts in speech and story has spread so far that young bloods not infrequently attend these meetings for the express purpose of seeing him. One such, Lord Chudleigh, comes to such a meeting on a fateful evening. The Chaplain of the Fleet has his own reasons, which we need not reveal, for hating any one who bears the name of Chudleigh, and he takes what he thinks a terrible revenge upon the son of the man who has injured him. He beguiles him, with all the other guests, into drunkenness, places him in his own bed, wakes him early the next morning before the fumes of the liquor have disappeared, and makes him go through all the forms of a binding marriage with Kitty, whose face even he is not permitted to see for a minute. Kitty, it should be said, is compelled into an act which might otherwise seem unworthy of her by the overmastering force of her uncle's will. Here it will be seen is a pretty complication to begin with. The heroine is, without knowing it, engaged to two young men, and married to another, who has no idea who she is.

* *The Chaplain of the Fleet*. A Novel. By Walter Besant and James Rice. 3 vols. London: Chatto & Windus. 1881.

Now comes a change in the circumstances of the heroine and of her friend, Miss Pimpernel, in whose care the Doctor has placed her, and who has hitherto been an inmate of the Rules of the Fleet. Miss Pimpernel comes into some money, and the two go off together to Epsom Wells. Just at the period of the story the glory of this watering-place (in the old sense of the word) had revived for a few years. There were concerts, balls, assemblies, breakfasts, and although there appears to have been no actual Master of the Ceremonies, the frequenters of the place had deliberately adopted the rules of Beau Nash, which involved amongst other things a prohibition of the wearing of swords by any visitors at the Wells. To the Wells, the life at which is described with signal brightness and accuracy, comes presently Lord Chudleigh, who finds Kitty established as the belle of the place, and who is introduced to her as a stranger. They fall in love with each other, as is only proper and to be expected, but Kitty's is a fearful joy, since she naturally dreads her dear lord's discovery that she has been a party in the disgraceful plot of her uncle against his peace of mind. On his side he is tormented by the consciousness that, married to who he knows not what poor wretch, he has no right to give expression to his love for Kitty. The situation is, of course, to a certain extent saved by her complete knowledge of facts, with which he has only an acquaintance, the very vagueness of which carries terror with it. Out of several pretty love scenes which arise from this complication we choose for quotation part of one in which the double difficulty is apparent to the reader:—

"You know," he said, "that I love you, Kitty. You have known that for some time—have you not?"

"Yes, my lord," I replied, humbly; "I have known it, and have felt my own unworthiness. Oh, so unworthy, so unworthy am I that I have wept tears of shame."

"Nay—nay," he said. "It is I who am unworthy. My dear, there is nothing you could tell me which would make me love you less."

I shook my head. There was one thing which I had to tell. Could any man be found to forgive that?

"I came back here resolved to tell you all. If I could not ask for your love, Kitty, I might, at the very least, win your pity."

"What have you to tell me, my lord?"

It was well that the night was so dark that my face could not be seen. Oh, tall-tale cheeks, aglow with fear and joy!

"What have you to tell me?" I repeated.

"It is a story which I trust to your eyes alone," he said. "I have written it down. Before we part to-night I will give it to you. Come"—he took my hand again, but his was cold—"come, we must not stay longer. Let me lead you from this slippery and dangerous place."

"One moment"—I would have lingered there all night to listen to the accents of his dear voice. "If you, my lord, have a secret to tell to me, I also have one to tell you."

"Nay," he replied. "I can hear none of your pretty secrets. My peace is already destroyed. Besides," he added desperately, "when you have read what I have written you will see that it would be idle to waste another thought upon me."

"I will read it," I said, "to-night. But, my lord, on one promise."

"And that is?"

"That you will not leave Epsom without my knowledge. Let me speak with you once more after I have read it, if it is only to weep with you and to say farewell."

"I promise."

"And—oh, my lord! if I may say it—since your lordship may not marry me, then I, for your sake, will never marry any other man."

"Kitty!"

"That is my promise, my lord. And perhaps—sometimes—you will give a thought to your poor—fond Kitty."

He caught me in his arms and showered kisses upon my cheeks and lips, calling me his angel and a thousand other names, until I gently pushed him from me and begged him to take me back to the company. He knelt at my feet and took my hand in his, holding it in silence. I knew that he was praying for the blessing of Heaven upon my unworthy head.

These things being so, the course of Lord Chudleigh's and Kitty's loves cannot, of course, run smooth; but beyond this difficulty there are interferences caused by the spite of a rival beauty, whose character is sketched with a firm and light hand, and in the appearance at the Wells of Harry Temple and Will Levett, each of whom regards Kitty as his promised bride. Harry is the easier to manage of the two, although even in his case Kitty has to employ a clever and somewhat cruel stratagem to rid herself of his importunities. Will turns out, as might have been guessed from his boyhood's pranks, to be a dull ruffian, who, accustomed to adulation from everybody in his own small village, attempts to lord it over every one at the Wells, and for a time succeeds, in consequence of the disinclination of well-bred gentlemen, who are not allowed to wear swords, to engage in a street brawl with an offensive person brandishing an oaken cudgel. Finally, two or three of the leading visitors agree to break the usual rule and confront Will with a threat of cold steel, which effectually quells him so far as the observance of public order is concerned, but which has no effect upon his obstinate determination to make Kitty his wife. There is a thrilling scene consequently of a forcible elopement and a rescue, and at last the unhappy Kitty is freed from the persecutions of the two lovers whose claim to her hand has in the first instance fallen upon her like a thunderbolt. There remains the greatest difficulty of all, and the solution of this readers may find out for themselves. We have purposely given the merest sketch of a novel which, as it seems to us, is not only full of invention, but is charged with a curious knowledge both of the spirit and of the details of the life with which it deals. The minor characters, among whom we may specially mention Solomon Stallabras and Sir Miles Lackington, are capitally drawn; and it is safe to say that the book is full of interest from beginning to end. Of its interest in another way, as an unusual feat of literary skill, we have already spoken.

PROCTOR'S POETRY OF ASTRONOMY.*

OF all the sciences, astronomy has immemorably been felt to be the one most fitted to kindle the poetic imagination. In heavenly space there is an absolutely boundless sphere wherein the intellect may expand and the fancy may wing its flight. The mystery of the stellar depths, the mazes of the shining orbs, the stupendous cycles which science has assigned to their paths in space, and to their history for aeons past and to come, have been to poets a perennial fount of inspiration, an exhaustless store of trope and figure. From our growing familiarity with celestial objects, and the exactitude of modern processes of calculation, measurement, and analysis, there might be bred, it was to be feared, a chilling of the imaginative fire, a contempt for the simple moods of awe and wonder with which the heavenly bodies were wont to be looked up to as diviner far than anything of earthly mould. Yet against this materializing effect of the *Zeitgeist*, it may be pleaded, we are disposed to think, that the fuller and more definite knowledge of later years has given, in some important respects, fresh incentives and additional scope to the imaginative powers. In the newest born of the special sciences, for instance—the department of solar physics—is it not conceivable that fresh fuel may be found for the poetic fire which, on the traditional embers of sun, moon, and stars, had come to burn unmistakably low? So at least thinks Mr. Proctor, who would on no account have the triumphs won by our gigantic lenses and subtler prisms unhonoured and unsung:—

Carent quia vate sacro.

The scientific spirit is beyond doubt closely akin to and largely vivified by the spirit of poetry. The intellectual instinct or effort which pierces into the mysteries or abysses of nature, or gives form, unity, and harmony to the structure of the universe, differs little but in form from that whereby the poet frames his ideal world. The true man of science is a seer, a creator by right of his revelation of new aspects of nature. In the purest and most abstract of the sciences—the mathematics—the imaginative faculty has most signally made good its claim, having in our own time, in its inspiration of such men as Gauss, Sylvester, Cayley, and Clifford, created for itself additional spheres and subtler methods, with lights for the fancy into novel realms of space. Of music, considered as a science no less than an art, the same law of the mind holds good. And in the less ethereal world of physics there is, in a degree, abundant play for the same faculty. "No one who studies aright the teachings of the profoundest students of nature will fail to perceive that our Galileos, Keplers, and Newtons, our Priestleys, Faradays, and Tyndalls, have been moved in no small degree by poetic instincts, and that their best scientific work has owed as much to their imagination as to their reasoning and perceptive faculties." Thus writes Mr. Proctor in the preface to his recent volume on the *Poetry of Astronomy*; and he proceeds to make good and illustrate the lesson in a series of a dozen essays upon various astronomical subjects, "regarding the heavenly bodies less in their scientific aspect than as suggesting thoughts respecting infinities of time and space, of variety, of vitality, and of development." His aim is not so much to draw out in didactic form the dry facts and systematic teachings of modern science as to impress the mind of his readers with the glory and splendour of the universe. He takes for granted so general an acquaintance with the most advanced of astronomical theories or observations as may permit him to dispense with the preliminary proofs, passing on from admitted and isolated facts to the ulterior relations they bear to each other or to the universe at large, or the consequences to be looked for from their prolonged operation as causes of cosmical change. The prophetic vein may thus be said to mingle largely with that of poetry, widening its scope and intensifying its spirit. The infinite range of the astronomer's intellectual vision, together with the certainty of his methods of calculation, leading features of contemporary science, will be found a powerful motive to strike the poetic imagination. In the wonderful development of solar physics, which has given its special character to the astronomic science of the last twenty years or so, we see themes of contemplation opened up in which sober fact almost perforce assumes the garb of fancy. The glowing hues and subtle threads or bands which the sun's disk exhibits in the field of the spectroscope are not more fraught with beauty and variety than are the speculations (as yet hardly more than fanciful) as to the causes that lie behind these strange and fascinating phenomena, the forces they faintly reveal at work, or the ranges of time and space involved in their operation. And what is the utmost emission of solar light and heat compared with the infinite shining and incandescence of the multitudinous stars, but as the energy of one unit amongst hundreds of millions? Or look at the most recent mystery, which, but for its temporary darkening by the moon's limb under eclipse, the solar orb would never have revealed to our view, the rose-tinted streams, probably of blazing hydrogen, that are seen starting forth from the interior and reaching for hundreds of thousands of miles into the glowing corona. What forces are here at work! What volumes of matter are here massed together, or whirled about in storms or vortices which it transcends our utmost imagination to measure! And yet, if anything is certain in this science of paradoxes, it is that the elementary substances which combine in these tremendous volumes and glow with this

* *The Poetry of Astronomy: a Series of Familiar Essays on the Heavenly Bodies, &c.* By Richard A. Proctor, Author of "The Borderland of Science," &c. London: Smith, Elder, & Co. 1881.

incalculable degree of incandescence are none other than those familiar to us on the surface of our own earth. The vapours of iron, copper, and lead are present in enormous, whilst ever varying, quantities in that fiery atmosphere, just as in our own aerial envelope the vapour of water is always present, though not always to the same extent. Flowing hydrogen is there as a fixed constituent, just as oxygen and nitrogen are fixed constituents of our own air. The recent announcement of oxygen having been detected in the solar spectrum has not been verified by observation of the bright lines we had been led to expect during the late eclipse. The stupendous distance to which the luminous corona (now plausibly identified with the zodiacal light) is calculated to extend, the sun's visible disk forming but a trifling nucleus within this mighty sphere, is something to appal the powers of calculation. And yet from the centre to the circumference of this prodigious mass tremors like auroral streams are seen to run in intervals so short as to astound us with the velocity of transmitted vibration. If an undevout astronomer is mad, must not a solar physicist with no poetry in his soul be deemed a monster? To give fitting language to the thoughts which studies so entrancing should kindle in him may, indeed, not be the strong point of the sensitive man of science. Nor can we say in candour that Mr. Proctor shows quite the power to utter the poetic thoughts that arise in him. As Mr. Browning has allowed in his own instance, he neglects or lacks the form. Of the fineness of his ear we may to some extent judge from his selecting for quotation a specimen of rhyme so exquisite as

expanse of liquid, pure,
Transparent, elemental air.

In the topics touched upon by our author there is an intrinsic grandeur, an occasional mystery, or a suggestion even of terror, likely enough to thrill any poetic fibre that may exist in the reader's temperament, the writer having all the while, unknown it may be to himself, been talking prose of the most bald and commonplace kind. We have scientific men who, in writing or speaking, throw without an effort a glow of poetry over all they have to tell of nature and her marvels; but we sadly miss this charm in Mr. Proctor, even when he has for his theme the heavens, with all their glory and beauty. There is much matter of interest in "The Sun in his Glory," one of his opening discourses, in which he sums up the most important gains to our knowledge of solar physics within the last twenty years, due chiefly to the revelations of the spectroscope. We might, however, complain of the tone conspicuous throughout these representations, as fitted more to set the audience agape with wonder, like a mob on a firework night, than to leave their souls aglow with poetic fervour. The sun's heat may be equalled to that given out by the consumption of 11,800 millions of tons of coal in a second of time; the feeble pull of his mass at our distance may be set against the might of a child's arm; 350 millions of years may be assigned for the cooling of the earth from 2000° Centigrade to the heat of boiling-water, as, later on in the book, the probability of the uniform direction of the 175 known asteroids in their orbits round the sun having been due to chance is set down in decillions; but how far, we would ask, is the average student to be enlightened or edified, still less kindled to poetic musings, by piles of figures such as these? Nor is Mr. Proctor at all times so careful as he should be of exactitude in the facts upon which his structure of paradox is to be built up. "When the Sea was Young" is one of the most thrilling themes to which he strikes the poetic lyre. His thoughts fly back to mists or abysses of time in which the genius of Milton might easily be lost. For "of all things terrestrial," he premises, "the ocean is at once the most ancient, and the one which will endure the longest." Mountains and hills have from time immemorial been taken as emblems of the everlasting. The Bible speaks of the "everlasting hills." But, in reality, Mr. Proctor reminds us, the mountains are young compared with the ocean. Habakkuk and the Psalmist were not so true to nature as Byron:—

Time writes no wrinkle on thine azure brow,
Such as creation's dawn beheld thou rollest now.

To the unimaginative reader it might occur that before the ocean was precipitated there must have been a bed to hold it; and, however strong may be the proofs of the mass of watery vapour having been held in suspension and forming an envelope of mist or cloud around our globe, analogous, it may be thought, to the present condition of Jupiter, must not the crust of the earth have made vast advances from the intermediate seething molten mass that followed upon the original state of incandescent nebulous vapour, so that not a few of the now existent products of the earth's cooling (many forms of crystal, for example) had assumed their solid shape? Looking, on the other hand, to the strong conviction of many geologists, supported by Mr. Proctor himself elsewhere, that our ocean, like that once possessed, it is thought, by the moon, is destined to be withdrawn by fissures and clefts into the interior of the planet, a full third of its volume having, according to some, been already so absorbed, how can it be said that the ocean is to endure beyond all things terrestrial? Before soaring upon the wings of poetic or prophetic rapture, it were well to make sure of having solid ground under the feet. Mr. Proctor shows at times his lighter moods. He has his *allegro* as he has his *penseroso*. After exciting our fears by entitling a chapter "Living in Dread and Terror," he conjures up for us what he calls a world of vagaries, taking us for a round of hypothetical visits to other planets than the earth, pleasing our fancy with what would be the effect of such change of physical surroundings. This is somewhat like looking at ourselves now inside now outside of a spoon; at

one minute all length, at another all breadth. On Jupiter we are flattened like pancakes; on Mercury we hop, skip, and jump over the highest mountains. Suppose we alight on one of the newly-discovered moons of Mars, proposed to be named Deimus and Phobus, not more than twenty miles in diameter. The high jump of a fair athlete would be half a mile, and the long leap after a run of nine Martian miles would be $2\frac{1}{2}$ miles, or a sixth part of his world's diameter, tantamount to the whole way from England to India, or from Scotland, over the North Pole, to Behring's Straits.

Applying this reasoning to either of the moons of Mars whose gravity we have assumed equal to a six-hundredth only of terrestrial gravity, we arrive at the stupendous—the appalling—result, that men there might be six hundred times as tall as terrestrial men, yet equally active. The same reasoning applies to animals, and the idea of an elephant or a giraffe six hundred times as tall as terrestrial specimens of these animals is dreadful indeed. But let us content ourselves with considering human beings only. The Broddingnags of Swift sink into utter insignificance beside giants 1,200 yards high. The average height of a Broddingnag was about 20 yards, or ten times the height of ordinary men. So that the inhabitants of a Martian moon, on the assumption we have been dealing with, would exceed a Broddingnag sixty times in height, or six times more than a Broddingnag exceeded Gulliver, or than Gulliver exceeded the King of Lilliput in height. Amongst the Martian lunarians a Broddingnag would be almost as utterly insignificant as a Lilliputian among Broddingnags.

Keeping in mind, however, the vastly less volume and the consequently excessive rarity of the air on this tiny globe, its entire atmosphere being, he calculates, only one 64-millionth part of our own, Mr. Proctor goes on sagely to reflect, not only that any visitant from the earth would sink at once for want of breath, but that such people as may be conceived to inhabit the Martian moon would find their vital energy so reduced that, instead of being able to leap half a mile high or two or three miles on the flat, they are to be imagined not a whit more active than we are with our weight six hundred fold greater, but with a far more effective respiration. Need it be said that the known uniformity of nature may be trusted to adjust whatever forms life may assume to its external conditions or surroundings, wheresoever in the universe its lot may be cast? Of what kind of use or interest can be speculations as to the building materials or processes requisite in a world where a block of platinum would press downwards with less force than a block of deal one-twentieth of its size on our earth? A Krupp cannon, whose range here is five miles or so, would leave such a diminutive moon for ever, its recoil carrying the cannon half-a-dozen miles away from the firing point, or wellnigh halfway round the insignificant sphere. A walker as good as Weston could easily keep up with the sun, and practically put an end to time. As we are put through all the whimsical puzzles which Mr. Proctor's fancy conjures up, we are reminded of such familiar conundrums of our childhood as "How many cow's tails would reach the moon?" Are his modern instances, after all, much wiser than the old saw that, if the sky were to fall, larks would be cheap? There may be groundlings whose ears may be tickled by such tricks as he chooses to play before high heaven; but it is by no means clear to us that the interests of science or the edification of the reader are promoted by writing in such a vein as this.

THE FIRST OF MAY.*

THE fortunes of illustrated books are hard. They are also known as "table-books," because they are laid on tables, especially drawing-room tables. To lie on tables is their end and mission. Occasionally they are opened and turned over by unfortunate persons, too shy or too dull to talk, who hide their *ennui* and confusion of face among the pages of illustrated volumes. If they escape this doom, *livres de luxe* find themselves shut away in the cabinet of the amateur, who does not look at them once in a score of years. And yet there is obviously a demand for tomes whose fate is thus unenviable, for volumes which are the "wall-flowers," or the veiled recluses, of the world of books. We imagine that rich but honest people buy treasures of this sort, partly by way of having a taste, partly to give them away as Christmas or wedding presents. It is a peculiarity of human nature to purchase and give away things that no one would purchase to keep. Hence comes the market for ormolu, for the dreadful vagaries of modern pottery and porcelain, and for large decorative books. The artist who decorates such volumes has, at least, the comfort of thinking that his designs are occasionally glanced at, by persons who cannot converse, or are in want of an opening for conversation. But the author, the provider of the "letterpress," as it is contemptuously called, knows that no one will ever read his prose or verse. His composition is a mere peg to hang pictures on, and his share, on the whole, is next to nothing.

In spite of these obvious considerations, Mr. Walter Crane and his anonymous associate "have done their level best" to make *The First of May* a pretty collection of verses and designs. Mr. Crane's skill and fancy as a designer of illustrations for picture-books are well known. His fanciful talent ought to be at home in Fairyland, and, as we shall see, many of his designs are extremely graceful and captivating. Much depends, of course, on the sort of Fairyland which Mr. Crane is expected to illustrate. His fairies are not the somewhat stern and tragical beings of the old Scotch poetry. They are not mere semblances, hollow behind

* *The First of May: a Fairy Masque.* By Walter Crane. London: Sotheran & Co. 1881.

(though a few of Mr. Crane's female figures rather suggest this ancient superstition), nor is their gaiety subdued by the thought that every seven years they "owe the kame to Hell." They do not carry off knights and seers, like Tamlane and Thomas of Ercildoune, and their country is not begirt by the woful flood:—

For a' the bluid that's shed on earth
Runs in the streams of this countrie.

Mr. Crane's fairies, like those of Shakspeare, are interested in mortal lovers. But, unlike Oberon, Puck, and Titania, they are extremely moral, æsthetic, and instructive. There are also bad fairies, who attempt to interfere with the work of the good ones. Perhaps the most ingenious of Mr. Crane's drawings are the pair which represent the rival powers at work. Good little elves are building nests, carrying flower bells in yokes, like milkpails, on their shoulders, letting birds out of cages, and in every way forwarding the work of spring. Bad little elves are cankering and blighting flowers and fruits, and associating with wicked beings in all the more hideous reptile shapes. The good says are the subjects of Angelica, Queen of the Fairies. Her chief adviser is Robinet, chief fairy verdurer of Rosedale Forest, whose duties answer to those of the Duke of Cambridge in Hyde Park. But Robinet is an extraordinarily moral and æsthetic sprite. He talks like the Slade Professor of Fine Art and the preacher at St. Mary's for the week rolled into one. Thus he is quite capable of lecturing about the "torso of an oak," and when he wants to praise that sweet *rousère*, Lillian, the mortal May queen, he says—

Sweet manners has she, gentle courtesy,
Which far transcend her lips, and eyes, and hair,
As the high vasa! Colour Form transcends.

This may mean either that virtue and gentleness are to eyes and hair as Form to Colour, or as Colour to Form; probably the earlier statement of the equation is that intended by the poet. Even the wicked elves speak about their "worse self" as if they were writing didactic essays in the *Nineteenth Century*. There are various other fairies, with prettier names than Herrick gave them—Mellot, Speedwell, Daffodil—and so on. Lillian, the Queen of the May, has a mortal lover, Laureo. On the other side are her Fairy Majesty's Opposition. We have Mandrake, the leader, Adderstongue, Canker, and Toadstool, his associates, and Marjoy, who is dressed as a clergyman. This is rather hard on the clergy. It was the Dissenters rather than the Church who anticipated Marjoy in his attacks on the wickedness of May-day sports. The *Pervigilium Veneris*, Mr. Crane and his poet may be reminded, though picturesque and doubtless extremely jolly, was the very reverse of a moral entertainment. Angelica would have put it down, and Robinet would have rebuked it in his very best blank verse. As to Marjoy, he is the enemy of the modern survival of May-day in its pretty rustic shape. One need not be a Marjoy to pity the miserable, blue-nosed, bedizened children who beg for coppers on May-day in London. But, perhaps, there are still idyllic villages where the rites are prettily managed, and then we scarcely suppose Marjoy would wear the exaggerated dress of a clergyman of the Church of England.

The plot of the Fairy Masque is extremely simple. Mandrake and his company try to ruin the May and the love affair. The spring is saved and the lovers reconciled by Robinet, Angelica, and the good fairies generally. In fairness to Mr. Crane's poet (whose verses have been very neatly copied by the artist, and surrounded with scrolls of flowers and forms of flying birds), we give some examples both of the blank verse and the lyrics. Here are Lillian's remarks on the dawning of the 1st of May:—

Ne'er broke such morning on the First of May!
It came as comes some palmer cross the hills,
Who in his hand a budding palm-branch bears,
Which as he bears, touched with the breath of spring,
Quick into silver buds and blossoms breaks,
Then quick from silver turns to flossy gold,
'Then quick from gold spreads into whitest down,
So broke the morning o'er a thousand hills.

The last line is pretty, in the others a slight want either of experience or of native gift for blank verse may perhaps be detected by the critical ear. As a specimen of the lyrics (in which, by the way, "dawn" should not rhyme to "born") we take the Songs of the Elves:—

THIRD ELF.

Swallow, me the ocean o'er
Silver-breasted courser bore;
Where the sun went there went we,
Made four seasons Graces three.

FOURTH ELF.

In squirrel's store-house crept,
Cracked his filberts while he slept;
Sang and danced as came the whim,
Then with nutshells pelted him.

FIFTH ELF.

First I lodged with brown field-mouse,
Crushed my wings, so small his house;
So I went to humble-bee,
Honeycomb and mead gave me.

Here the obscurity of sense in the Third Elf's song is the result either of careless or inexperienced writing. "Made four seasons Graces three" may imply that four seasons made three Graces (which is nonsense), or that three Graces made four seasons, which has no particular sense. In the last line of the Fifth Elf's song we propose to read, *ex conjectura nostra*, "honey-

comb and mead gave *he*," which at least provides a nominative to gave.

Turning from the verse to Mr. Crane's drawings, we fear that a threadbare criticism must be repeated. His combinations of elfish shapes and fantastic beasts and flowers and birds are as admirable as ever. But his drawing of the figure, as usual, leaves much to be desired. His undraped women are too often like attenuated men; they suffer from flatness and scragginess. In Plate XXXI. the body of the warrior seems much too heavy for his spindle-shanks of legs. Plate XLIII., on the other hand, is exceedingly pretty; and so is poor deserted Lillian in the Fiftieth Plate. The figure of Laureo, the lover, is always stiff and constrained, and all the passion of the affair is obviously on the side of Lillian. The drawings are "photo-engraved" by Messrs. Goupil, and are certainly fine reproductions of the originals, which lately were—perhaps still are—being exhibited in a gallery in Bond Street. To be just to Mr. Crane's fairies one should compare them with those of Cruikshank and of Mr. Richard Doyle, in his really delightful Christmas book. The fairies of the two latter artists, who vary so much in almost everything else, were full of life, malice, fun, and mockery. Mr. Crane's seem, in their faint attenuated grace, rather like the feeble ghosts of classical *hôttes mystérieux de la forêt* than jolly English pixies. Angelica, especially in the reconciliation scene, where she stands undraped joining the hands of the lovers, is rather like a Venus of Mr. Burne-Jones than a fairy queen. She has the air of a converted goddess of the hollow hill, no longer amorous of wandering knights, but anxious to live as respectable a life as is consistent with classical theories of drapery. In his two rustic figures, and in the burly priest Marjoy, Mr. Crane makes a creditable effort to escape from his own extreme refinement.

COLLECTED WORKS OF DR. SIBSON.*

THE late Dr. Sibson was a man of marked individuality of character. Those who knew him personally will not easily forget his frank, genial manner, and the abounding energy he was wont to display in the conduct of any investigations or affairs with which he was at the time engaged. In the present volumes are embodied the results, not of all, but of more than a representative portion of, his labours in the furtherance of medical knowledge. His great illustrated work on "Medical Anatomy," to which he devoted the loving and arduous labours of many years, is not reproduced, nor are certain minor and more or less incomplete productions. With these exceptions the present volumes contain the whole of the important contributions made by Dr. Sibson to the professional knowledge of his day.

The papers and memoirs are prefaced by a brief account of Dr. Sibson's life from the pen of the editor. From it we learn that Sibson was born at Cross Canonby, in 1814, and received his education in Edinburgh. At the early age of fourteen, when commencing the study of medicine, he was apprenticed to the distinguished anatomist Professor Lizars; and only a few months after the completion of his seventeenth year he obtained his diploma from the Royal College of Surgeons of Edinburgh. In those days such a thing was possible, though now the aspirants for this or for similar distinctions in any of the medical corporations throughout the United Kingdom are happily compelled to produce evidence that they have attained riper years. In Sibson's case, however, the cessation of his nominal student's life was but the beginning of a new studentship upon a wider and more untrammelled basis. He continued, in fact, throughout his whole career, to be an eager and zealous student. Dr. Ord says:—

The years 1831 and 1832 saw the first outbreak of cholera in this country. Sibson, with the courage and thirst for investigation which marked his whole life, at once volunteered to serve in the cholera hospitals. He was thus employed first at Leith and Newhaven, afterwards in Edinburgh. Contemporary letters speak in warm terms of his attention and thoroughness in the treatment of the victims of this terrible epidemic, doubly terrible then by reason of its novelty and strangeness.

After studying pathology for a time in London, in the year 1835 Sibson obtained the appointment of "Resident Surgeon and Apothecary to the Nottingham General Hospital." This post he continued to hold for thirteen years, and during the whole of the time, apart from the more duties of his office, which were sufficiently arduous to a nature like his, he "threw himself with ardour into the path of independent observation and research." In the year 1844 was published his first important paper, "On Changes induced in the Situation and Structure of the Internal Organs, under varying circumstances of Health and Disease." This memoir at once brought him a high reputation. Two years later he published an elaborate paper on "The Mechanism of Respiration" in the *Philosophical Transactions*, and during the next two years this was followed by a series of papers on cognate subjects. Then, acting upon the advice of certain friends, though greatly to the regret of members of the medical profession at Nottingham, Sibson determined to leave the province, and enter as a physician upon the wider sphere of London life and practice. This involved the taking of a medical degree and the passing of other examinations as necessary preliminary steps. On leaving the town of Nottingham "a handsome testimonial was presented to him, but who the donors were was always kept a profound

* *Collected Works of Francis Sibson, M.D.* Edited by Dr. Ord. 4 vols. With illustrations. London: Macmillan & Co. 1881.

secret. The amount, however, was such as to render his early residence in London free from anxiety." Thus, at the age of thirty-four, Sibson again for a brief period resumed ordinary student life, and set himself with all the energy of his nature to obtain the particular medical diplomas which required the hardest work and were the most esteemed. Within the year 1848 he graduated successively as Bachelor and Doctor of Medicine in the University of London, obtaining honours at each examination. In the following year he became a member of the Royal College of Physicians, and, on account of his scientific work, was also elected a Fellow of the Royal Society. When, two years later, St. Mary's Hospital was opened, Dr. Sibson was appointed one of its first physicians, and later, on the establishment of a Medical School in connexion with the Hospital, he became one of its lecturers on medicine. Here, during a period of twenty years, he was at once a zealous physician and an enthusiastic teacher as well as student. During eighteen of these years he patiently and laboriously gathered the material for, and superintended, the execution of the plates for his great work on "Medical Anatomy," which was published in 1869. Two years after his appointment to St. Mary's Hospital, Dr. Sibson was elected a Fellow of the Royal College of Physicians, and in the following year he delivered the Goulstonian Lectures. Then his life became one of full and varied activity. As the editor of his works says:—

From this point onwards we find him filling a great part in the medical life of London, in relations so various and so important, in lines so individually distinct, that a chronological record of his doings for each successive year would give only a confused idea of what he was about. His studies went on unceasingly at home and in the hospital, in moments snatched from the busy day, in hours yielded from what should have been given to the night's rest; while outside, in the world, he was in active practice and making his energy and strength felt in public life.

The volumes before us contain twenty-six papers, which have been selected either on account of their "individual completeness," or from the fact of their containing "distinctly original matter." They are arranged broadly in two groups; the first comprehending papers relating to the physiology of respiration, and the natural history and diagnosis of diseases of the lungs and heart; the second, papers relating to the physiological action and therapeutic use of certain narcotic poisons.

Dr. Sibson's labours were, in fact, in the main devoted to such studies as were calculated to improve our knowledge, and, above all, our power of accurately diagnosing thoracic diseases. He strove with all his might to broaden and make sure the foundations upon which the physician has to rely in building up a clinical experience which shall make him competent to recognize the ever-varying phenomena presented by thoracic diseases in individual cases. There can be no doubt that one of the earliest of Sibson's papers, that which has been before referred to as at once winning for him a distinct reputation, is a contribution of considerable value even at the present day, and is well worthy of being reproduced from the pages of the provincial journal in which it was originally published. It might, however, have been made more useful than it is had the editor chosen to add to it some classified table of contents, in order to facilitate reference to the different groups of facts with which it is concerned. Nor, had Dr. Ord expended so much of extra care upon the work, could he have incurred any of that kind of blame which he is so particularly anxious to avoid. It seems rather an empty and questionable kind of pretext when the editor seeks to excuse very distinct repetitions in several papers, of both groups, by merely writing as follows:—"Readers who may find a little weariness in some of the recapitulations will perhaps pardon the Editor, whose reverence has forbidden him to blot out any word of the author's writing." Yet it is scarcely to be supposed that even Dr. Ord imagines these writings of Dr. Sibson to be up to the level of those of a Harvey or of a Sydenham, much more of an author from whose writings no word ought to be blotted out. In truth, some of the papers included in these volumes are far from having any very conspicuous merit; and others of them, though they were undoubtedly interesting contributions to the knowledge of the time at the date of their publication, are now, after the rapid growth of scientific information in the interval, not likely to be looked into with more than a languid curiosity. This applies, for instance, to the paper entitled "Remarks on the Fever of Nottingham and the neighbourhood that prevailed in the summer and autumn of 1846," which was written at a time when our knowledge as to the real distinctions existing between typhoid and typhus fevers was still in its infancy; before, in fact, the masterly contributions of Sir William Jenner to this subject were published. Another of these early papers, however, that on the causes and mode of "Death from Chloroform," though published in 1848, is a valuable communication which contains conclusions and cautions that are still quite harmonious with, and even fully representative of, our present knowledge on this subject. Sibson said:—"We are obliged, then, from the experience of these cases to conclude that in man the death is usually instantaneous, and due, as every instantaneous death is, to paralysis of the heart. In animals the death is usually due to paralysis of the muscles of respiration." The experience of subsequent years has also confirmed the fact that death is most apt to occur during the use of this anæsthetic in trivial cases, and has thus fully justified Sibson's conclusion, expressed more than twenty years ago that "In dental surgery (except in extreme cases) and in trivial operations, the use of chloroform is not justifiable." Had this view been generally adopted earlier, to the

same extent that it is at the present day, the total number of deaths from chloroform would have been appreciably smaller.

One and a half of the four volumes are occupied by a series of papers which were published in Reynolds's *System of Medicine* only a very few years ago, and it cannot be said that there was any particular need for their reproduction in their present form. In all probability these papers will still be seen and consulted principally where they were originally published.

One of the last papers reproduced in this work, and almost the last published by Dr. Sibson, is an "Address in Medicine," which he delivered before the British Medical Association in 1873, mainly on the subject of the advantages of "rest and ease" in the treatment of acute rheumatism and acute gout. The address was able, thoughtful, and based upon much careful observation. By it we are reminded of one of the real advances which has been lately made, even since the period of Sibson's death, on the therapeutic side of medical science. Rheumatic fever had long been regarded as one of the most intractable of the diseases with which the physician has to deal, and by way of comment upon the comparative inutility of the most various modes of drug treatment, Dr. Sibson occasionally said that "six weeks and a blanket" was the only known antidote for this common but obstinate malady. And yet now the treatment of this disease might be almost as fairly embodied in a new formula—"six days and salicylate of soda"—so truly does this drug act like a charm in cutting short and extinguishing rheumatic fever. The search for specifics is, after all, not vain in regard to certain diseases; and the power for good which their discovery ensures is almost inestimable in its amount and range, when one considers that after a time it becomes an efficient weapon with which to combat disease amongst generation after generation of human beings in all parts of the civilized world.

JAPANESE POETRY.*

MR. CHAMBERLAIN considers that he has discovered one scrap of originality among the Japanese. He quite admits that all their "religion, philosophy, laws, administration, written characters, all arts but the very simplest, all science, or at least what then went by that name—everything was imported from the neighbouring continent." But, though the greater part of the literature is fashioned on the Chinese model and expresses Chinese ideas, the poetry is, he holds, a native product of the country. He bases this opinion on several grounds; but in order rightly to understand the subject it is necessary to glance at the circumstances connected with the introduction of Chinese civilization into Japan.

Tradition places the arrival in Japan of the first Korean teacher in A.D. 284, but history points to the fact that the Chinese language, a knowledge of which was thus first introduced into the country, did not form a subject of general study until about the sixth century. Up to this time the Japanese had therefore been practically without the knowledge of letters. China, on the other hand, had already a large and ancient literature, rich in history, philosophy, and poetry. The "Book of Odes," we know, existed as a collection in the time of Confucius; and if we follow its fortunes we find that, during the centuries of disorder which followed the death of the Sage, its contents were known but to a handful of scholars, who were divided into four schools, each of which pinned its faith to one of the four existing and differing texts. In the fourth century of our era three of these texts had perished, and the fourth, that of Maou, would have shared the same fate but for the retentive memory of a man of the same name, who succeeded in restoring this version. The suspicion which would naturally attach to a text thus preserved is not diminished by the fact that the characters of the language had undergone three distinct modifications of form since the time of Confucius. During the Tsin Dynasty the "greater seal" was exchanged for the "lesser seal" character, and this again for the "official" character, which in its turn made way, in the fourth century, for the characters at present in use. The majority of the poems in the Book of Odes are written in lines consisting of four characters only, but the metres of others vary considerably, and in one (Part II., Book 4, Ode 5) we find lines of five and seven characters combined. With the establishment of the Han dynasty (B.C. 206) there was a general revival of letters, and poetry naturally shared the attention paid to literature by the scholars of the time. Under this new inspiration, the narrow limits of four characters to a line were almost universally disregarded, and by the middle of the sixth century the fashion of writing in lines of five and seven characters was generally adopted. Such was the outward condition of Chinese poetry when it began to be studied, with the remainder of the literature, by the Japanese.

But, turning to the pieces of poetry translated in the work before us, which are principally taken from the *Manyôshû*, a collection compiled in the eighth century, what do we find the condition of the Japanese muse to have then been, and how far does that condition support Mr. Chamberlain's theory of the originality of Japanese poetry? Mr. Chamberlain says that Japanese, unlike Chinese, poetry "regards neither rhyme, tone, accent, quantity, nor alliteration, nor does its rather frequent parallelism follow any regular method. Its only essential rule is that every poem must consist of alternate lines of five and seven syllables, with, generally, an extra line of seven syllables to mark its close." As we have already

* *The Classical Poetry of the Japanese.* By Basil Hall Chamberlain. London: Trübner & Co. 1880.

shown, metres of five and seven syllables were in common use in China at the time when the Japanese became acquainted with Chinese poetry. The absence, however, of rhyme, tone, accent, quantity, and alliteration would, if it existed as universally in Japanese poetry as Mr. Chamberlain supposes, and if these characteristics were so invariably present in Chinese poetry as he imagines, constitute a marked difference. But in the following ode which he has chosen to illustrate his remarks we find that four lines out of each stanza of six rhyme together:—

Utaseumishi	Tama naraba,
Kami ni tahenoba,	Te ni naki-mochito
Hanare-wite,	Kinu naraba,
Ass nageku kimi;	Nugu toki mo naku,
Sakari-wite	Waga kobimu
Waga kofuru kimi	Kimi zo kizo no yo
Ime ni miyetsuru.	

Nor is this by any means an unusual case. On the other hand, the rhymes in Chinese poetry are very irregular, and it is sometimes difficult to recognize them at all. The importance attached to the tones and accents in Chinese poetry finds no place, it is true, in the composition of Japanese verse; but, as regards metre, rhyme, alliteration, and parallelism—of which some excellent specimens will be found in Mr. Aston's Japanese Grammar, second edition—the two schools are, to all intents and purposes, identical.

The existence of expressions known as "pillow words," "prefaces," and "pivots," affords Mr. Chamberlain another reason for believing in the originality of Japanese poetry. "The 'pillow words,'" says the author, "are meaningless expressions which are prefixed to other words merely for the sake of euphony"; and he declines to entertain the idea that so artificial a device can find any parallel in foreign literature. But its extreme conventionality suggests at once the impossibility of its having sprung into life with the first beginning of the national poetry unless it had its root elsewhere. Were it a modern development of a poetic conceit we might be inclined, at first sight, to admit the possibility of its being a Japanese creation; but the history of poetry forbids the idea of any such artificial excrescence finding a place in the composition of primitive poetry. If we turn, however, to the ancient poetry of the Chinese we find, as we should expect to be the case, the true history of this singular construction, at least as far as Japan is concerned, and a more conclusive proof of the foreign origin of Japanese poetry it is impossible to imagine.

In the sketch we have given of the vicissitudes undergone by the solitary text of the "Book of Odes" which existed in the fourth and fifth centuries of our era, it will readily be admitted that corruptions and inaccuracies might easily have crept into it. And, as a matter of fact, we find that at the period spoken of there were—as there are still—certain words prefixed to many of the verses which were declared by the native commentators to be only untranslatable initial sounds, inserted for the sake of euphony. For instance, we find in Ode 8, Book 1, Part I., the line "Poh yen ts'ai che," in which case the last two characters are alone to be rendered, and, among many others in Ode 8, Book 5, Part I., occurs the verse "Yuen yen sze poh," twice repeated; and in both cases we are told that "yuen yen" are untranslatable initial particles. Another line begins with "yon," which we are assured is to be treated in the same way, and altogether, what with initial, medial, and final particles, nine characters out of a total of sixty-four in this ode are declared to be meaningless. Such was the condition of the existing Chinese poetry when it was first brought to the knowledge of the Japanese, and how faithfully they copied it, even to its unintelligible portions, let the "pillow words," "prefaces," and "pivots" say. The "prefaces" are merely extensions of the "pillow words," and the "pivots" possibly find their prototypes in the "Peen t'e tsze" of the Chinese poets.

But the existence of these untranslatable particles in primitive Chinese Odes is as unnatural as in early Japanese poetry, unless some explanation can be offered for their introduction. As far as we know at present, Chinese poetry is original, and they therefore cannot have been imported. The only other way of accounting for their presence is by supposing that in the several modifications through which the characters passed after the collection of the Odes, together with the uncertain readings of the text, corrupt words and passages crept in, owing either to the inaccuracy of copyists or to an inability to decipher the *ku wen* character in which the Odes were in the first instance written. Or, again, it is possible that these expressions, which are called in Chinese *Fü shing*, "initial sounds," and in Japanese *Fü yu* (*okoshi kotoba*), "initial words," as well as "pillow words," were originally intended to be read phonetically, and that, with the lapse of time, the sounds having changed, their meanings have been lost, and that they now appear as the ghosts of their earlier living forms.

If additional evidence were needed of the very close connexion existing between the poetry of China and Japan, it might be found in the simultaneous ebb and flow in the poetic life of the two countries. The Chinese have a saying that poetry had its roots in the *Shu king*, that it came into foliage and budded during the Han and subsequent short dynasties (B.C. 206—A.D. 618), and that it blossomed and bore fruit during the T'ang dynasty (618—907). From this period there was a marked decline in the national poetry; and though in the beginning of the Sung dynasty there arose a few men such as Suo Shih, Go-yang Sow, and others to mark that the poetic fire was not quite extinct, the prevailing dearth of genius testified only too plainly that the golden age of poetry was past. In the same way, in Japan "the

sources of the lyric poetry suddenly dried up" at the commencement of the tenth century, as Mr. Chamberlain tells us; and the subsequent fortunes of the muse in both countries cannot be better described than in his own words. "Thenceforward," he writes, "instead of the heart-outpourings of the older poets, we find nothing but empty prettinesses and conceits, confined within the narrowest limits."

The same remark applies to the drama, which first reached a high pitch of excellence in China during the Yuen dynasty (A.D. 1280—1368), and which faded away at its close. During the greater part of this period the relations between the two countries were very disturbed; and it was not, therefore, until towards the end of the fourteenth century that the lyric drama arose in Japan. Mr. Chamberlain gives in his introduction a sketch of a Japanese theatre, and no one acquainted with the stage in China will doubt for a moment the identity of the two. The arrangements of the theatre, the dress of the actors, the conventional intonation they give to their utterances, the absence of scenery, and the consequent necessity imposed on the actors of describing their circumstances and condition when first "coming on," are points of similarity which cannot be merely incidental. The form and matter of the dramas themselves are also essentially Chinese, and, were it not for the names, a casual reader would find it difficult to say whether the plays given at the end of Mr. Chamberlain's volume had their origin in China or Japan.

Both in these plays, and in the poems in the earlier part of his volume, Mr. Chamberlain has faithfully reflected the meanings of the originals, and has clothed his translations in very readable English. But after what has been said, those who are acquainted with Dr. Legge's translation of the *Shu king*, and Sir John Davis's *Poetry of the Chinese*, will not expect to find any great play of the imagination in the *Classical Poetry of the Japanese*; at the same time there is in many of the pieces translated by Mr. Chamberlain a quaint prettiness which is not without attraction.

THE BLACK ROBE.*

MR. WILKIE COLLINS has little or no dramatic art, and yet he persists in giving a dramatic turn to his stories. He cannot be content with the ordinary modes of writing a novel. He neither avowedly tells his whole tale in his own words, nor gives it, as is so commonly done by other authors, in the words of either the hero or the heroine. On the contrary, he passes from one narrator to another as it pleases him; and, in utter defiance of all probability, makes any person that suits his convenience keep a diary or write letters at great length. If he had the power of throwing himself into each character, and of making each one speak with a certain air of naturalness, we do not know that we should have much to say against this mode of narration. It might be a little troublesome to the reader, and perhaps a little tiresome; but, on the other hand, there would be some pleasure gained in the study of the author's dramatic art. In Richardson's novels, for instance, no one for a moment complains of the number of writers whose letters, like so many rills, all swell—form, indeed, we should say—the great current of his story. On the contrary, perhaps we are more pleased by remarking the art with which the author passes so completely from one style to another than by anything else in the book. But there is none of this satisfaction to be had in studying Mr. Collins's stories. We do not know that he even makes the attempt to disguise himself. He tells his readers that now it is a major who, "with a due sense of responsibility," has written "a narrative of personal experience," and that now it is an English Jesuit priest who is sending the most minute details to the Head of his Order in Rome. At another time he makes one of the heroes keep a diary, and once or twice he avails himself of the private correspondence of a detective officer to carry on the tale. Then he jumps back into his own person, and for a while carries on the narrative himself. Nothing can well be more absurd than the style in which some of his characters write. The chief villain of the piece is a man after Mr. Newdegate's heart, or rather, we should say, a man strictly in accordance with Mr. Newdegate's imagination. He is a Jesuit priest, who weaves a cunning plot to recover for his Church a fine estate of which she was deprived in the reign of Henry VIII. He is in constant correspondence with "the Secretary, S. J. Rome." Nothing, it would seem, is too petty to interest that highly respectable Italian ecclesiastic. It is quite clear that he has not been exposed, as we have, to a long course of novel-reading; for we are quite convinced that, if he had, he would, at a very early stage, have packed off his correspondent to the interior of New Guinea, or to the furthest borders of Crim Tartary. Let Mr. Newdegate and his friends, who live in such constant terror of the machinations of the Order of Jesuits, take courage. None surely ought to be a cause of alarm who willingly either write or read such nonsense as the following. The priest, we may first observe, is narrating a conversation with the heroine's mother:—

"Are you tired, Matilda? No? Then give me another turn, there's a good creature. Movement, perpetual movement, is a law of nature. Oh, dear no, doctor; I didn't make that discovery for myself. Some eminent scientific person mentioned it in a lecture. The ugliest man I ever saw. Now back again, Matilda. Let me introduce you to my friends, Father

* *The Black Robe*. By Wilkie Collins. 3 vols. London: Chatto & Windus. 1881.

Benwell. Introducing is out of fashion, I know. But I am one of the few women who can resist the tyranny of fashion. I like introducing people. Sir John Drone—Father Benwell. Father Benwell—Dr. Wybrow. Ah, yes, you know the doctor by reputation? Shall I give you his character? Personally charming; professionally detestable. Pardon my impudence, doctor; it is one of the consequences of the overflowing state of my health. Another turn, Matilda—and a little faster this time. Oh, how I wish I was travelling by railway."

The story opens with what Mr. Collins calls two scenes. The former of these is headed "Boulogne-sur-Mer.—The Duel," and the latter "Vango Abbey.—The Forewarnings." The narrator is a Major Hynd, a friend of one of the heroes. Which of two men is the chief hero we are puzzled to decide. Mr. Romaine occupies much the greater space in the book. Moreover, he is the owner of Vango Abbey, has 18,000*l.* a year, kills a man in a duel, is tormented by a mysterious voice, is plotted against by the Jesuits, has dark violet-blue eyes, marries the heroine, and at last dies in a way to which justice could only be done on the boards of a strolling theatre. On the other hand, Mr. Winterfield is also the owner of a very pretty estate, and, to make up for his deficiencies in any other respect, he marries the heroine twice over. Moreover, he has that mark of the true hero that, when the curtain falls on him and her, it falls on a happy pair. It is not, however, till rather late in the day that he appears on the scene, and our present duty is with Mr. Romaine. This melancholy but most amiable gentleman is, when the story opens, summoned to Boulogne to attend on the deathbed of an aunt. He is accompanied by Major Hynd. There he falls in with a man whom he had known at Oxford, who invites him to dine with him at his boarding-house. The Major is included in the invitation, and the two men find that they have fallen among a set of swindlers. Romaine takes more champagne than is good for him, and is led on to play for high stakes. He discovers that he is being cheated by a French general. The General adds to his misconduct by spitting in his victim's face. The victim, as well became an Englishman, dealt the General a blow straight between his eyes. A challenge is given, and a duel arranged for the next morning. Fortunately, or unfortunately, the General has meanwhile a fit, but his place is taken by his elder son. Romaine refuses to fight a youth with whom he has no quarrel, but the young gentleman strikes him with his glove, and asks whether he must go on to spit at him. The end of course was, as has always been the case with every duel between an Englishman and a Frenchman, that, though our countryman was utterly inexperienced in the use of his weapon and his opponent was a practised shot, it was not he, but his adversary, who was killed. A dense fog had come over the combatants—so dense, indeed, that Romaine had shot the Frenchman without even knowing it. The surgeon, however, was heard calling for a light. But then "the silence gathered round" the two Englishmen again. "On a sudden it was broken, horribly broken, by another voice, strange to both of us, shrieking hysterically through the impenetrable mist. 'Where is he?' the voice cried, in the French language. 'Assassin! assassin! where are you?'" The two men, without giving an answer, soon afterwards take the steamer to England. Among the passengers was the heroine, who falls in love with Romaine at first sight. He, however, does not take any notice of her, but with a wild look of terror stares into the engine-room. She, with the utmost readiness, interrupts the Major as he was leaning over the bulwarks, and sends him to his aid. The unhappy hero had again heard the voice crying out, "Assassin! assassin!" though his friend could distinguish nothing but the thump of the engines. The two men went down to Vango Abbey, but even there the voice kept up the pursuit. The old butler was in blank amazement at the disorder in his master's look, but does all that an old butler can do under such trying circumstances. This voice throughout remains somewhat of a mystery. Later on in the story we learn that the General's younger son was a lunatic. He it was who had suddenly appeared on the scene of the duel, and had given Romaine his first scare by screaming out when he saw his brother fall. If we understand the story aright, he was hidden away on the steamer, perhaps in the disguise of a stoker, and there had given the hero his second scare. He had, we believe, also made his way to the Abbey. But the matter seems to be left as a mystery, and perhaps something was due to Romaine's diseased imagination. Nevertheless, this young lunatic plays a very important part in the story, and by his theft of certain documents greatly advances the plot of the Jesuit. We have not had, we must confess, the patience to track the boy in his wanderings, for the gross and ridiculous improbabilities of this part of the book were more than we could easily support. At last he fortunately has an attack of typhus-fever, by which he recovers his wits but loses his life. The reader has been so worried by him that he hears of his death not only with the utmost composure, but even with thankfulness.

In fact, the confusion caused by the Jesuit and the lunatic is so great that we had hardly patience left even for the love-making, and yet patience was needed, for of love-making there is a great deal. For while the priest has his plot to convert the hero, to keep him single, and to make him restore all his lands to the Church of Rome; a nobleman and his wife have, in their turn, their plot to marry him off as speedily as they can, and to keep him a respectable, virtuous, and happy member of society. By a remarkable coincidence, it comes about that the lady whom they had in their minds selected as his wife was the charming young person who had crossed over with him in the steamer, and had noticed him staring wildly into the engine-room. We ought, by the way, to

have stated before this, so as to remove, at all events, one improbability from the book, that the passage had been calm. She, charming and admirable though she was, did not in the least hesitate about taking her share in the plot. So readily, in fact, does she go to work, that "at a brilliant assemblage of guests" in the nobleman's house, where "titled and celebrated personages" were gathered together, she took advantage of a recess in a conservatory to give him a kiss, even before he had thought of asking for one. He cannot even be said as yet to have made love to her; but the old order of things is rapidly passing away, and no doubt she was acting strictly within the rights of women. A marriage is soon arranged and brought about, and for a time the young couple are very happy. The priest is not, however, thus to be cheated of his prey. He discovers that to the heroine some mystery attaches, and that it was a mystery connected with Mr. Winterfield, the other hero. He employs a detective, and soon gets on the right clue. He sows distrust between the newly-married pair, and before long he convinces Romaine that he is not a married man, as he had married, so he maintained, a woman who was already another man's wife. The unhappy lover with all promptitude becomes a convert to Rome, is in due time ordained a priest, and makes a will in which he leaves Vango Abbey to the Church. So famous does he become for his zeal and his eloquence, that it seemed not unlikely that he should die a Cardinal. But a Jesuit-plotter, however clever he may be, is never a match for the last half of the third volume of a novel. There he is sure to be tripped up. The mystery is at last solved, the conspiracy is discovered, and the penitent convert has just time to hand over his will to his youthful son and heir, as the child was amusing himself with making a blaze on the hearth. The Jesuit springs forward to save it from the fire, but he is grasped by the throat by the second hero, who fortunately happened to be on the scene. The will is burnt, the father makes a highly picturesque end, in spite of "the baffled Jesuit, who turned furiously on the dying man," and then frowned darkly. Nothing is left for the author but to leave a decent time for mourning, and, when that has gone by, to marry the heroine a second time to the second hero. The Jesuit, it will be seen, had had some grounds for his assertions; but he had forgotten to add that at the time of the first of the heroine's three marriages the second hero had himself a wife living. As Mr. Winterfield was a most exemplary gentleman, we will not leave him with even the suspicion of a stain on his character. We hasten to add, therefore, by way of conclusion, that he had not married for the second time till he was firmly convinced, and on very good evidence too, that he was a widower.

THE ROMAN POETS OF THE REPUBLIC.*

THIS book is a second edition, but it is a second edition which has more novelty about it than many first editions. In the first place, Professor Sellar's original work on the Roman poets of the Republic has been long out of print. Some twenty years have passed since readers, just emerging from the state in which the study of the classics is a mere task imposed by pastors and masters, found in it a delightful introduction to that study as an exercise in literature. The present issue, therefore, addresses itself to an entirely new audience. Moreover, since the appearance of Professor Sellar's book, the two greatest poets whom he discusses have been the subject of critical studies from the purely philological point of view which have made them much more popular with English students. Mr. Munro's work on Lucretius, and the work of the same scholar and of Mr. Robinson Ellis on Catullus, are contributions from the two great Universities, which deserve to be completed by a treatment of the same subjects, which should take their mainly scholarly labour into consideration, and should deal with their subjects from the point of view of literature. Some sixteen or seventeen years ago, when Mr. Munro's Lucretius had not yet made the greatest of Roman poets a favourite study, it happened sometimes that an Oxford undergraduate who had taken up that author for "Muds" would receive a "written paper," the absence of competitors making it not worth while to print the questions. This would hardly be likely to occur now, and the *raison d'être* of Professor Sellar's reprint is all the more cogent. There is, moreover, something to guard against as well as something to supply. Roman literature, like most other literatures, has received its share of the *ventosa et enormis loquacitas* which nowadays too often mistakes itself for critical insight. Lucretius and Catullus are particularly tempting to "precious" critics, and they have not escaped their attentions. Here, again, the work of Professor Sellar is particularly welcome. Although thoroughly appreciative, he is never gushing; he never indulges in the false analogies and tinselled frippery of ornament which too often pass muster nowadays for criticism. In short, his book, both as we remember it nearly twenty years ago and as we have it before us to-day, holds a remarkable mean between merely philological prelection, the product of somewhat barren and often tasteless science, and merely literary babbling, the product of facile and equally tasteless art. Unfortunately, we have not many representatives of this kind of scholarship nowadays, and it is all the more to be desired that such as we have should keep themselves on evidence.

* *The Roman Poets of the Republic.* By W. Y. Sellar. Oxford: Clarendon Press. 1882.

The greater part of what has been just said would apply to the first nearly as well as to the second edition, but they are in truth very different books. In the first, owing to a reticence which we remember wondering at, Roman comedy, despite the important position it holds in the scanty literary baggage of pre-Augustan literature, had no place. In the present volume, Plautus and Terence have each a chapter, and the first is an excellent example of criticism. There are persons who talk as if Ritachl had invented Plautus—a curious example of the odd attitude of certain forms of modern scholarship. No one who, with a sufficient knowledge of Latin and a sufficient appetite for literature, has ever studied the Umbrian poet, in no matter what edition, can have failed to see that he gives us one of the most genuine types, if not the most genuine type of pure Italian letters, affected, indeed, in form by Greek models and teaching, but hardly at all affected in spirit. Professor Sellar has given to Plautus in this new edition an essay of fifty pages, which we do not hesitate to say is the best thing of the kind in English. It is necessarily written to a certain extent in shorthand, and the treatment of the characteristics of individual plays, especially in comparison with the subsequent handling of the same subjects by later dramatists, is somewhat stinted. For instance, the extremely interesting study of the three Amphitryons—Plautus's, Molière's, and Dryden's—is omitted. But this is a matter of course, unless Professor Sellar had expanded his one volume into two or three. The exposition of the chief types of character which Plautus employs, and which, unlike those of Terence, are by no means the mere cut-and-dried personages of a *Commedia dell'Arte*, is excellently given, and the chief exemplifications of them in the different plays are happily touched off. In dealing with Terence it may, perhaps, seem to some readers that Professor Sellar has accepted the definition "diminute Menander" too completely, and has not devoted quite sufficient space to the admitted excellences of his style and diction. For our part, however, the subordination of the minor poet to his greater rival has nothing that we feel inclined to quarrel with. The fuller account now given of the unsatisfactory, because utterly fragmentary, work of Lucilius is welcome, and the alterations introduced into some of the general chapters bear witness to the pains with which Professor Sellar has kept abreast of the various studies of his contemporaries in his subject.

After all, however, any study of Roman poetry before the Augustan age must always consist mainly of a discussion of the greatest didactic and the greatest lyrical poet of Rome. Of Ennius—stimulating as he seems to have been to his countrymen, and felicitous as are some of his fragments—it is hardly unfair to vary the joke about Provençal epic by saying that he has *le défaut d'être perdu* and several other defects besides. Lucilius, though more of him is in evidence, is in much the same case; all the other non-dramatic, and most of the dramatic, poets are in worse case; the dramatists themselves are only half poetical, and one of them is profoundly un-Roman. But in Lucretius and Catullus most students of literature have been long convinced that they possess the finest example of purely Roman and the most exquisite example of general Italian culture. Both, like their compatriots in general, adopted foreign forms and dealt with partly exotic subjects, but both have left in their work a profound savour of the soil. Professor Sellar has given in this revised edition of his book a hundred and twenty pages to the author of the *De Rerum Natura*, and about half that space to Catullus. The management of Lucretius is always rather a difficult matter. Most writers devote themselves chiefly to his subject, and struggle to acquaint the reader with the history and purport of the atomic theory and of epicureanism. Professor Sellar has not neglected this; but he has, as we think, quite rightly given it a comparatively subordinate place. It is idle to pretend that Lucretius is to us important first as a philosopher. He is important as a Roman man of letters, and anything which tends to obscure this is to be regretted. We do not wholly agree with Professor Sellar's view of the poet, who perhaps most of all poets fixes his grasp on the reader who has once allowed that grasp to be planted. His idea of Lucretius as a calm observer, one who from a deliberate distaste to the life of action and social pleasure deliberately chose the life of contemplation, is not, we must confess, our own. Nor can we think that the famous passages of the Third and Fourth Book show merely that he had been a witness of "the conditions of life under which the follies of the *jeunesse dorée* and of sated luxury had been engendered." The accent of regret and of individual satiety seems to us a great deal too strong for any such belief as this. Nor should we be disposed to make quite so many concessions as Professor Sellar has made to the Devil's Advocate in respect of the general conception of the poem. But these are matters of individual taste, and it must be admitted that, as in the case of some few other poets, there is a kind of "ivresse de Lucrèce," which, when one has once been infected by it to a considerable extent, disables the critical judgment. The Hexameters of Lucretius have more than any other verses with which we are acquainted, except some choric verses in Æschylus, the same effect as the Alexandrines of Victor Hugo. But the separate portions of the poet's power are admirably treated by Professor Sellar. The fervent enthusiasm pervading the book, the strong throbbing pulse of the verse, the power over mere language, the "gathering intensity of movement," to quote a happy phrase of the Professor's, the freshness of feeling for nature, the sense of the vague and vast, the imaginativeness of analogy, the vivid pictures of outward scenes which make Lucretius at once one

of the most modern and one of the most classical of poets, all receive from Professor Sellar paragraphs of indication which, if, as we have noticed, they are free from "intensity" and "preciousness," have for that very reason an academic sobriety and grace which is refreshing enough. No one, perhaps, of Lucretius's many critics has seized the mixture of depth of feeling with grave irony of expression which make him fully deserving of the title of humourist as well as that of poet better than Professor Sellar.

In dealing with Catullus the critic has an easier task. The slight bulk of the exquisite contribution made by the Veronese singer to the poetry of the world, and its freedom from tedious didactics or obscure philosophical stumbling-blocks, are no small advantages possessed by the younger over the older friend of Menenius. The running comment which Professor Sellar gives on most of the poems is very good; and he has duly condescended to the fancy for personal and intimate details in trying, with the assistance of his forerunners, to make something of a regular *Elle et Lui* romance out of the Lesbia poems. That he has sometimes used Sir Theodore Martin's version is another excusable condescension. Whether, as some have said in their haste, all poets are untranslatable, is a point upon which we shall not take upon ourselves to decide; but it is pretty certain that Catullus is. To a sculptural felicity of expression, not inferior to that of the best Greek epigram writers, he adds a passion and a picturesque faculty which they rarely possessed. But he is a smaller phenomenon than Lucretius, if also a more exquisite one; and Professor Sellar has succeeded in doing him justice in the comparatively restricted space which he has allowed for the doing. Whether the parallel which Professor Sellar, following Mr. Munro and an anonymous writer in the *North British Review*, institutes between Catullus and Burns be sustainable we shall not pause to consider. There is certainly more in it than the average Englishman, to whom the dialect of Burns is as ashes between the teeth, may feel disposed to allow. But the terms in which Professor Sellar himself formulates the contrast make, at least, an admirable portrait of the elder poet:—"In the passionate ardour of their temperament, and the robustness, too closely allied with coarseness, of their fibre; in their susceptibility to beautiful and tender emotions, and the mobility of nature with which they yielded to impulses the most opposite to these; in their large capacity of love, and scorn of pleasure and pain; in their genuine sincerity, and firm hold on real life; in the keenness of their satire, and their shrewd observation of the world around them; in their simple and direct force of feeling and expression; in the freshness of their love for the fairer objects in nature with which they were most familiar, they have much in common."

This is excellent criticism excellently expressed, and the book in which it appears, and which contains much more of the same stamp, ought to guide not a few of the present generation of students, as its predecessor guided not a few of a former one, in the path of really literary study of a delightful chapter of literary history.

CUNNINGHAM'S CHURCHES OF ASIA.*

WE imagined from Mr. Cunningham's title that his book would turn out to be a new commentary upon the first three chapters of the Apocalypse. The author of the excellent *Dissertation on the Epistle of St. Barnabas* might fitly have chosen such a subject, and he would have treated it with ability and freshness. But we are agreeably disappointed. His work is the *Key Essay* for 1879. It is an ingenious attempt to account for the Church as it is by tracing the Christian "idea working itself," to use the author's own words, "in the planting of the Church." Mr. Cunningham is far more anxious that we should pay due regard to his method than to his conclusions. It is for the former that he chiefly values his book, for it is evident that he does value it, modestly as he speaks of its execution. His conclusions are those of an orthodox Anglican clergyman of our generation. The method by which he has arrived at them, and with which he seeks to lead up his readers to them, could only have been acquired by one who had sat for a time both in the school of Hegel and in the school of Baur, but with an evident preference for the former. To a certain extent Mr. Cunningham may claim to have "spoiled the Egyptians"; in any case he seems to have the mind to spoil them.

The author holds that it is the first task of the historical student, provided that he believes there is a law at work beneath history, to detect and delineate "the force which was mainly operative" in the period which he is studying; next, he has to "exhibit it in conflict with other influences"; and, lastly, to "trace out the results of the struggle." This is Mr. Cunningham's position. That which he here describes as "the force" appears afterwards as the "effective idea" of a special epoch. The students of that epoch will first notice this effective idea "as a conviction or aspiration impressing many minds; they will find it also expressing itself in the sayings and doings of multitudes of men, and at length embodying itself in the institutions of society." The italics are Mr. Cunningham's, and the italicized phrases represent the successive steps of his method. "I have tried to delineate," he says, "as clearly as possible, from contemporary evidence, the conviction which impressed all Christian minds; I

* *The Churches of Asia*. By William Cunningham, M.A. London: Macmillan & Co. 1880.

have described the conflicts which ensued when it began to express itself and make itself felt as an effective force in the world; I have sketched the actual institutions which grew up under its influence; and thus I have endeavoured to trace the Christian 'idea working itself out' in the planting of the Church." The substance of Mr. Cunningham's book is composed of three divisions exactly corresponding to the three steps thus indicated—the conception of the Christian society current in Asia at the beginning of the second century; the conflict with non-Christian influences; and the nature of the Christian institutions as reflected in the Marcionite, Montanist, and Quarto-deciman controversies. These larger sections, in which Mr. Cunningham applies his method, are preceded by an introduction on the standpoint, plan, and sources of his investigation, and they are followed by an appendix of extracts from St. Clement of Rome, St. Ignatius, the Shepherd of Hermas, Justin Martyr, and the Apostolical Constitutions, as "illustrative of Christian life during the second century."

We have kept as closely as was practicable to Mr. Cunningham's own words in giving a summary of the aim and contents of his book. It would probably strike a bystander who was overlooking a group of Hegelian students during their employment of this method upon a particular epoch of history, that each student was by no means certain to discover one and the same "force," or one and the same "effective idea" impressing many, expressing itself by multitudes, and socially embodying itself in the institutions of that epoch. Each student might feel convinced that he had quite stripped himself of prejudice, but he could not jump away from his own shadow. The history of many things may be said to begin with the beginning of the history of the Church, and it is also a critical epoch in the history of many more things. Each student of such an epoch will be almost sure to find in its documents and its characters the confirmation of the theory with which he was already more or less consciously possessed when he began his study, which he honestly regards as a strictly scientific investigation. Hence, in spite of the Hegelian shield which Mr. Cunningham opposes to one of Baur's arrows, we cannot help thinking that Baur is right when he demands that we should "place before ourselves the materials given in the history, as they are objectively, and not otherwise." The historical student of Rationalism, or of Culture, or of Humanity, or of Sociology, or of Morals, or of any other defined subject, who takes the second century as his epoch, will probably not detect the "force" or "effective idea" exactly where Mr. Cunningham has detected it. Two writers, each equally bent upon strictly scientific investigation of the documents, sit down to write the history of the Reformation. One regards it as a daring break with the outward authority of the Pope, the other as a return to the outward authority of the Bible. One detects in the theses of Luther, and in all the documents and persons, Rationalism in germ; the other detects in the same documents the "force" or "effective idea" of all the subsequent social institutions of Puritanism and Methodism, which are the very antithesis to Rationalism. Both may be right; but it is the comparatively "objective" historical student who is most likely to discern where each is right and also where each is wrong. The Tübingen school demands in the historical student not merely "strictly scientific investigation," but scientific *Objectivität* and *Tendenzlosigkeit*; and this latter is the equivalent to Mr. Herbert Spencer's desiderated freedom from "bias." We believe that this latter sort of freedom is only conditionally possible in any human creature who is employed upon the study of men, and who hopes to influence opinion. A negative bias is as operative as a positive bias, and a student of the documents of the second century who does not accept the Nicene Creed is as likely to show that he is not gifted with *Tendenzlosigkeit* as one who accepts that Creed. We doubt if a purely objective and unbiassed student would have the heart to go very deeply into the social study of men. He loses some of his objectivity by thinking of the persons for whom his book is intended. He can only hope to be, as we have already hinted, a comparatively "objective" investigator. We think that Mr. Cunningham's bias is manifested early in his essay; but we do him no more than justice when we say that few recent English writers on Church history have so good a claim as he has to be accredited with the attainment of a comparative "objectivity."

Mr. Cunningham precedes the demonstration of his own method with a short delineation of the method of three characteristic ecclesiastical historians—Baur, Neander, and Baronius. It is curious that a similar process, elaborated at far greater length, was attempted nearly half a century ago in the late Mr. Maurice's *Kingdom of Christ*; or, *Hints on the Principles, Ordinances, and Constitution of the Catholic Church, in Letters to a Member of the Society of Friends*. Mosheim, Neander, and Milner were there treated as the three types of the ecclesiastical historian with a wrong method. Maurice showed that there was a radical defect in each of the three methods—the Liberal, Spiritual, and Evangelical, as he called them—and thereupon proceeded, as Mr. Cunningham now does, to unfold his own method. Mr. Cunningham's curt condemnation of Baur's theory reads very much like a reminiscence of Mr. Maurice's more elaborate condemnation of Mosheim's theory. The similarity is still more remarkable between Mr. Cunningham's short section and Mr. Maurice's long section upon Neander's historical method. "Neander affirms," said Mr. Maurice, "that Christianity is a principle of new or spiritual life, the operation of which is simply in and upon the heart of the individual man. Every outward and visible institution is only something adopted as a

necessary means of giving the principle efficiency in a world which does not recognize it. Some form these institutions must have; but the moment they depart from that form, which is a mere confession that they were adopted as a device to meet an evil and imperfect state of things, the moment they attempt to explain the idea and principles of Christianity, that moment they are to be denounced as the indications of the growth of a corrupt and evil spirit." We cannot quote the whole of Mr. Cunningham's section upon the method of Neander; but a few sentences from it will prove that its writer had studied a teacher whom so many use, but whom so few quote. "Some sort of conception of the Christian Church," says Mr. Cunningham, "underlies Neander's description of its growth. The Apostles are regarded as missionaries who converted a large number of individuals; each of these individuals had a firm faith in his heart. It almost seems as if Neander believed that each step that was taken in organizing the Christian society was a departure from the purer life of the past. He writes as if he believed in the fortuitousness of the development of the various Christian institutions, and looked upon them as evils which were necessitated by the corruptions that overtook the primitive purity of Christian life." The words may differ, but the thought is substantially the same, and when Mr. Cunningham goes on to the construction of the positive part of his work, we are continually struck with its material likeness, in spite of superficial and formal differences, to the methods expounded by Mr. Maurice. Mr. Cunningham, to use the words of the latter, "connects Christianity with Judaism, and exhibits it as the expansion of the Jewish idea." He undoubtedly brings to his exposition a familiarity with modern German theologians and critics to which Mr. Maurice laid no claim; though we must say that the author's references to some of them—as, for instance, to Rothe, whose *Anfänge* is too little known to Anglican students—presume too much upon the knowledge of his readers. The "force" and "effective idea" which Mr. Cunningham detects and delineates is the hope of Israel, the Messianic setting-up of the Kingdom of God in this world. The first Church was a Christian Synagogue. Jerusalem was the divinely-appointed centre of the Church, and for a certain period was acknowledged as such by the Christian totality, and the head of the Church in Jerusalem was the vicegerent of Christ. His position is substantially the same, up to a certain point, as that which has been laid down by the learned Rabbi of Breslau, Dr. M. Joel, in his recently published *Blicke in die Religionsgeschichte zu Anfang des zweiten christlichen Jahrhunderts*. Dr. Joel regards Christianity as the "Verwirklichung" (as Mr. Cunningham's "idea working itself out") of the Jewish Messianic hope. In its origin, he says, Christianity was Jewish—national and anti-Gentile. Jews and Christians regarded each other, not as enemies, but as friends; they both clearly recognized a common enemy in St. Paul—an assertion true only of the Judaic Christians. Trajan permitted the rebuilding of the Temple; but its hindrance, says Dr. Joel, was a question of life and death for "the anti-national Christians"—that is to say, for the Catholics, who had already attained to the perception that the kingdom of the Messiah was intentionally as wide as humanity is, and that it was meant to embrace "all nations" and "every creature." It is only from the narrow Jewish point of view that the followers of St. Paul would be called "anti-national" Christians. St. Paul is distinctly "the Apostle of the Nations." He perceived that the actual and existing constitution of the world into nations and organized neighbourhoods was as truly the product of the Divine Will as the Church itself was, and that it was the duty and business of the Church to conform herself and her institutions to the pre-existing order prepared for her by the all-disposing providence of the King of heaven and earth. Dr. Joel contends that the enmity of the Jews against Christianity, and their prohibition of the Greek language, date from the opposition of the "anti-national" or Pauline Christians (whom we "Gentiles" should rather call the national Christians, the Catholics) to the rebuilding of the Jewish Temple. St. Paul's whole life, in its relation to the Church, was a struggle for all time on behalf of the principle of nationality—but of every nationality, whether then manifest or only dormant—against the principle of ultramontanism or ecclesiastical internationalism. What Rome later assumed to be, Jerusalem was represented as being by the Judaic Christians in St. Paul's lifetime. The Church of Jerusalem was the apostolic see; the vice-regal throne was planted in it; she was the mother and mistress of churches; she was definitely "the Church," and every man, Jew or Greek, became by baptism a member of the Church of Jerusalem, a spiritual subject of St. James.

Mr. Cunningham has a clear sight of these facts, although he states them in a very different form, being all along held in some bondage by his determination to get rid of the word "Church" with all its modern associations in order to render his investigation strictly scientific. We have spoken of the actual world as constituted of nations and organized neighbourhoods—cities, villages, communes, or parishes. But when the Church first appeared in the world, when an "Apostle of the Nations" was sent out, the huge Roman internationalism had apparently obliterated all nations. They were existing, but dormant. St. Paul spoke of them as existing in his sermon at Athens; his Epistle to the Church of Rome, significantly enough, is full of references to their existence. *ἔθνη* is one of the most characteristic words of the apostle, and *ἔθνη* is but rarely translated in our version as "nations," but over and over again as "Gentiles." The other

humanity in the midst of which the Church appeared, local civil polity, was in vigorous and active life. Hence, in place of the national organisation of the Catholic Church, which is now opposed to its Roman ultramontanist centralization, a civic organization of the Catholic Church was in the second century opposed to its Jewish ultramontanist centralization. Mr. Cunningham brings out this fact in his own way by tracing how the Christian brotherhood in the Greek cities of Asia, contemporary with the existence of the viceregal episcopate in Jerusalem, by the "working out of the Christian idea" became "that which the Greeks had striven to realize—a federation of free democracies. The Church in each city was self-disciplining, possessing authority over its officers, and worshipping and communicating with other Churches as a unit; yet the Church throughout the world was after all one, and it were well that each city should interest itself in and care for the needs of all the federation." There is not a page in Mr. Cunningham's work which does not show the results of conscientious thought and study; it merits to be widely read; but perhaps its most valuable characteristic is the rare clearness of the author's perception that the Church is an organism and not a mechanism.

AMERICAN LITERATURE.

MR. DORMAN'S work (1) is, we fear, likely to receive less attention, or, at any rate, less favour, than it deserves from the dominant school of comparative mythologists. Dealing only with the aboriginal superstitions of North America, and here and there, at somewhat less length, with those of the Southern continent, he derives from this limited but detailed study conclusions by no means in accord with the fashionable theories of the day. According to his views, and to much of the evidence, such as it is, which he has collected, not only are the Indian heroes not solar avatars, or representatives of the sun, but, where the sun or other heavenly body is worshipped, it is because some Indian chief translated to heaven is supposed to have been converted into the sun, moon, or morning star, or to inhabit the luminary in question. We cannot say that we incline to look on this counter theory as by any means proven. The evidence is much less obvious than the bias of the writer, whose disposition to trace all idolatry, and nearly all supernaturalism, to ancestor-worship is applied with no greater discrimination, and with much less of ingenious demonstration, than the solar-key of Mr. Müller, Sir George Cox, and other comparative mythologists on this side of the Atlantic. There are, without question, Indian and Iroquois myths which have been invented to account for celestial phenomena and attached to human and terrestrial agents; and, where this has been done, even if the hero's name be identical with that of some famed Hercules or Achilles of the Far West, it is not the less evident that the origin of the myth is astronomical, and its connexion with an historical or traditional name purely accidental or poetical. Among the more civilized tribes of Central and Southern America, the favourite objects of popular adoration are what Mr. Dorman calls culture heroes, personages occupying in tradition every kind of situation, from that of Ceres to that of Solon. Some of them are certainly in character, if not in origin, divine; incarnations of natural or supernatural power, even if their names have an actual place in the history of the nation. Others are almost as certainly real personages, invested with many mythical attributes. It is difficult to conceive, for example, the founder of the Peruvian dynasty as a real human being; the solar genesis of the Incas seeming as distinctly a form of monarch worship as the similar relationship assigned to the Pharaohs. On the other hand, those who have studied most thoroughly the traditions and historical inscriptions of Mexico concur in regarding many of the principal objects of Mexican adoration as distinct historical characters; as representing in some memorable instances an actual and prolonged conflict between the ferocious barbarism of the national religion and a softer, less warlike, and probably higher civilization from which the atrocity of human sacrifice was altogether excluded, a conflict which may represent an individual effort at reform, but somewhat more probably a conflict between the hereditary ideas of different races combined under a single rule. The superstitions of the North American Indians are much less interesting, and their character, as well as their interpretation, rests on much less satisfactory evidences. They have no records; their pictorial representations are barbarous in the extreme, delineations of human or semi-human figures as utterly regardless of truth as the first drawings of a child, and made even worse than these by the introduction of a conventionalism which dispenses with even such attempts to represent reality to the eyes of others as a child of average intelligence would be sure to make. In truth, what we know of the ideas respecting a superior Power and a future life cherished among the hunting tribes of the North, we know only through missionaries or Puritan settlers. The former strove to see in every native superstition some trace of a primeval religion akin to Judaism, if not to Christianity, and often imported ideas, evidently of their own origination, into the speech and possibly into the thoughts of those with whom they conversed. The Puritans who settled New England, and first came into extensive collision with the aborigines, represented

all that was most savage and barbarous in the English temper, all that was most unchristian in the Protestant Christianity of their age. It was their aim to represent and to regard as worshippers of the Devil those whom they desired to rob and murder. It is impossible to read even a few pages of their writings on this or any other subject without detecting in them a tendency to believe much more firmly in the Evil Principle than in the Deity they professed to worship—a firm belief that they, the few thousands who professed their hard and hateful faith, were the only objects of Divine care, and that they were rendering good service to their God as well as to themselves in butchering those whom it therefore suited them to accuse of every kind of spiritual abomination. It is partly to the poets and novelists of a later age, partly to the better faith and better feeling of the Jesuit missionaries, that we owe the current ideas of the fundamental beliefs of the Indian tribes; and it is noteworthy that Mr. Dorman does his best to minimize our supposed knowledge and to revive the Puritanic conception of Indian worship. The idea of the Great Spirit could not have come from a race or a Church like that of New England; it is a far higher idea than any Puritan was capable of entertaining. The Indian Manitou is so incomparably superior to the God of Cotton Mather that it is impossible to derive the former from the latter. And the Indian ideas of sorcery may have been largely modified by Puritanic or negro importations; they bear, at any rate, a striking resemblance in certain points both to Puritan and to African superstitions. It is hardly possible to doubt that Mr. Dorman tends to exaggerate the absurdity and extravagance of native credulities. The races who could be hampered by such ridiculous and inconvenient follies, could hardly have become the resolute, daring, persevering hunters and warriors we know them to have been. In truth, Mr. Dorman seems to have gathered much of his Indian mythology from the existing remnants of those tribes degraded by white cruelty and tyranny, and infected by superstitions that had, and must have had, their origin in a false civilization, not in a natural barbarism.

Mr. Powell's *Introduction to the Study of the Indian Languages* (2) is really an elaborate, scientific, or metaphysical treatise on the structure of these languages, a contribution to comparative grammar rather than a real guide to the actual tongues spoken by the few remnants of the races that once possessed the vast territory of the United States. These languages, indeed, are so fluid, so liable to change their form from time to time, that a permanent vocabulary, or even grammar, might be somewhat difficult to construct, and when constructed, might not last long in use. As Mr. Powell observes, the root-words, which seem seldom to be used independently, are all that have a distinct representation, an available synonym, whereby they can be translated into English or any other European tongue. The combinations by which these root-words are made to express a multitude of distinct ideas may vary from time to time among different races, among different tribes of the same family, or even between different generations of the same tribe. For instance, the numerals may be expressed by a variety of different combinations, referring to the fingers and toes in various positions or to the actual numbers whereof the particular number may be composed. A single Indian word, or what passed for a single word, may convey a great multitude of ideas, and may seem, therefore, to exhibit the comparative simplicity of the language. What it really proves is its extreme complexity and inconvenience in use, since of the ideas expressed one half may be practically irrelevant or indifferent, as, for example, the gender of the agent and of the object, the animate or inanimate character of either, and so forth. Yet the nature and structure of the language requires that each of these irrelevant facts shall be implied in the form of the sentence or agglutinated word. On the system of Indian kinships, too, Mr. Powell has a good deal to tell us, and there are facts related in his book which confirm to a certain extent the views of Mr. Dorman, showing a curious relation between some of the most peculiar of African superstitions and those which are at any rate at the present day current among the remains of a race that seems to have little or no possible connexion with any of the native tribes of that distant continent.

Ploughed Under (3) is another work dealing with the aboriginal American; the story, in the form of fiction, not of any one Indian chief, but of the fate of the surviving Indian tribes during the last fifty years. What that fate has been we have seen in other works, some of them very recent, that it has been our duty to notice; and the task is so painful, and its effect upon English feeling towards the executioners of the unhappy victims of American aggression so unpleasant, that we do not care to enter again upon such a topic. Enough to say that *Ploughed Under* tells a true story, and certainly does not exaggerate it. It would be impossible to exaggerate the story of the white man's treachery, cruelty, lawless, merciless savagery towards the so-called savages of the United States, because if the simple truth is told, it is impossible, or almost impossible, to obtain credence for it. That such cowardly atrocities, such deliberate breaches of faith, such outrages on humanity, should have been perpetrated by our own near

kindred and sanctioned by a Government which claims to stand in the first rank among the civilized Powers of the world, seems utterly incredible. We feel like Campbell's cherubs, that "we have got among a pack of fiends and not of mortals." From the first landing of the Pilgrim Fathers to the present hour the story is one continuous record of wanton ferocity and unprovoked aggression, of broken treaties, of persevering, consistent, utterly merciless persecution.

The Financial Report of the Secretary of the Treasury for the year 1880 (4) contains many interesting and important facts, but few so generally interesting to English readers as to find a fitting place in purely literary notices. Perhaps that part of the Report which will most attract the notice of the English public is that which deals with the attempt to coin a fixed quantity of silver dollars under a recent Act of Congress. One half of these, it seems, remain permanently in the Treasury; what are forced into circulation speedily return in exchange for paper which can be exchanged for gold. And this for the simple reason that Congress has ordered the silver dollar to be coined on an assumption notoriously false. Its weight and fineness are fixed on the assumption that sixteen ounces of silver are worth an ounce of standard gold, whereas the real equation is 1 to 17½. So long, therefore, as convertible paper can be obtained at the rate of 16 for 1 and exchanged for gold worth 17½, the silver coin inevitably returns to the Treasury. Should this exchangeableness be done away, the only result, as the Secretary points out, would be the demonetization of gold, since no one would pay 17½ dollars in gold where the value of sixteen gold dollars in silver would be a legal quitance of his debt.

Mr. Bascom's treatise on the *Science of Mind* (5) is as drily and tediously technical as other metaphysical works to those who consider metaphysics as in the main a science of merely verbal distinction, and where it deals with apparent realities, dealing with facts of consciousness respecting which every second man's consciousness contradicts his neighbour's. For those who believe in metaphysics as a real science it will probably have the attraction of comparative, if not actual, novelty; some, at least, of the author's views being apparently in closer accord with those of a former generation than with the stricter and more materialistic doctrines at present chiefly in vogue.

The Student's Dream (6) is a declamation or rhapsody—we can give it no more complimentary name—upon one or two of the knottiest problems of the border-ground between metaphysics and theology. It can hardly enlighten anybody, and we can hardly understand with what purpose it has been written and published. It is neither prose nor poetry; neither practical philosophy nor palpable and intelligible caricature.

Miss Mary D. Brine publishes her poems (7) in a volume so elaborately printed and got up that it requires a pasteboard box to keep it in condition. It would be a very suitable ornament to the toilet table of a lady of literary tastes, especially if she did not run any risk of soiling the ample margins, or wasting time and attention that might be more appropriately given to her own hair and colour, by any needless study of the text. Apparently the author has justly estimated the value of the latter, and has determined to give her readers something for their money. This may seem severe. The reader who opens the book at a venture will not read a dozen lines aloud without being fully satisfied that we are not only just, but merciful. The name of E. Foxton is unknown to us, though a claim to the authorship of three previous works is attached to it. It may be that of a lady or a gentleman, a leisurely littérateur, or one whose verses are the amusement of a busy life. At any rate, *The Chapel* (8) was worth writing, and is worth reading by those who have plenty of time and not very much to do with it. The verse is fair, the thought is generally grave and good; neither is striking or memorable.

Perhaps Mr. Murrey's collection of valuable cooking receipts (9) is at least as valuable as any other of the volumes on our present list; but, like some of the rest, it is hardly literature. The author's experience may serve as a voucher for the correctness of his recommendations, and the probability that they will please those to whose taste the cookery of American hotels and restaurants is suited. We must beg our readers not to interpret the latter phrase as if we had spoken of the like institutions in this country. There are tastes, and tastes entitled to some degree of respect, to which the cookery of the higher class of hotels—at least in the Northern States—seems worthy of more attention, and somewhat greater leisure, than is commonly bestowed upon its results.

The *North American Review* contains a vindication of the Mormons by one of themselves, which is, as such, worth reading.

(4) *Annual Report of the Secretary of the Treasury on the State of the Finances for the Year 1880*. Washington: Government Printing Office. London: Trübner & Co. 1880.

(5) *The Science of Mind*. By John Bascom, Author of "Philosophy of English Literature," &c. New York: G. P. Putnam's Sons. 1881.

(6) *The Student's Dream*. Chicago: Jansen, McClurg, & Co. 1881.

(7) *Madge, the Violet Girl; and other Poems*. By Mary D. Brine. New York: G. W. Harlan. London: Trübner & Co. 1881.

(8) *The Chapel; and other Poems*. By E. Foxton, Author of "Herman," &c. New York: G. P. Putnam's Sons. 1880.

(9) *Valuable Cooking Receipts*. By Thomas J. Murrey, late Caterer of Astor House and Rosemore Hotel of New York, &c. New York: G. W. Harlan. London: Trübner & Co. 1880.

The Latter Day Saints, it would seem, have not much to urge in vindication of their institutions; but are prepared to dispute, and not without a show of plausibility, many of the most generally accepted items of the historical and practical charges brought against them, and generally received as unanswerable, if not silently admitted. The current number of *St. Nicholas* will be as acceptable to children as usual, and we need hardly say more in its favour.

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

THE UNITED STATES.

The Annual Subscription to the SATURDAY REVIEW, including postage to any part of the United States, is £1 10s. 4d., or \$7 58 gold, and may be forwarded direct to the Publisher, Mr. DAVID JONES, at the Office, 38 Southampton Street, Strand, or to Mr. B. F. STEVENS, American Agency, 4 Trafalgar Square, London. International Money Orders can be sent from any office in the United States, and Subscriptions, payable in advance, may commence at any time.

PARIS.

Copies of the SATURDAY REVIEW may be obtained every Saturday of M. FOTHERINGHAM, 8 Rue Neuve des Capucines.

The SATURDAY REVIEW is duly registered for transmission abroad.

The publication of the SATURDAY REVIEW takes place on Saturday Mornings, in time for the early trains, and copies may be obtained in the Country, through any Newsagent, on the day of publication.

Nearly all the back Numbers of the SATURDAY REVIEW may be obtained through any Bookseller, or of the Publisher, at the Office, 38 Southampton Street, Strand, W.C., to whom all Communications relating to Advertisements should likewise be addressed.

Copies of the SATURDAY REVIEW Bill of Contents will be forwarded every Friday Evening by post, prepaid, to any Newsagent in Town or Country on application to the Publisher.

Now ready, VOLUME L., bound in cloth, price 10s. Cloth Cases for Binding all the Volumes, price 2s. each. Also, Reading Cases, price 2s. 6d. each. May be had at the Office, or through any Bookseller.

IRELAND AND CONSERVATIVE CRITICISM.

THE very serious and alarming intelligence which has been received from Ireland during the last few days may be said to have, in a certain degree, thrown the Land Bill itself into the background. Thanks chiefly to the action of the less well-counselled of the Roman Catholic clergy, the famous measurable distance seems at last to be over-stepped. Reticent as Mr. CHILDERS has been about the events at New Pallas, the main facts seem not to be doubtful, and a renewed expedition of all arms is announced against the "Castle." In Clara a regular fight has occurred, in which the police were fired on from houses as they advanced up the street. The agents of the Property Defence Association, in the discharge, not only of a business perfectly legal, but of one which will continue to be perfectly legal even when the Land Bill has become law, have had to be protected by something like a battalion of infantry, and to be harboured and supplied with the necessities of life at the barracks. Finally, a natural, but most dangerous, spirit of resentment is said to be growing up among the troops, who are tired of being stoned and mobbed and bludgeoned with iron bars while they are not permitted to retaliate. In short, the result of the mismanagement of the Government is rapidly becoming intolerable, and they might themselves be relieved if they were brought out of their difficulty by an open revolt. They have coaxed and irritated, negotiated and fought, suppressed and encouraged by turns, until the whole business has got out of their control, even if they wished to control it, and the necessary whiff of grape shot when at last they make up their minds to it will in consequence have to be rather a blast than a whiff. One thing would of itself convict the Government of the worst mismanagement. It is notorious that the Irish Roman Catholic clergy were long reluctant to throw in their lot with the movement; it is equally notorious that a large section of them have now done so. This can only be due to the effect produced by Ministerial vacillation, and by the hopes which that vacillation has excited.

Meanwhile the Land Bill itself has been making a languid progress quite in keeping with a measure in which, as Sir STAFFORD NORTHCOTE has said very pithily, not ten men on either side of the House believe. The amendments are in process of consolidation, and two or three divisions have been taken heavily in favour of the Government. It is, however, noteworthy that in almost every case the question mooted will turn up again at a later stage, and that the defence which Mr. GLADSTONE has made against the attack has been much more undecided and much less uncompromising than the tone of his observations some weeks ago. He has receded in his own peculiar fashion from the doctrine he recently seemed to advance that the whole surplus value derived from competition belongs to the tenant. This was in his reply to Sir R. CROSS. The night before, in replying to Mr. BRAND, he had made an admission which in the mouth of a politician less given to the use of the *distinguo* would have been of the greatest importance. "Decidedly," he said, "if the landlord had bought the tenant-right he ought to have it." Now most lawyers notoriously hold that, in future, if the landlord buys the tenant-right he is not to have it; while hardly any one denies that the Bill as it stands would put certain land-

lords, be they many or few, in the same position at the present time. A new clause is, however, promised, which is in some undefined but certainly partial way to deal with this question. Movements of this kind may or may not indicate a genuine disposition to compromise. The obstinate refusal to define tenant-right is still maintained, and the House is thus in a manner asked to award it does not know what to it does not know whom. But it is very noteworthy that the PRIME MINISTER's own supporters are telling him that English Liberals are getting tired of the Land Bill, that the BRADLAUGH incident has weakened the allegiance of not a few of them, and that "an appeal to the country might be of very doubtful expediency." Nor are the most numerous or the most important amendments on the paper by any means the work of the Conservative party. A measure which is in this predicament, which is weakly defended, about which no one is enthusiastic, depends entirely for its chances of success on the mere brute fidelity of a party majority. It is well known how such fidelity, when it is not supported by conviction from within or pressure from without, is wont to be shaken by repeated divisions in Committee.

When matters are in such a condition the attitude of the Opposition becomes a matter of special interest, and during the past week both Opposition leaders have expounded that attitude. Lord SALISBURY's speech at Willis's Rooms must have undeceived those who either from want of understanding or haste had affected to see evidence of rashness and an intention to provoke a dangerous quarrel in an earlier utterance of his. The most jealous critic of the House of Lords would have found it difficult to find fault with Lord SALISBURY's expressions on this occasion. Only those who, with a confusion of ideas which may or may not be honest, mix up their desire to get the Land Bill through with their desire to stir up enmity against the Upper Chamber, can deny that criticism and, if it thinks fit, alteration, of such a measure as the Land Bill are not merely the right, but the duty, of the Upper House. The distinction, too, which Lord SALISBURY drew between the confirmatory and the confiscatory portions of the Bill must be evidently legitimate to all who do not take Mr. GLADSTONE's utterances as a final explanation of everything. But perhaps the most important part of the speech was that in which the speaker adroitly intimated that the importance of the Land Bill was, after all, capable of exaggeration. There are persons, no doubt, who have kept their heads in this matter. But, as it has been the habit of the extreme partisans of the Government to argue an immediate return of SATURN's reign (except in the matter of political economy) in Ireland as a consequence of the Bill, so some extreme opponents of the Government have spoken as if the measure would at once hand over the soil of Ireland to the tenants. Probably the greatest danger of it is that it will do neither of these things. It will put money in the purse of the present tenants; it will take that money out of the purse of the present landlords. But it will do and can do nothing to allay the causes of Irish distress, though it may do something to aggravate them. Sir STAFFORD NORTHCOTE in his Manchester speech took up this latter contention, and may be said indeed to have established it. The analogy of the feverish or dropsical patient which he used is of course sufficiently hackneyed, but it is for once absolutely in place. But neither Lord SALISBURY nor Sir STAFFORD NORTHCOTE advocated a direct resistance to the Bill, for the very

reasons which have again and again been pointed out. Thanks to the Government, something must be done to Ireland, and the Opposition are not in a position to dictate what the something shall be. They can only try to minimize the harm and increase the good of the Bill as much as they can. They are not responsible for the disease, and they have not been called in as physicians by the patient. Yet, at the same time, it would be absurd to overlook the fact that a comparatively slight development of the present state of things in Ireland might alter the situation in a very remarkable way. The scattered sparks of civil dissension may break out at almost any moment into a widespread conflagration. With that conflagration there would be two ways of dealing. One of them may be called the Transvaal method—that of yielding to force and calling the concession magnanimity. The Land Bill might be altered in Archbishop CROKE's sense, arrears of rent might be wiped off with a stroke and so forth, while the present system of half- or rather quarter-hearted coercion was continued. It is doubtful, however, whether it is yet safe to try this so near home. The foreign example has not been relished even by Liberals; and the discontent which, we are told, Liberals feel at the state of Ireland will hardly be cured by such a method. The other plan—the adoption of vigorous, sudden, and concerted action for re-establishing in Ireland the obedience due to the law; the suspension of all concessions until the re-establishment is effected—would set the Radicals in open revolt, and could, indeed, hardly be carried out by the present Government under any circumstances. These contingencies are, indeed, contingencies only, but they have to be taken into consideration, and that consideration no doubt accounts for the attitude of hostile, but not uncompromising, criticism which the two leaders of the Opposition have adopted and supported by arguments different indeed, but mutually complementary.

THE TRANSVAAL.

EITHER the Government knows little of the progress of negotiations in the Transvaal, or it has nothing satisfactory to communicate. The task imposed on the English Commissioners is more difficult and complicated than any ordinary diplomatic transaction. It is uncertain whether the representatives of the Boers, even if their good faith may be trusted, have sufficient authority to bind their supposed constituents. From the nature of the case they could not have been regularly elected, and, according to prevalent rumours, their more turbulent countrymen are prepared to repudiate any unpalatable settlement. The leaders have hitherto been either unwilling or unable to keep their own distinct promises. The murderers of Captain ELLIOT, though they are well known, have not been brought to justice, but the guns which were treacherously captured at Potchefstroom have at last been restored. The place itself is about to be re-occupied, though it seems strange that Sir EVELYN WOOD should venture to expose a new garrison to the risk of such misadventures as those which befel their predecessors. As long as the negotiations continue it must be assumed that a definite and intelligible solution is still possible. Sir HERCULES ROBINSON and Sir EVELYN WOOD, though they are probably controlled by stringent orders from home, would scarcely condescend to prolong a fictitious discussion if they had ascertained that the leaders of the Boers were determined to make no reasonable concession; yet there is little hope of providing either security or compensation for the loyal inhabitants of the Transvaal, and the Boers will be reluctant to surrender the parts of their nominal territory which are principally occupied by native tribes.

The claim of the English and Dutch settlers who recognized the annexation is stronger than that of the natives. The formal declarations of Sir GARNET WOLSELEY, which were afterwards ratified and renewed by the Home Government, justified the confidence of those who invested their capital and employed their industry in reliance on the maintenance of English sovereignty. Liberal eulogists of the policy of the present Government assert that the English inhabitants of the Transvaal are selfish adventurers, not always of unblemished character, who have migrated into the province for the purpose of making or improving their fortunes. It is highly probable that they may

not all be models of disinterested virtue, for persons of regular habits are not prone to doubtful and hazardous enterprises. The settlers in the remote Western States of America, the Frenchmen who seek their fortunes in the Algerian interior, might perhaps be equally unable to bear a strict investigation into their characters; but, if external danger threatened, the American or the French Government would not have to inquire whether their citizens had a personal claim to protection. The English population of the Transvaal probably resembles that which has spread the language of its country over a large part of the globe. The Home Government has often attempted to escape the obligation of following with protection and control the first founders of colonies which have afterwards expanded into great and flourishing communities. Forty years ago, the first settlers in New Zealand were often reproached with the unauthorized enterprise which had imposed fresh burdens on the mother-country. The English inhabitants of the Transvaal must be defended against injustice, first because they are Englishmen, and also on the ground that they had a right to rely on official assurances. Some of them have already thought it prudent to abandon their new homes. Others may, perhaps, if they are exposed to persecution, prove troublesome neighbours to their oppressors; but the Government is right in offering no encouragement to Englishmen who may be inclined to excite the warlike passions of the natives. The COLONIAL SECRETARY has ordered the dismissal of an officer who expressed in a report to his superiors his wish to join the Swazis in a possible war with the Boers.

The native tribes, though they are believed to be unanimous in their preference of English allegiance, have probably been only in a few cases directly affected by the establishment or withdrawal of Imperial rule. During the interval between the annexation and the successful rebellion by which it was terminated, the colonial authorities were too fully occupied to meddle with the questionable relations between the Boers and the natives. A partisan of the Boers not long since triumphantly challenged the English administrators to prove that they had liberated a single slave, or that they had checked the practice of kidnapping native children. The natives were nevertheless well convinced that the maintenance of English sovereignty would involve both the suppression of slavery and the general discouragement of aggression on the part of the Boers. They must now reconcile themselves as they may to the disappointment of well-founded hopes; but there is no reason to believe that they have incurred any positive loss. Their hostility to their habitual enemies seems to be unabated. Some of the chiefs are said to have armed in support of the Government during the brief war; and it is said that the Boers have lately organized an expedition for the punishment of a large tribe. It is not a little remarkable that the heavy blow which has been inflicted on the military reputation of England seems not to have produced any disposition to revolt against Imperial supremacy. The enemies whom the native chiefs principally dread are also the enemies of England. When the negotiations are concluded, and when the army now quartered in Natal is dispersed, it is not improbable that there may be native risings in the Transvaal, and it is also possible that the insurgents may find allies or leaders among the English sufferers from the restoration of the Republic. The agitation which has been caused by the English reverses has extended to Zululand. The well-known adventurer JOHN DUNN, now one of the chiefs among whom the country was divided by Sir GARNET WOLSELEY, expresses a fear, which is probably shared by his neighbours and colleagues, that the English protectorate may be withdrawn, with the inevitable result of destroying the actual settlement. Perseverance for a fortnight or three weeks in the Ministerial policy of bloodguiltiness might perhaps have prevented the commencement of an era of anarchy and war.

No recent information has been received as to the political condition of the Cape. The new Ministry which represents the preponderance of Dutch influence will probably be supported by the constituencies; and it will be anxious to conclude peace with the Basutos. For the present the war is suspended, though it is not formally terminated. Lord KIMBERLEY declines to express any opinion on the plans of settlement; and Sir HERCULES ROBINSON is for the time unavoidably detained in Natal. It is not likely that active hostilities will be renewed. Both

parties have found that the war was burdensome and unprofitable; but, on the whole, the Basutos are so far the winners that they have averted the disarmament which they originally resisted. Mr. SPRICE might perhaps have retained power for some time longer if he had not committed himself to the mistaken policy of the Basuto war. It might have been politic to deprive the natives of arms if he had been secure against resistance; but it was an error to incur the burden of war merely for the purpose of rendering insurrection difficult. The only advantage which has accrued to the colony has been the satisfaction of asserting its practical independence. The contest has been conducted wholly by means of colonial resources; and every occasion has been taken to warn the Home Government that it would not be allowed to interfere with the result. The rejection of Imperial control by the colonies which have obtained the privilege of responsible government is so far expedient that it is unavoidable. It was indeed doubtful whether the Cape, with its rival white races, with its native population, and its vicinity to independent tribes, ought not to have been administered for some time longer as a Crown colony; but the concession of administrative independence, rightly or wrongly made, is, in its nature, irrevocable; and up to the present time it has not produced in the Cape Colony any disastrous consequences. The English and Dutch sections have succeeded to power alternately; and the policy practised to natives within the limits of the colony has, except in the case of the Basutos, been moderate and successful. It is asserted that the Dutch population of the Cape would have displayed active disaffection if the Transvaal war had continued; but up to the present time there has been no disturbance. As the project of federation is indefinitely suspended, there seems to be no pretext on which dissensions between the Government of the Cape and the Colonial Office are likely to arise.

M. GAMBETTA AT CAHORS.

A VISIT like that which M. GAMBETTA has been paying to Cahors is necessarily open to some ridicule. To modern eyes all civil pageants look a little silly, and M. GAMBETTA's progress had to be very civil indeed. It was impossible for him to give it a military air without running the double risk of exciting German suspicion and alarming the French peasantry. It is true he uncovered a monument to the soldiers of 1870, but he did it with a speech which might have been made at an English Volunteer dinner, and have introduced the toast of "Defence, not "Defiance." When a king goes about among his subjects there is nothing unnatural in his being surrounded by as many soldiers as can be got together. They are specially his soldiers, and they are enlisted to make a show in time of peace almost as much as to fight in time of war. But when the President of one of the Chambers employs himself in the same way there is no obvious reason why guards should be turned out and troops be presenting arms at every step he takes. If the Republic were on better terms with the Church, the clergy would gladly have filled up the gap. Beneath the cathedral vault, and amidst the gleam of tapers and the smoke of incense, ecclesiastical splendours seem quite in keeping. They are traditional; they date from a time when men had a natural eye for effect and grouping; and continuous custom has prevented the elaborate ceremonial from seeming foolish to those engaged in it. It is true that M. GAMBETTA, even if he had been the best of Catholics, would have had to content himself with his black coat. The long list of ecclesiastical vestments contains none that are specially set apart for distinguished politicians. But even the black coat, though it does not look imposing in a procession, takes a borrowed honour from the fact that all this display is got together to do honour to its wearer. As it is, we read the accounts of M. GAMBETTA's journey without being reminded of anything more imposing than a rich dowager travelling homewards with her valet, her doctor, and her poodle, and, perhaps, receiving an address of welcome from the corporation of the town in which, as Mr. DOD would put it, she "has influence."

M. GAMBETTA found himself at another disadvantage as compared with kings and emperors. Either there are no stories in circulation about their early lives, or those who knew such stories think it more prudent not to tell them. M. GAMBETTA could not hope for exemption on

either of these grounds. He is too famous not to have already become a legendary hero in his birthplace; and though he is figuratively the master of many legions, they do not inspire such instant terror as the real legions which surround a real monarch. Consequently, the newspapers gave themselves up for days before the visit was paid to wonderful anecdotes of M. GAMBETTA's precocity, and of the marks of future greatness which were visible in him from the very beginning. He had read history as a boy, and forthwith the study became invested in the eyes of many adult Frenchmen with an interest it had never possessed before. An essay of his had been honoured by a *proxima accessit*, and, under the kindly influences of subsequent greatness, that *proxima accessit* has become the most magnificent of prizes. We tremble for the future of the professor who betrayed by his too conscious demeanour his recollection of having occasionally punished M. GAMBETTA for breaches of discipline. How will he ever venture to inflict a penalty again when the effect will be to place the offender, at least in his own estimation, on a level with the President of the CHAMBER OF DEPUTIES? It is true he will be able to quote M. GAMBETTA's exhortation to the students not to be idle or undisciplined, as he was. But in this case, if ever, example may be expected to be more powerful than precept. The boys of Cahors will be more inclined to emulate M. GAMBETTA's glorious disobedience than to follow his decorous counsels. It might not have been unpleasant to M. GAMBETTA to revisit the scenes of his childhood in this heroic and imposing fashion if there had been no Paris criticism in the background. But the certainty that out of every one of the interesting incidents thus recovered from the past some material for satire would be distilled must have been a woful drawback to M. GAMBETTA's enjoyment. Behind the admiring crowd he must constantly have seen the spectral staff of the *Figaro*, and heard the malicious laugh of its readers through the choirs of the most applauding crowd.

Yet, when all allowance has been made for the touch of absurdity which is inseparable from occasions of this kind, it is indisputable that M. GAMBETTA's journey has been a very great success. It marks more completely than anything that has yet taken place, his severance from the *Extremes* Left. For a long time past there has been in all his speeches an obvious endeavour not entirely to break with them. This is probably the explanation of that whole series of inflammatory utterances which began with "*Le cléricisme c'est l'ennemi*." Here was the one chance of finding a common ground on which M. GAMBETTA and those who had once believed in him could agree to act. There is not a trace of this feeling in the speech which M. GAMBETTA made at Cahors on Saturday. All the disturbing ideas with which his name has been from time to time associated have disappeared. All thought of rivalry with M. GRÉVY has been put aside. M. GRÉVY's past is "the pledge of his present, and constitutes the security of the future." The peasant is set up as the ideal of French greatness. It is his robust common-sense that has established the Republic, and it is his interests that the Republic—so long, at least, as it is animated by M. GAMBETTA's spirit—must have nearest its heart. The Constitution may be imperfect, but it must not be improved too hastily. We seem almost to hear M. GAMBETTA giving utterance to the sentiment which once shocked Mr. ARNOLD, that an institution is not the worse for being an anomaly. The precedent for France to follow is that set by the United States, where the Constitution is regarded almost as sacred, and is not subjected even to the slightest amendment except under the pressure of an irresistible popular concourse. More wonderful still, M. GAMBETTA very nearly went the length of exclaiming "Thank God, we have a House of Lords!" The Senate has not yet accomplished its revolution; but, when it has been completely renewed, the country will be astonished to find how great a blessing it has been undervaluing. "Who knows," M. GAMBETTA asked, "whether it may not become at a certain moment our supreme resource?" What the President of the CHAMBER meant by this, or whether he meant anything, must remain for ever uncertain, for no authentic record remains of it. The words were suppressed in the report forwarded to the Paris papers, and M. GAMBETTA asked the local journalists to do him the same service. It is clear, however, that a man who, even in the moment of his greatest excitement, is not betrayed into anything more revolutionary than im-

prudent praise of a Second Chamber has sown his political wild oats. M. GAMBETTA's enemies say of him that he has turned forty, and has grown rich and fat. But this is only an uncivil way of putting the very important fact—the most important of all facts perhaps for France at this moment—that years and prosperity have left their mark on him, and that he feels stealing over his soul the soothing influences of that practical Conservatism which has its root in contentment with things as they are.

The one thing that comes out most clearly, both from this speech and from the opposition offered by the Cabinet to M. BARODET's proposal to revise the Constitution, is that M. GAMBETTA has elected to be Prime Minister rather than President of the Republic. If M. GAMBETTA had come to the opposite conclusion, he would naturally have desired to see the President elected directly by the people. Wherever he is so, he necessarily becomes the representative of the nation in a greater and more conspicuous sense than any in which the Chamber of Deputies can be called its representative. He is the offspring of an immediate and simultaneous vote. He and his policy are submitted to the national judgment, and if they are accepted they necessarily take precedence in the minds of the electors of the crowd of deputies who have been returned on all manner of cross issues. Perhaps if the President had been elected by the people M. GAMBETTA would not have cared to abolish the *Scrutin d'arrondissement*. The more obscure and impracticable the Chamber became the more striking the figure of the President would have looked by its side. The praise of M. GRÉVY in the speech at Cahors on Saturday and the determination of the Cabinet to oppose any modification of the Constitution are unmistakable indications that M. GAMBETTA has made up his mind to rule through M. GRÉVY and not instead of him. In this way he will at least reap the advantage of having a second string to his bow. After being Prime Minister under one Constitution he may be President of the Republic under another.

MR. BLENNERHASSETT ON MINORITIES.

MR. BLENNERHASSETT, who has often shown a desire, not universal among Irish members, to contribute to useful legislation, lately raised a short discussion on Mr. HARE's scheme, and on other more or less ingenious contrivances for securing representation to minorities. On former occasions more zealous supporters of the democratic cause have expressed similar opinions. Mr. MILL, with laudable candour and with characteristic want of practical insight, was an earnest advocate of Mr. HARE's puzzle. Mr. FAWCETT and Sir CHARLES DILKE have maintained the claim of minorities to power proportionate to their numbers, though political issues must generally be determined in one of two incompatible forms. There is no reason why a majority, however small, should in ordinary cases submit to a compromise; but it is undoubtedly desirable that there should be an Opposition strong enough in numbers to command attention to its remonstrances and warnings. Mr. BRIGHT and Mr. CHAMBERLAIN understand better than their more tolerant allies the principle and spirit of government by numbers. If the multitude is fit to exercise supreme and irresponsible power there is no reason for hampering or limiting its authority. Mr. BRIGHT has since the question was first raised denounced with consistent vehemence every project for the protection of minorities. Having been all his life on the side of the majority, he sees no reason for throwing away the advantages of his position. Mr. CHAMBERLAIN has been the principal author of an organization which is well adapted to its purpose of excluding the upper and middle classes, with the exception of a few popular leaders or demagogues, from even the smallest share of political, municipal, or parochial representation. In his model town of Birmingham those inhabitants who refuse to swallow the Liberal test are subject to an excommunication more complete than that from which Roman Catholics were relieved fifty years ago. No despotism is so pitiless as that of demagogues administering power vested in the populace.

Mr. BLENNERHASSETT will vote, when the opportunity occurs, for the extension of the suffrage to householders in counties; but he probably regards the approaching change with little enthusiasm, as he proposes partially to counteract its natural results. The claims of flesh and

blood, on the man on the other side of the hedge, though they may seem irresistible to an admirer of theoretical uniformity, suggest to timid politicians the probability of oppression and spoliation; but it seems absurd to admit a mass of doubtful or dangerous voters, and then to take elaborate precautions against the result. Even if the sovereign populace could be cajoled into a prudent surrender of its supremacy, artificially protected minorities would hold their privileges at the mercy of their condescending benefactors. The greatest advantage of the historical Constitution which is now gradually disappearing was that it casually provided unequal and dissimilar constituencies which produced a variety of representation. That Mr. MACAULAY or Mr. LOWE, sitting for the little borough of Calne, should outweigh a score of members returned for large manufacturing towns seemed not to be an anomaly when it was made possible by ancient and unquestioned arrangements. The deliberate division of the representation of Manchester between the majority and the minority shocks the intelligence of many politicians who are less violent partisans than Mr. BRIGHT. If, after the next degradation of the franchise, a machinery devised for the protection of minorities should be found temporarily effective, it would be easily and certainly destroyed by the acknowledged rulers of the country. Popular orators would contend with irresistible force that when the supreme right of the working classes was once recognized, it would be inconsistent with sound doctrine and with practical convenience to fritter their sovereignty away. The recent precedent furnished by the French Chamber is almost conclusive. The election of single deputies by *arrondissements* made openings for personal influence, for local peculiarities, and generally for the representation of minorities. The *Scrutin de liste* will, in the language of its advocates, exclude provincial favouritism, and compel or enable an entire department to return a batch of members chosen only for their political opinions, and probably representing in almost every instance the dominant party. M. GAMBETTA has accomplished at a stroke the feat to which on a smaller scale Mr. CHAMBERLAIN has long devoted his energies. The next French Chamber will not be so completely purged as the Birmingham Corporation; but it will contain an overwhelming number of advanced Republicans. It is doubtful whether the House of Commons a dozen years hence may not hold still more extreme opinions.

A provision of bladders or air-belts on the eve of immersion in deep water may to Mr. BLENNERHASSETT and other respectable politicians seem a judicious precaution; yet the safer plan would be to remain on dry land instead of making a gratuitous plunge. Lord DERBY's avowal that he was taking a leap in the dark was thought to be more cynical than statesmanlike. Since his time sufficient light has been admitted to show the depth of the abyss. The extinction of the suffrage may perhaps not be immediately followed by the adoption of the *Scrutin de liste*, for it may be expected that for the present constituencies will only return two or three members apiece; but in every electoral division the majority will consist of recipients of weekly wages, who will be urged by managers of the Birmingham type to vote exclusively for candidates of extreme opinions. It will perhaps be desirable that professional manipulators of elections should, as in the United States, hereafter supersede fanatical demagogues. A Republican or Democratic politician neither entertains strong prejudices nor appeals for the most part to the passions of voters. The machinery of American representation is too regular in its operation to allow the intervention of disturbing forces. It has also been often shown that the institutions of the United States include many checks and balances which are unknown in England. The retention by the several States of most of the functions of government greatly reduces the sphere of the political activity of the President and of the Congress. Again, the Senate which is not chosen by popular election is more powerful than the House of Representatives, and the President is for many purposes independent of both. The sovereignty of Parliament once administered by the democracy will be irresistible.

Proposals for the protection of minorities are only interesting as admissions of the danger which is about to be deliberately incurred. The special objections which are urged to various schemes for rendering popular legislation comparatively innocuous would be deserving of attention if it were probable that democracy would abdicate on

the morrow of its accession. English Radicals are as intolerant as French Republicans, who threaten the Senate with extinction if it presumes to oppose the will of the Chamber. The House of Lords, which still possesses a certain independence, uses its remaining power to obtain a hearing for minorities. Modern institutions devised for a similar purpose would be far more easily swept away. There can be little doubt that Mr. HARE's complicated arrangements would facilitate the election of a certain number of members interested in petty crotchets and representing zealous factions. Whether any serious disadvantage would result from the presence in the House of a few enthusiasts for the diffusion of small-pox or other diseases is perhaps doubtful. It is a more certain, though perhaps not a graver, inconvenience that in the familiar case of three-cornered constituencies the death or resignation of the members of the minority makes room for one of the opposite party. It is perhaps useless to deprecate changes which appear to be inevitable. The combination of physical force with political sovereignty is dangerous to freedom and to property; but the same reasons which show that the supremacy of the multitude is objectionable also prove that, under certain conditions, it is irresistible. Those who have precipitated the transformation of the old Parliamentary system have done but questionable service to the country. Mr. GLADSTONE many years ago expressed a theoretical approval of universal suffrage; but it was in his absence that Lord HARTINGTON unnecessarily pledged the Liberal party to the establishment of a uniform franchise. Mr. BLENNERHASSETT wastes his energies in dealing with the fringes of democracy.

THE CIVILIZATION OF THE EAST.

THE West has for years been occupying itself with the civilization of the East; and, as all Mahomedan countries are alike, we may include in the East those territories on the northern shore of Africa which are Eastern in everything except geography. Sometimes the process goes on slowly, as in Egypt; or falls for a time into abeyance, as formerly in Turkey; at other times it goes on by leaps and bounds, as in Tunis. But, wherever it works, it always works by the same methods. There are three great instruments of civilization—arms, law, and money; and civilization, if it does anything, is always using one or more of these instruments. Usually money is the instrument first used. We traded with India before we conquered it. France lent Tunis a little money before she invented the Kroumirs and encircled the palace of the BEY with her troops. The last Khedive got seventy millions sterling out of the West before he was deposed in the interests of civilization. After some money has been laid out to prepare the way for arms, or for that display of irresistible force which makes the actual use of arms unnecessary, more money is poured in to help and establish civilization. There is no end to the beautiful things which French money is going to do in Tunis now that the BEY has been brought to his senses; and since the Joint-Protectorate has been put into a regular and permanent form in Egypt, Western money has been flowing into the Valley of the Nile to an almost embarrassing amount. The Egyptian banks complain that they can hardly do business in any satisfactory way, as so keen is the competition to lend that the difficulty in Egypt is now not to find lenders, but borrowers. Money is even forced on the Egyptians which the Egyptians do not wish to take. The indefatigable, the universal M. DE LESSEPS insists on making a fresh-water canal to Port Said which the Egyptian Government considers to be unnecessary. This is to M. DE LESSEPS the most foolish of objections. Is a man who is piercing the Isthmus of Panama, and is just going to pierce the Isthmus of Corinth, to be stopped from making a paltry little fresh-water canal in a country which he considers almost his own? Port Said, a place which he no doubt created, gets its water by the simple agency of a pump and some pipes. This is altogether out of character for a town created by M. DE LESSEPS. A fresh-water canal, all to itself, is the least such a town ought to have, and M. DE LESSEPS is determined that it shall have it. The Egyptian Government refuses its consent, but M. DE LESSEPS knows how to make a proper reply to a Mahomedan Government almost as well as M. ST.-HILAIRE himself. The Egyptian Government says there shall not be a fresh-

water canal to Port Said, and on this M. DE LESSEPS immediately forms a Company to make one. He, metaphorically speaking, first surrounds his Kroumirs, and then he will go to the Palace at Cairo, and give the KHEDIVA two hours to sign a concession. Civilization will make a new little jump forward, and the ridiculous pump and pipes of Port Said will be things of the past. Much the same thing is taking place at Constantinople. A period of pressure, which has just stopped short of being an armed pressure, has come to a temporary end; the SULTAN breathes for the moment freely, but he knows that if he can escape the arms of the West, he cannot escape its money. Civilization is always at his door in one shape or another. For months, or rather for years, he has been plagued by monied Christians, who have been competing for concessions. A deaf ear was turned to all applicants while the struggle to avert forcible pressure was going on. But now civilization comes in another shape, and will have its way. The SULTAN has ordered his Ministers to report on all applications for concessions within the short delay of a fortnight. The order is on the face of it absurd. It is not meant to be carried out, and it could not be carried out. But it has a value and a meaning when it is taken as a sign that the money of the West must flow in to the East, when the time for the operation of this instrument of civilization has come at last.

Besides money and arms, there is law as an instrument of civilization, and perhaps it may be said that, much as the East dreads the money and hates the arms of the West, it dreads and hates its law more. But the West cannot take its arms and its money when it sets out civilizing without taking its law too. We are continually pouring our law as well as our money into conquered India. At first, like M. DE LESSEPS at Port Said, we were content with a pump and some pipes. But long ago we grew more ambitious, and a whole fresh-water canal of English law is continually pouring itself into India. Some persons who know India well think we have been too liberal with our volume of Western jurisprudence, and that, to use the language of M. DE LESSEPS, we have been "irrigating the deserts" of the Indian legal mind too copiously. But some amount of Western law must go in attendance on Western arms and Western money. Centuries ago Turkey was obliged to secure, by the capitulations, the distribution of a special justice to Europeans, and at this moment the civilization of Egypt is even more the civilization of Western law than that of Western arms or money. France and England supply the force which is too irresistible to be used, and the money which the Egyptians have to take whether they want it or not. But all Europe supplies the law, and even the remote United States have a finger in the curious pie of Egyptian jurisprudence. There are many strange things in Egypt. There is the celebrated wooden man, there are the Pyramids, there are the persons who lie down to be ridden over by a saint. But the strangest of all things in Egypt is the presence of a Russian and an American as judges of the Court of Appeal. They are like flies in amber—pretty, no doubt, as specimens, but the mystery is how they ever got there. Russia and America have nothing whatever to do with Egypt. They are not civilizing the land of the PHARAONS by arms or money. But their judges come to Egypt as naturally as if they were attending a Social Science meeting at Birmingham. How it happens that they should be there is a matter of history into which it would be tedious to enter. But that the whole civilized world, including even Spain and Portugal, should unite in importing law into Egypt, is in every way a remarkable and significant thing. It profoundly colours the civilization which England and France impose on Egypt. It gives Germany a standing ground for interference, of which Prince BISMARCK is quite ready to take advantage when he sees fit. It works adversely to the influence of England; for the little nations, instigated, perhaps, by some of the bigger ones, are delighted to use their power of checking the intrusion of English law and limiting the authority of English judges. And it points in no uncertain manner to what must some day happen in Turkey. The West will never cease employing either arms or money to civilize the Turks. Law must some day follow; but all Europe will be interested in having a share in the introduction of law, and, so great will be the conflict of interests, that in all probability those who claim to take their share in working this instrument

of civilisation will have to be pacified by the recognition of their claim.

How Western law comes by a sort of fatality in attendance on Western arms and money is well illustrated by the history of the *Enfida* case, which not long ago occupied so much of the attention of the English and French Governments. It may be recollected that *KHEREDINE BAY* sold a landed estate in Tunis to a French Company; that Mr. LEVY, an English subject, claimed to be allowed to substitute himself as the purchaser in virtue of a right of pre-emption given by the Mahommedan law to an adjoining owner; that *KHEREDINE* tried to elude the claim by reserving a strip of land so that the right of pre-emption should not accrue; and that, while the French Company got possession of the only house on the estate, Mr. LEVY got possession of the land. Mr. LEVY wanted the question to be decided by the local Courts; but the French Government, who took up the case of the purchasing Company, said that the local Courts were not to be trusted, and that such advantages as Mr. LEVY had gained were given him corruptly by powerful Tunisians, who set the natives on the estate against his French rivals, and who had a complete command of the Courts. The English Government did not care to contest this point. They could not bring themselves to say, after all that has taken place in Egypt and Turkey, that Mahommedan Courts can be trusted to do justice. But Lord GRANVILLE fortunately discovered that, under the provisions of a particular treaty, the Consular Courts of France and England in Tunis were competent to decide a question as to land in Tunis arising between an Englishman and a Frenchman. He, therefore, washed his hands of a troublesome question, and pronounced that, if the French Company liked, it might sue Mr. LEVY in the Consular Court of Tunis, whence there would be an appeal to the Consular Court of Constantinople, and thence to the Privy Council in England. For the moment this may do as an answer to Mr. LEVY; but it leaves the main difficulty unsettled. It is the defendant who is to be sued in his Consular Court, and the whole struggle in cases of this kind is to be the defendant, not the plaintiff. If Mr. LEVY is to be the plaintiff, then he must sue the French Company in the French Consular Courts, with an appeal to some tribunal in France. He would be as reluctant to do this as the French Company would be to take the case through the lower English tribunals to the English Privy Council. The coveted position of defendant goes with possession. It is the man who is in possession that is sued in Courts he likes. But possession can only be gained by force or with the concurrence of the native Government. The native Government, therefore, if corrupt or badly influenced, although it is not allowed to decide a case between foreigners, is allowed to do injustice by deciding which foreigner shall have the advantageous position of defendant. Sooner or later it is seen that this is too much to concede to a Government which the Western world regards with contempt or suspicion. There must, it is said, be a tribunal at the spot in which Western law shall prevail, and in which plaintiff and defendant have an equal chance. A little force has to be used to make the Eastern Government acknowledge that the superior kind of justice which feverish meddling Western people like is out of its line, and then Western law has free play, and works in concert with arms and money to civilize one more section of the Eastern world.

BREACH OF PRIVILEGE.

THE House of Commons was enlivened on Tuesday last by a pleasant and instructive little episode. Mr. MITCHELL HENRY complained of a breach of privilege committed by Mr. EGAN, Treasurer of the Land League, in a foul-mouthed attack on the conduct and motives of those Irish members who had, in defiance of Mr. PARNELL's commands, voted for the second reading of the Land Bill. The offender, writing from Paris, accused the seceders of every kind of baseness, including the solicitation of patronage from the Government. They were traitors, they were apostates, and they were sycophants of the Whigs, who are now, as always, "base, brutal, and bloody." The quotation of a phrase of O'CONNELL's might have reminded the House that the indignant EGAN

was only using the language in which Irish patriots have long been used to describe both their enemies and those friends who may differ from them on any political question. As Mr. MITCHELL HENRY observed, the libeller seemed to have supposed that the time, foretold by GRATTAN, had arrived at which the Irish people would return to Parliament the most worthless scoundrels in the country. Mr. A. M. SULLIVAN, with characteristic felicity, rose to order on the assumption that Mr. HENRY adopted the scurrilous phrases which he was denouncing. GRATTAN could not, when he made the speech, have been called to order for a hypothetical anticipation of the distant future. It would be irregular to say and uncharitable to think with Mr. EGAN that the prophecy is at last accomplished; but the incriminated members use equally strong language against their assailant, for whose violence they, not without reason, hold Mr. PARNELL responsible. Mr. O'CONNOR POWER and Mr. MCCOAN, two of the libelled members, have indulged themselves in a reply to the severe critic, whom Mr. MCCOAN, with contemptuous familiarity, designates by the name of "PAT EGAN." He would, he says, have treated the attack "with the contempt with which cowardly and scurrilous insolence is best answered"; but, "as he has reason to believe that it has more authoritative significance than the name of PAT EGAN could give it," he is forced to reply. He proceeds to insinuate that "PAT EGAN" cannot safely be trusted "with the money bags" of the Land League; but, as angry disputants say when they have exhausted their store of abuse, "he is safe from such personal retort from me." Mr. O'CONNOR POWER, with equal vigour, says that "the real blackleg is the cad who bolts with the stakes; and the real coward who, skulking in London or Paris, tries to hide his own poltroonery by impugning the courage of others." "Those white-livered filibusters of the tongue who, like domestic bullies, browbeat their own race, have not a spark of fight in them." Mr. O'CONNOR POWER is careful to explain that his reply is addressed not only to insolent libellers, but to masked abettors, or, in other words, to Mr. PARNELL. In a rejoinder which for the present closes the correspondence Mr. EGAN not only repels the charge of dishonesty, but hints that his only misapplication of the Land League funds has been made for the personal benefit of his present enemies. In an encounter between two loud-voiced fishwomen, there is always a probability that the charges on both sides may be false.

The quarrel is a very pretty quarrel, as it is evident that the combatants on both sides profess to believe that the prophecy of GRATTAN has been partially fulfilled. Members who are, or lately were, active promoters of the Land League loudly accuse of actual or intended embezzlement the agitator whom they had intrusted with large sums taken out of the unpaid rents of defaulting tenants. When they placed themselves under the command of a violent demagogue, they perhaps hoped, in spite of all experience, that they would be allowed to retain a certain independence; but, when a Land Bill is introduced containing concessions to the malcontent tenantry which their wildest hopes could not have embraced, they are politically excommunicated by their leader because they think it prudent to accept the extravagant boon. Having listened with complacency to the shameless invectives which the managers of the Land League have directed against the landlords, Mr. O'CONNOR POWER and Mr. MCCOAN are surprised when the revolutionist leader employs a suitable instrument to hold them up to the hatred of the Irish populace. The first promoters of the French Revolution experienced a similar shock when they were exiled or guillotined by the earlier race of Republicans under the influence of PÉTHION, of BRISSOT, and of VERGNAUD. In another year or two the Girondists were hiding or flying from the murderous animosity of DESMOULINS and DANTON, who were in turn put to death by the arch-assassin ROBESPIERRE. The Government of England is still strong enough to prevent judicial murder in Ireland, but it cannot soothe the passions which find expression in the interesting EGAN correspondence. The advocates of Home Rule, and of the total or partial confiscation of landed property, already hate one another more profoundly than they dislike the English nation, and the gentry and peaceable inhabitants of Ireland.

With questionable tact Mr. GLADSTONE thought it worth while to take part in the discussion by bearing testimony to the admirable qualities of the incriminated

members. He forgot the share which they had taken in Parliamentary obstruction during the early part of the Session, and their participation in the movement which has brought Ireland to the verge of civil war. He seemed especially anxious to connect Mr. PARNELL with the EGAN effusion, for the apparent purpose of rendering the schism finally irreparable. Mr. PARNELL will not fail to remind the rabble which still follows his guidance that his opponents in Ireland are the friends and favourites of the PRIME MINISTER of England. Sir W. HARCOURT spoke boldly and truly, but also with doubtful discretion. Mr. PARNELL will not be inclined to deprecate the use of strong language by statesmen who ought to offer a contrast to the vituperation of demagogues. It is scarcely possible that the Ministers can be blind to the service which the irreconcilable faction does to their cause. Thousands of hasty reasoners will be disposed to think that a Land Bill cannot be wholly bad when it is honoured by the censure of Mr. PARNELL. It would be a loss to the promoters of the Bill if they could persuade or frighten the leader of the Land League into even a provisional approval of their scheme. The suspicion which is generally felt by moderate politicians has not been abated by the auspicious support which demagogues of the type of Archbishop CROKE have given to the Bill. Professed enemies of Irish landlords and of the English connexion are certainly not actuated by justice or generosity when they recommend members who may be under their influence to vote for the Bill. If the extreme faction had swelled the majority on the second reading, Mr. EGAN might have been silenced; but more respectable Liberals would have been still further alienated.

Mr. PARNELL is playing a bold game; and it remains to be seen whether he defeats his adversaries. He has effectually broken up the Parliamentary party, of which he was the chosen leader, by insisting on his claim to be dictator. First Mr. SHAW, Mr. MITCHELL HENRY, and the more creditable members of the Home Rule party disclaimed their allegiance; and since the division on the second reading Mr. PARNELL has scarcely twenty followers in the House of Commons. Mr. HEALY, Mr. BIGGAR, and their like cannot be said to compensate by moral weight for scanty numbers; but it is possible that Mr. PARNELL may still retain his hold on the constituencies. Popular leaders are for the most part found out by their associates and social equals long before they lose the power of misleading the populace. Much greater men than Mr. PARNELL have incomparably more influence with the multitude than in Parliament or perhaps in the Cabinet. The favour of the many as compared with the confidence of the few distinguishes the demagogue from the statesman. Mr. PARNELL, who is a demagogue pure and simple, may perhaps not be less successful as an agitator because he is disliked and feared by his political allies. The EGANS, the DILLONS, and the DAVITS, the Fenians, and other conspirators, the promoters of rebellion and civil war, will adhere to Mr. PARNELL the more closely because he has broken with the comparatively moderate section of the party. The tenant-farmers have been so thoroughly demoralized by the late agitation that they will almost certainly prefer the leader who proposes to them the boldest scheme of spoliation. It is also believed that the American Irish who furnish the Land League with the greater part of its revenue have approved Mr. PARNELL's policy, if they have not been its real authors. The true Amphitryon is he who commands material resources. Notwithstanding the hints and suspicions with which Mr. O'CONNOR POWER and Mr. McCOAN retaliate on their accuser, it is extremely improbable that a large fund should have been placed at the disposal of a dishonest treasurer. In the improbable contingency of the restoration of tranquillity to Ireland in consequence of the operation of the Land Bill, Mr. PARNELL will have no difficulty in persuading his admirers that its strongest provisions were the result of his own more comprehensive demands. In a contest among demagogues the worst almost always wins.

ITALY AND FRANCE.

THE annexation—for such it practically is—of Tunis by France has called the attention of the English public once more to Italian affairs, in which the interest taken by this country has of late years been languid. For

the last five years, ever since the accession of the Left to office in 1876, Italian politics have been more and more of a puzzle to English readers. The Left, in the first place, which then came into power, contained few or none of the names familiar to English readers, the names of the lieutenants and successors of CAVOUR; and the programme of the Left differed, if it differed at all, from that of the Right, which it supplanted, in matters so unessential, so local, and so personal that few readers had either the patience or the opportunity to distinguish between the two parties. On two occasions, however, within this period, the flagging interest of Englishmen in Italian affairs has been revived—first, when the movement in favour of *Italia Irredenta* was in progress; and, secondly, when the recent seizure of Tunis, and the feeling which it awakened in Italy, showed that a new rivalry with France might efface the old enmity with Austria. We pointed out, at the time when the *Italia Irredenta* cry was at its height, that the agitation was manufactured, and that it corresponded neither to the real wishes nor to the real interests of the Italian people; and the longer the Left, which once consisted of Irredentists, ex-Irredentists, and semi-Irredentists, has been in office, the more the suspicions awakened in Austria by its accession to power have been removed. Neither in the Austrian nor in the Italian press is there any more talk on the subject. It is now recognized in both countries that perorations on the subject of Trieste and the Trentino are all very well for Radicals out of office, but do not represent the feeling of responsible politicians of any party whatever. But while the old hostility of Italians to Austria has been cooling, it is important to notice that a new, and probably an increasing, sense of hostility to France has arisen in its place. The enthusiasm felt for France in 1859 did not last long. It was gradually effaced by the opposition offered by NAPOLEON to the completion of Italian unity in 1860, by the cession to France of Savoy and Nice, and by the campaign of Montana. Italian public opinion was not misled by the plea, put forward after the fall of NAPOLEON, that the benefits conferred by France on Italy were the work of the French people, and the injuries the work of the Bonapartist dynasty. It has not been forgotten that the overthrow of the Roman Republic in 1849 was the work of the sister Republic in France, and that the same sister Republic would have been only too glad of a pretext to seize Savoy. Nor has it been forgotten that, whatever France did for Italy, France was well paid at the time. Gratitude and grudges alike count for little in the sentiment with which nations regard one another; what counts is the fact that the interests and aims of two countries agree in the main or differ.

The Austrian rule in Italy prevented Italians, twenty years ago, from doing what the people had set its heart on, and what all modern nations tend to do—from belonging to itself and leading a life of its own. Any alliance which would enable Italy to rid itself of the hated foreigner was accordingly welcome, and the only alliance at hand was that of the French. History will show that throughout this alliance NAPOLEON III., whatever else may be laid to his charge, was more disinterested and magnanimous than the French people; and that, had it not been for the pressure of public opinion in France, he might have left Savoy and Nice to Italy and the Temporal Power to the natural fate which afterwards befell it. However this may be, Italy does not feel itself bound by any memories of past kindness; and, in proportion as the country feels the need of expansion and becomes conscious of its growing strength, it resents the occupation by any other Power of any points of vantage in the new field which it covets for itself. The cession of Cyprus to England awakened, for this reason, a genuine though not permanent feeling of resentment in Italy. And yet Cyprus was only taken as a place of arms. The French occupation of Tunis stands, however, on quite another ground. In the first place, Tunis is much closer to Italy; in the second, Italian trade and Italian political influence have long been competing in Tunis with French trade and French political influence—so much so that Italians have come to look on Tunis as a battle-ground which they cannot abandon without discredit; and in the third place the predominance of France in Tunis is to Italians only a stepping-stone to the predominance of France all over the Mediterranean. The writer of a very able Italian pamphlet

which we reviewed last year foresaw and predicted what has happened this summer; and he argued that, as the supremacy of France in the Mediterranean was a danger to England no less than to Italy, it should be the policy of England to sacrifice the French alliance and to accept that of Italy in its place. We gave in reply the reasons why, on whatever side our sympathies might be, such a change of alliances, with the further changes it would carry with it, was not practically possible. Nevertheless, when the first European complication arises, it will be safe to count on the estrangement between France and Italy as a permanent factor in the problem. The loss of a battle or the loss of a province may be forgotten. There are very few Italians, especially of the younger generation, in whose minds the surrender of Savoy and Nice rankles at all seriously. But no nation with any vitality in it will willingly see itself year by year outstripped and overlapped by another—see the channels it has marked out for its trade and enterprise occupied, and the objects of its ambition and spirit of adventure seized by a neighbour and a rival. The trickery with which the occupation of Tunis was accompanied has aggravated, without doubt, the sense of defeat under which Italy is smarting; but the rivalry between the two countries in Northern Africa is as natural, as inevitable, and as much to be counted on as is the rivalry between England and Russia in Asia.

On this point public opinion in Italy is unanimous. There is no party there which says that French predominance is a bugbear, and that those who wish Italy to be on her guard against it are alarmists. Men of all parties recognize, though they may deplore, the fact that the interests and the aims of the two countries are in opposition. All are agreed that the occupation of North Africa by France hinders the development of Italy on a line in which, but for France, it would naturally tend to move. Commercially, diplomatically, from a military point of view, and from the point of view of national pride and ambition, Italy has sustained a defeat. From the moderate *Opinione* to the democratic *Legge*, there is but one opinion on the matter in the Italian press. The Ministry was so conscious of the defeat inflicted on it that it immediately resigned; and, though the new Cabinet is substantially the same as that which preceded it, and represents the same party, or rather group of parties, in the Chamber, Signor CAIROLI, the ex-Premier and ex-Minister of Foreign Affairs, has no place in it. He was more directly responsible for what had happened than any one of his colleagues, and it was natural that in any changes which took place owing to his policy, he, at least, should retire. The recent crisis in Italy has given fresh evidence of the weakness and confusion of political parties in that country. It will be remembered that only a few weeks earlier the Ministry had undergone a defeat in the Chamber through a coalition of the so-called Dissident Left, headed by Signor CRISPI, with the Right, led by Signor SELLA. These temporary alliances of discontented groups of the Left with the permanently hostile Right have been the means by which all the countless changes of Ministers and Ministries have been brought about during the last five years. During all this time the Left has been in office, and has had a large majority in the Chamber; but at no single moment has there been a Government on whose stability any reliance could be placed either at home or abroad. After this defeat the Cabinet of Signor CAIROLI and Signor DEPRETIS resigned; but as no other party or group in the Chamber was strong enough to form a Ministry, the KING refused to accept the resignation; and the Chamber, finding no new Ministry forthcoming, reversed its former vote, and gave the old one a fresh lease of life. This would naturally have lasted till some new quarrel or intrigue had brought about another such alliance between the ever-watchful Right and any insubordinate section of the Left. The Tunisian affair, however, made this unnecessary, and the Cabinet resigned of its own accord. Signor SELLA was accordingly charged with the formation of a Cabinet. In questions of foreign affairs the Right have admittedly an experience and authority which cannot be claimed for the Left. It was the Right which had been led and taught by CAVOUR, and which was in office from his death till 1876. The Left had come empty-handed away from Berlin, had been forced to eat its own words on the question of *Italia Irredenta*, and had now been duped and surprised by France. Notwithstanding this, Signor SELLA was unable to form a Ministry which the Chamber was likely to accept. Apparently he was also of opinion that an appeal

to the country would not better his position; and, after some days of fruitless endeavour, he abandoned the task, and the bulk of the old Ministry returned to office. The place of Signor CAIROLI as Foreign Minister is taken by Signor MANCINI, who has yet to show his qualifications for the post. Of Signor CAIROLI's capacity in this respect it is unnecessary to speak. Not only do facts speak for themselves, but the surprise will be remembered which was generally expressed when a man, whose temperament, education, and past history combined to disqualify him for so difficult and delicate a post, was rash enough to undertake it. No man of his party is personally more respected than Signor CAIROLI; his honesty, is proverbial in Italy; but honest people sometimes confide too much in the honesty of others, and a too trustful nature is not fitted for diplomacy. It is to be regretted, however, that the failure of Signor SELLA to form a Cabinet of the Right leaves the country exposed to a continued repetition of the Parliamentary intrigues which have been fatal to so many Ministries, and fatal also to nearly all useful legislation in Italy. Both for internal legislation and for the wise conduct of foreign affairs, Italy needs above all things a strong and stable Government, supported by a compact Parliamentary majority; but the chance of this seems now further off than ever.

FISHING GRIEVANCES.

THE House of Commons and a Home Office Commissioner have of late been severally busy in inquiring into certain wrongs alleged to be suffered by fishermen off the East coast of England. It ought not, one would think, to be a very difficult matter to devise some sufficiently conspicuous and distinctive light to be carried by trawlers; but up to this time the Board of Trade has been unable to compass this seemingly trifling undertaking. For something like five years a joint Committee appointed by the Board of Trade, the Admiralty, and the Trinity Board sat to draw up regulations to prevent collisions at sea. All the maritime Powers were negotiated with, and at length, in August 1879, an Order in Council was passed directing trawlers to carry, in addition to side lights, a red light over a green on one of their masts. When this order was put out it was found to be exceedingly distasteful to those who had to obey it. Conferences and Commissions followed, and finally a Select Committee reported last year that trawlers should be excused from carrying either side lights or coloured lights, and should only be made to carry a single white light. This Report seems to have given full satisfaction to the trawling interest, but it has since been upset by a fresh Departmental Committee, which has ordered trawlers to carry a red light on the mast-head and a white light on the after-part of the vessel. This rehabilitation of coloured lights has nearly broken the hearts of the North Sea fishermen. Why they should be so convinced of the impossibility of obeying the direction to carry two lights instead of one, and to have one of them red instead of white, is not very obvious to laymen. But there is no question that they are thus convinced; and on Tuesday Mr. BIRKBECK and Mr. NORWOOD stood up to lay their complaint before Parliament. Thereupon a discussion followed, which had at least the advantage of presenting the President of the BOARD OF TRADE in a new aspect. No one could show himself more familiar with this vexed question of trawlers' lights than Mr. CHAMBERLAIN. First of all, he ventured to throw some doubt upon the perfect impartiality of the Select Committee. Out of its eleven members, seven represented places in which the trawling interest is powerful; so that its Report was naturally determined by its view of what the trawling interest needed. This statement seems to ignore the fact that the Report of the Committee was unanimous; so that the members who do not represent fishing ports must have suffered themselves to be overpersuaded by those who do. The Board of Trade has, in fact, two Reports to decide between—the Report of a Select Committee and the Report of a Departmental Committee—and it has not made up its mind which to choose. It has been represented to the Board that in the question of trawlers' lights there are others than trawlers interested. The trawlers are in favour of what Mr. CHAMBERLAIN contemptuously calls "the present illegal practice" of carrying a single white light at the masthead. But represen-

tations have been made both by foreign Governments and by another class of fishermen, who use the drift net, that trawlers ought to be made to carry some more distinctive light. There are boats, it seems, which are more afraid of running down trawlers than trawlers are of being run down by them. Mr. CHAMBERLAIN is so far from being content with the single white light beloved of trawlers that he appears to hanker after unattainable colours. "It is difficult," he says, "with the limited number of combinations and permutations of red, white, and green lights to find a light that will answer the purpose." The Government are anxious that every vessel shall carry lights which shall announce three main facts—the kind of vessel, the direction of its head, and its being under command or otherwise. A trawler is a sailing vessel, and when at work it has steerage way, but it is not under command, and consequently it ought to carry a special light which may distinguish it from sailing vessels at anchor, and from sailing vessels which, though under way, are also under command. If trawlers are given their heart's desire, and allowed to carry a single white light, what is to mark them off from vessels at anchor or from pilot vessels? Altogether Mr. CHAMBERLAIN thought that the best thing to do would be to strengthen the Departmental Committee, and set them to work again, leaving trawlers free to carry their present light until some further conclusion should be come to. After a good deal of grumbling, this proposal was accepted, and the motion was withdrawn. The only thing to be regretted in the discussion is that Mr. CHAMBERLAIN's modesty should have prevented him from giving the House an account of a little cruise in the North Sea which he took on Wednesday week in company with Mr. BIRKBECK and Sir W. FOLKES. Both his companions were evidently eager to tell what had happened, but felt their mouths sealed so long as Mr. CHAMBERLAIN's remained unopened. Can it be that the President of the BOARD OF TRADE was not quite well while he was aloft?

The trawling interest is not the only one that finds its peace disturbed. There are worse things than accidental collisions, and the drift net fishermen complain that they are exposed to direct attacks of a very injurious kind at the hands of trawlers. The drift net is so arranged as to float at a depth of only a few feet below the water, and when "shot" may extend to a distance of a mile and a half from the boat. The trawl net, with the beam to which it is attached, is allowed to sink to the bottom of the sea; consequently, if a trawler, with his beam and net down, sails across the course of a drift net fishing boat, it may inflict very great damage on the nets. There are two motives which lead a trawler to do this—desire to avoid the trouble of hauling up his trawl, and the value of the portion of the nets which he may carry away with him. In order, therefore, to get through the work more thoroughly, an ingenious instrument has been invented, called "the Devil," which hangs over the trawler's bows. It has a stem a yard long, and four blades like scythes. When these blades come across a drift net they cut it all to pieces, and the fragments which are carried away by the trawl are often sold for considerable sums. No English trawler resorts to this practice, partly, it may be hoped, from good feeling, and partly, perhaps, from the almost certain detection which would follow. But, as regards French, Dutch, and Belgian trawlers, the law is in a very unsatisfactory condition. A Convention was in force between France and England from 1839 to 1868, but it did not extend to the North Sea. In 1868 the Sea Fisheries Act was passed, to which a convention was attached which included all fisheries surrounding the British islands outside the three mile zone; but this convention has never been ratified. If this omission were set right, and similar conventions concluded between Great Britain and Belgium and Great Britain and Holland, Mr. HIGGIN, the Commissioner employed by the Home Office, thinks that these outrages would be easily stopped, though the law would need to be enforced by the presence upon the fishing-grounds of cruisers belonging to each of the four Powers concerned. It does not appear that the Governments of France, Holland, and Belgium are at all indisposed to bring their subjects to book for their misdeeds, and on the few occasions when some peculiarity in the case has brought the offender within the grasp of foreign law, substantial justice has been done. But these occasions are so few that the prospect excites absolutely no terror, and the foreign trawlers continue to be the pirates of the drift net fishery. The loss

inflicted by them is directly felt by all engaged in the trade. The master and crew of these drift net fishing vessels are not paid wages by the owners. They receive a fixed share of the profits after the expenses of the voyage have been deducted. Consequently, when the destruction of nets makes an addition varying from 10*l.* to 300*l.* to the cost which has to be defrayed before the profits are divided, it falls upon the cabin-boy proportionately with the owner. To all appearance the English Government can, if they choose, get these conventions concluded. Considering that an important industry is greatly crippled by the want of them, it is to be hoped that the twenty and odd years during which these outrages have been left to go on unchecked will now be followed by a period of greater diplomatic activity. It is a pity to allow a large number of humble men to be injured, and a certain amount of international ill-will to be created, for the want of a little importunity.

HUNGARY.

THE Emperor of AUSTRIA, as King of Hungary, has been visiting Pesth to bid farewell to the Diet, which has now come to the end of its allotted term. The House of Representatives was elected three years ago, when things were in a very different state from that in which they are now. Then everything seemed unsettled, Hungary was called on to make considerable sacrifices, the black cloud hanging over the East had hardly begun to rise, and the Hungarians thought themselves exposed to dangers greater than those which beset the other portions of the Austrian Monarchy. Gradually the prospect cleared, the Legislature settled down to steady work, and the Ministry of Herr TISZA, although constantly assailed, held its own, principally through the personal influence of the EMPEROR himself. In giving the customary summary of the labours and successes of the Diet, the EMPEROR was able to place on record a very satisfactory list of financial and legislative achievements. The recent conversion of the public debt was effected so easily and so triumphantly as to give the world an incontestable proof that the credit of Hungary has greatly risen in the markets of Europe. The speech of the EMPEROR gives the reasons for this rise of the national credit. Hungary has been attending to its own business, carrying out material improvements, remedying imperfections in its laws, and making satisfactory provisions both for the new charges which have fallen on Hungary as on the whole monarchy, and also for the repayment of the floating debt. As the EMPEROR said, a whole series of laws—judicial, administrative, and economic—have been enacted. The new Criminal Code has been brought into operation, and a bankruptcy law has been passed. The august mother of Parliaments may envy a legislative body in which a Criminal Code is more than a matter of momentary talk, and a Bankruptcy Bill is actually passed because it is grievously wanted. A uniform law regulating the services of the police throughout the whole country has brought method into the defence of persons and property; and the thorny questions which attend naturalization in a country having such complicated relations with the outside world as Hungary have been satisfactorily settled. The building of railways has been carried on with as much energy as could have been expected at a time of political and financial difficulty. Several gaps in the network of Hungarian laws have been filled up; and, as the EMPEROR is reported to have said, the great connexion eastward has been secured. This may refer either to the Roumanian or to the Servian lines, and may perhaps refer to both. Anyhow, Pesth may now be looked on as the central point of the movement which is to one day connect Western Europe with the Egean and the Black Sea. These are great things to have been achieved in the short space of three years for which the House of Representatives is elected; and they have been achieved by the hearty co-operation of the Hungarians and their KING. Even the record of their own achievements did not awaken so much pleasure in the minds of the KING's hearers as his reference to the recent marriage of the heir of the Crown, and his confident appeal to a loyalty which has been strengthened by the creation of a new tie between his dynasty and those who were in old days rebels against him and his house.

When the representative portion of the Diet was elected three years ago, the great event of the day was the occupation of Bosnia. Hungary bitterly resented the Treaty

of San Stefano, and was not entirely pleased with the Treaty of Berlin. The provisions of the treaty which broke up the great Slavonic principality designed by Russia were acceptable enough to a people whose one personal thought is a dread and horror of the Slavs, and of Russia as the patroness of Pan Slavism. But Hungarians thought it highly unsatisfactory that Austria should embrace a new Slav population in her fold. There were already far too many Slavs under the Austrian Crown to please the Hungarians, and in the carrying out of the occupation there were two things which struck the Hungarians as peculiarly disagreeable. The occupation was resisted, and it was resisted by the Mussulman population. This is the element in contiguous nationalities with which Hungarians have the warmest sympathy, as Hungarians and Mussulmans are bound together by a common hatred of Russia. It was, therefore, the special friends of Hungary who had to be put down by force in Bosnia, and by an unlucky accident it was on Hungarian regiments that the chief brunt of the conflict fell. A popular cry arose in Hungary that the Hungarian regiments had been selected for the post of danger in order to punish Hungary for its dislike of the occupation. In spite, however, of all adverse influences, the Ministry had a decisive majority. The PRIME MINISTER lost his seat at Debreczyn, but was elected elsewhere, and had a Ministerial majority of not far from two to one. But when the resistance of the Bosnians was overcome, the discontent of Hungary was so great at finding that Bosnia was not to be considered as coming in its sphere, that first the FINANCE MINISTER and then the PRIME MINISTER resigned. Here, however, the personal influence of the EMPEROR was successfully used. He would not accept the resignation of the TISZA Ministry, and arranged that it should continue in office until things had been smoothed down by judicious treatment. It met the new Parliament in October, and a proposal to impeach it was at once made, and was defeated. The contest was renewed in the debate on the Address, in which Herr TISZA explained the policy of which he was willing to accept the responsibility. Its main feature was the determination to make the minor Oriental States and the races dwelling therein understand that, if at any time the confusion in the East could not be controlled, the Power that would have the greatest influence on their fate would be Austria-Hungary. The Ministry once more obtained a majority, although a much narrower one than that on which they could ordinarily reckon. But the battle was practically won. The Treaty of Berlin was formally accepted by the Hungarian Parliament a few months afterwards, the Ministry this time being supported by a substantial majority; and immediately afterwards the silver wedding-day of the EMPEROR and EMPRESS was celebrated at Pesth with every sign of fervent loyalty. The dislike of the occupation of Bosnia and of the new departure of Austria in the East had been surmounted in deference to the wishes of the EMPEROR. On the other hand, the increasing reserve of Austria and its almost ostentatious shrinking from anything like a policy of adventure in the East had been greatly strengthened, if not caused, by the attitude of Hungary.

The political situation being thus cleared, the Hungarian Parliament gave itself up to practical legislation, in which it has done the very creditable amount of work described by the EMPEROR. But, much as the EMPEROR is liked in Hungary, and willing as Hungary may be to do much to please him, there are continually being revealed radical differences of opinion which make the relations of Pesth and Vienna anything but harmonious. Pesth is for Free-trade, Vienna for Protection. Pesth detests the Slavs, whom Vienna courts and attempts to gratify. When protectionist Austria wishes to make a commercial treaty with protectionist Germany, it is greatly hampered by the exigencies of Hungary, which has no manufactures to foster artificially, and has an abundance of raw produce which it wishes to send to the best market. On the other hand, the political alliance of Germany and Austria is approved in Hungary, as the Hungarians see in the German Empire the most trustworthy bulwark against Pan Slavism. What they dislike is that Austria should at once ally itself with Germany against Russia as the head of the Slavs, and yet endeavour to conciliate the Slavs of the Austrian Empire by concessions which alter in their favour the constitution of the Austrian half of the Empire. The TAAFFE Ministry has

set itself to make two concessions to the Czechs, which in themselves are not by any means unreasonable, but which are regarded with great jealousy, not only by the Hungarians, but by the Austrian Germans. The first concession is the creation of a separate Bohemian University at Prague, and the second is the remodelling of the electoral law of Bohemia, under which, as things now stand, the German population enjoys a much larger share in the representation than its numbers warrant. Theoretically the Hungarians have nothing to do with changes affecting the half of the Empire to which they do not belong. But practically they know that the determination of the foreign policy of the whole Empire rests with Vienna, and they fear that, if the Slavs have too much influence at headquarters, the whole Empire may be swept away by a current to which the Hungarians could offer no effectual opposition. Some Hungarians go so far as to declare that, rather than endure this, they would break away from Austria altogether, although even the most excited always declare that they will somehow keep the Emperor as their king. This is for the moment only idle talk. But it points to a real danger to Austria—a danger which nothing but time and patience and tact will enable Austria to surmount. This danger springs from the widely spread conviction among the Hungarians that Hungary and Austria are equals who have chosen to make the experiment of a special kind of union, and that either party is at liberty to withdraw from the arrangement if it does not like its practical operation. The tie which unites Hungary and Austria would be much weakened if it were supposed to be not a community of interests or sympathies so much as a community of loyalty to the same person.

DECOYING.

IN the present state of public business even the appointment of a Select Committee is a step which may well have its terrors, and it is creditable to the Government that they should themselves have proposed an inquiry into the decoying of English girls into Belgium for immoral purposes. This crime is very common, and is apparently quite untouched by any existing English law. The Belgian law forbids the registration of any woman as a public prostitute who is under twenty-one years of age. Prohibitions of this sort are commonly evaded without much difficulty, but in this particular instance there seems reason to believe that the law is broken with less ease or less impunity than might be supposed. At all events, whether because Belgian girls are not to be enlisted earlier, or from some other cause, there is a considerable demand for young girls from England. In so far as they go of their own free will and with a full knowledge of the purpose for which they are wanted, nothing can be done to check the traffic. But in the great majority of cases they have not this full knowledge, or indeed any knowledge at all. Even if the deception practised on them extended merely to the particulars of the life they will lead in Belgium, they would be fit subjects of legal protection. But their ignorance goes very much further than this. They have no idea when they leave England that they are going to be prostitutes. They go out in the expectation of being hired in some decent capacity—of becoming ladies'-maids or actresses, nursery governesses or shopwomen. It is only when they reach Brussels or Antwerp that they find out for what end they have really been got hold of. When they do come to understand this, they are usually quite helpless. They seldom speak French, so that they have great difficulty in appealing to the police, even if an opportunity offers itself. Nor are such opportunities at all abundant. A girl is kept a strict prisoner, and if she sees a policeman in the house, she probably does not know him to be one. More than this, it is permissible to suspect that the police themselves are not always anxious to know more than, in the interest of the keepers of these houses, it is expedient they should know. Worse still, the wish for deliverance very often disappears. When a girl has been either seduced or drugged—and, under the circumstances, the girl who yields to persuasions is hardly a more willing victim than the girl who yields to violence—she ordinarily feels that, even if she could escape, she would not know what to do with herself. She cannot hope to live respectably in Belgium, and the fact that she was anxious to leave England in the first instance suggests

that she was destitute of friends who might have enabled her to live respectably in England. There will be still less chance of such a living if she now goes back, and runs the risk of her life abroad being thrown in her teeth. The more respectably she has been brought up, and the more ties she has to bind her to England, the keener is likely to be her shame, and the stronger her determination not to carry her shame home. It is impossible to conceive a more miserable fate than that which befalls a girl thus circumstanced. She has presumably a more than common share of natural energy, or she would not have determined to seek her fortune in a foreign country. In the first instance her hopes seem to be justified. She hears that she has a good prospect of finding immediate employment, or very probably has immediate employment offered to her. She leaves England with what seems an excellent chance of making an honest livelihood, and a day or two later she finds herself in a Belgian brothel. Once there, everything makes against her. Her power of resistance is weakened by narcotics; and she sees no one except the servants, who are in league with the keepers of the house, or the visitors, who do not trouble themselves to distinguish between real and simulated modesty, and are not disposed, even if they suspect the truth, to provoke inquiries which may not be convenient for themselves. Unless she has an heroic determination of character, she sees nothing before her but a gradual descent to the level of the miserable creatures who are in the same position as herself. And all this has come upon her in an interval that can be expressed in hours, and without any real fault on her side. If any law can be devised that shall put an end to a trade so detestable in itself and so disastrous in its results, the plainest possible case has been made out for at once calling such a law into being.

An inquiry by a Select Committee, though necessarily a somewhat slow process, is on the whole the best that can be adopted for the purpose. Crimes which are prepared in one country and committed in another are necessarily difficult to suppress. A Select Committee has some advantages in dealing with a subject of this kind which are not possessed by a Government department. It exists for this special purpose, so that it is not liable to have its attention diverted by pressing administrative business. Its action is public, so that if any evidence is to be had in quarters where the Government would not think of looking for it, there is at least a chance that it will be voluntarily offered. It is freer to consider all the methods of suppressing the crime that may be suggested, because the immediate object for which it sits is inquiry and not action. The Committee will have, by way of a point of departure, a Report from an English barrister, who was sent out by the Foreign Office last autumn to watch certain trials which were going on at Brussels. This Report, as we learn from Lord DALHOUSIE's speech in moving the appointment of the Committee, shows that for many years English girls have been decoyed to Belgium by professional procurers, who are paid a commission of 12l. on every girl they land. Since 1865 there have been at least twenty of these procurers at work in London, and Mr. SNAGGE was able to collect the names and test the stories of thirty-two English girls who had been decoyed to Belgium during the last ten years, all of whom were under twenty-one at the time. Considering the difficulties which beset such an inquiry, and the unwillingness of many of those to whom it relates to have any attention drawn to their history, Mr. SNAGGE is no doubt right in believing that the number of cases he has established by inquiry form but a small proportion of the total number. One existing English statute makes the procuring of a girl for prostitution, by false pretences, a misdemeanour; but it does not apply to cases where the offence, though begun here, is completed in a foreign country. There are two other statutes referring to abduction; but one deals only with the abduction of women possessed of property, and the other with the abduction of girls under sixteen. The consequence is that the special field which this trade covers—the procuring by false pretences of girls not under sixteen to be prostitutes abroad—remains altogether untouched.

Mr. SNAGGE's Report also contains suggestions as to the means of suppressing the trade, but in the methods proposed he is not very original. He suggests that the law should be made more stringent, and that the punishment should be more severe. He also suggests that the law should be extended to cover cases where the offence is completed in a foreign country. He also suggests that the law should be extended to cover cases where the offence is committed in a foreign country.

make it a criminal offence to entice any one to become a prostitute, whether within the Queen's dominions or not, is obviously the first thing to be done, inasmuch as the crime must be recognized as such before it can be either punished or prevented. This alone, however, is not likely to be of much value. The difficulty of proving the commission of the offence would still remain, inasmuch as, though the enticement would be practised in England, it would not—being under false pretences—be known for what it was until the arrival of the victim in Belgium. Nor does the recommendation that it should be made more difficult to obtain certificates of birth from Somerset House seem to be of much value. As those certificates must show that a girl is under twenty-one, while they are used in Belgium to prove that she is over twenty-one, forgery of some kind must already be practised in connexion with them, and it might not be much more difficult to forge an entire certificate than to alter the date in a genuine one. The real remedy must be looked for in a more harmonious co-operation between the English and Belgian police, and, if necessary, in some modification of the Belgian law. It ought not to be possible under that law to take a girl into one of these houses without her being first seen by the police; but, supposing this impossibility to be more thoroughly assured, there can be no difficulty in providing that any girl, not a Belgian subject, shall not be admitted until she has been questioned by her own Consul. If once this could be secured, the traffic must cease. It would be of no use to decoy English girls to Belgium under false pretences, when the truth would be made known to them before the object for which they had been decoyed had been answered.

CAMPDEN HILL.

WHEN the Campden charities, of which we have heard so much lately, came into existence, Kensington was a country village. Sir Walter Cope lived at one of the two manor-houses the parish contained; and besides his residence, afterwards known as Holland House, there were two or three villas, more or less important. From the churchyard in the village high street, a noble avenue of elms led straight up the hill to Campden House, the entrance gates being ornamented with two well-carved hounds, the supporters of the newly-enobled Alderman Hicks. From his estate at Campden Chipping, in Gloucestershire, he derived the designation of his viscounty, and bestowed it on the suburban hill on which he built his town house. The land, won at the gaming-table from Sir Walter Cope, was well laid out, and a house not unworthy of its neighbour was built. Although Campden House can never be compared with Holland House, either for size or for beauty of design, it had architectural features suitable to the rank and wealth of its owner; while its situation was so commanding that it formed a conspicuous object from the opposite hills of the Surrey side. The intervening valley, now grey and dim with the smoke of a hundred thousand houses, must then have looked green and smiling on the margin of the silvery Thames, and the view from Campden Hill may have rivalled that still to be seen from Richmond. Baptist Hicks, the first occupant of Campden House, died in 1629, leaving his honours to his son-in-law, Edward Noel. His will contains so many charitable bequests that Stowe devotes a special chapter to it and to "an epitaph made in his Memoriall," of which a short specimen must suffice:—

Faith true,
Hope firm,
Charity free,
Baptist, Lord Campden,
Was these three.

His bequest to the parish of Kensington consisted of a sum of 200l., "to be yearly employed for the good and benefit of the poor." This legacy was invested in the purchase of land at Shepherd's Bush, and now brings in 480l. a year, which has accumulated until the trustees have more than 10,000l. in Consols. Lord Campden's daughter, the widow of Edward Noel, the second Viscount, left a similar legacy, and the parish bought with it Butt's Field, which, being situate opposite Kensington Gardens, and near Kensington Gore, now brings in 366l. a year, while some 40,000l. have accumulated. The Noels, continued to reside at Campden House for about a century. In the meantime Kensington had become fashionable, and before long the number of villas had been doubled. Kensington was particularly affected by Cromwell's friends. General Lambert, called Lord Lambert in the register; Sir William Strickland, one of Cromwell's peers; Sir Edward Dering; Sir Thomas Foot, another of the Protector's lords; and several others are mentioned in the parochial records, which also contain the register of the marriage of "Mr. Henry Cromwell" and Elizabeth Russell in 1653. He probably resided in the house near the South Kensington Museum which has given the name to Cromwell Road, and he may have been the donor of a benefaction to the parish. In 1651—two years, that is, before his marriage—twelve

parishioners became trustees of the charity; but no mention is made in the deed of the person by whom the money, amounting to 45*l.*, was paid. The Campden trustees took charge of it, and two acres of land in the Gravel Pits were bought. The land now forms a considerable portion of High Street, Notting Hill, and brings in more than 1,000*l.* a year. These Gravel Pits and their fine air are often mentioned in contemporary memoirs. Their nearness to London made them a popular resort, especially for people in delicate health. And when Lord Nottingham sold his house to William III. the fortunes of the district were established; for though Kensington Palace is in the parish of St. Margaret's, Westminster, most of the courtiers resided in Kensington; and the square constructed a few years earlier, in the time of Charles II., was crowded with notable folk. A few houses still remain whose deep cornices and picturesque red brick suggests the handiwork of Wren; and the corner house, lately a Roman Catholic school, in which the Duchess of Mazarine alternately charmed and disgusted Charles II., is still pointed out, and, though much altered, it is substantially the same. A greater envoy from France than even the Duchess resided in it in years not so remote from our own. It was remarked, to the credit of Prince Talleyrand, during the time he lived in Kensington, that he paid his bills very punctually.

Campden Hill rises to a height of fully one hundred feet above the level of Kensington Square, and the mere name of the Gravel Pits suggests its former character. Before it was enclosed for villas it was probably an open heath—the gardens and orchards of the valleys shunning the exposure of the situation. Gradually it was encroached upon. First, the Craven family, deserting Drury Lane, built their new residence at what has ever since been called Craven Hill. Colby House appeared at the opposite side; Sheffield House was near the summit; and the High Street was full of fine mansions. Here lived, at the end of the seventeenth century, the Onslow, of whom the future Spenser was baptized at Kensington Church, in 1691; the Boyles, of whom the astronomer, Lord Orrery, was baptized in 1674; and the Pratts, whose most illustrious representative, the future Lord Chancellor Camden, was born here; it may be, contrary to the usual tradition, that he took his title from some association of a local kind, for the name of the Hill is often so spelled, and Mr. Hare, but probably by a characteristic inaccuracy, spells the name of the house without a *p*. Lastly, that nothing should be wanting to the dignity of the Court Suburb, as Leigh Hunt named it, the Princess Anne sent her little son to the Gravel Pits, for the benefit of the fresh air. At first he inhabited Lord Craven's house, which was liberally lent to the Princess; but in 1690 Campden House was taken. The amusing memoir of Jenkin Lewis tells us that "Mr. Bertie, guardian to Mr. Nowell, the heir thereof," took advantage of the Princess's desire to have the house, and "raised the rent so much, that it was imagined that any other person might have purchased it for less." Yet the house was too small for its august occupants, and a building now known as Little Campden House was added to it on the western side. The poor little Prince is carefully described by his servant Lewis; even his height and weight are recorded, and the remarkable size of his head. We read of his being blistered, of his being very mildly birched, of his taking the Jesuit's medicine for ague, of his new clothes and of his stiff waistcoat, of his tumbles, and of his refusal to go to prayers. The record is full of local allusions; but perhaps the most interesting part is that which relates to William III. He appears in a new and amiable light, caressing the little nephew. He named him the Duke of Gloucester, a title he did not live to receive formally, and when he was six years old bestowed the Garter upon him. The child was devoted to military pursuits. Every one has heard of his boy regiment. His attendant, Lewis, and Mr. Prat, his tutor, vied with each other in making fortifications of pasteboard in the grounds of Campden House; and when the King came to visit him he fired a salute from real guns, with real powder. His boy regiment was partly recruited from London. Kensington was not yet populous enough, perhaps, to furnish more than a couple of score or so; and we read complaints of their insolence when dismissed from parade. They always assembled on holidays at Campden House, and were put through their exercises by the little Duke, who enforced strict discipline and administered the military punishments in vogue at that date. But when they were coming from London or going home they were often, we are told, very rude, "and would challenge men and fall on many people." On more than one occasion they were reviewed by King William himself, and their commander said to his uncle, "My dear King, you shall have both my companies with you to Flanders." William doted on the child, and evidently thought he would turn out a soldier like himself. When he appointed Marlborough his governor, he said, "Teach him what you are, and my nephew cannot want accomplishments." Bishop Burnet was his preceptor, and has left a curious account of his precocious faculties. At ten years old he had made much progress in classics and history. The King used to send some of the Ministers at intervals to examine him and report on his proficiency. Bishop Burnet acquainted him "with all the great revolutions that had been in the world." When we read of the medicine he took, of the blisters he wore, of his big head, his weak little legs, and his wretched appetite, we are not surprised to find the Bishop's task came very soon to an end. "The last thing I explained to him," he says, "was the Gothic constitution and the beneficiary and feudal laws." On his birthday at Windsor, in 1700, he danced till

he was overheated. Then he took a chill, "which brought on a malignant fever," so they thought in those times, and five days later the last of Queen Anne's seventeen children had joined the rest.

Campden House underwent many vicissitudes after this date. Five years after the Duke's death another clever boy lived in it. This was young Boyle, afterwards Lord Burlington, the architect. He may have imbibed some of his taste from the contemplation of the many beauties of the old house, its mullioned windows full of stained glass, and its magnificent carved panelling. It was shortly afterwards sold to Lord Lechmere, who is now chiefly remarkable as having been satirized by Swift, who speaks of "Campden House so high," and "kingly Kensington." At the beginning of the present century it belonged to a Mr. Stephen Pitt, who, residing himself in Little Campden House, let the older building to some ladies who kept a school. Here Maria Pagnani, afterwards Marchioness of Hertford, was sent for her education by George Selwyn. Mr. Pitt built Pitt Street, close by, and probably also the mock Gothic tower which adorns a corner of the wall of Campden House, and is so conspicuous from Sheffield Gardens and Sheffield Terrace, two rows of houses which recall the existence of Sheffield House, alluded to above. Campden House was destroyed by fire in 1862, and rebuilt very nearly on the original plan immediately afterwards. The architect, however, neglected to avail himself of the many old prints of the exterior which are to be seen in the books of Lysons and others, and, instead of the curious stone parapet, there is a series of gables, very picturesque, it is true, but otherwise unsatisfactory. The gardens have been somewhat curtailed of their ancient proportions, and part of the churchyard of St. Mary's is on the site of the old gate with its dogs. When the Underground Railway was made, a tunnel was burrowed through the garden, which is not apparently injured; and the old place is now well kept up, and materially helps Campden Hill to retain its ancient look of umbrageous verdure. Mr. Pitt, mentioned above, left his name in Pitt's Buildings and Pitt Street, and some inaccurate historians assert that Sir Isaac Newton died in Pitt's Buildings. He came out to Kensington for change of air on more than one occasion, and finally died in a house still existing. It is now a school, and is known by the name of a family one of whom, John Bullingham, was Bishop of Gloucester, and was buried in Kensington Church in the reign of Queen Elizabeth. Holly Lodge, where Macaulay died in 1859, is not far from Campden House, in a little district of handsome villas locally known as "The Dukeries."

DOGS AND GRAVES.

A CELEBRATED Eastern or pseudo-Eastern curse has always been a little unintelligible, or, if not unintelligible, conventional, to the English mind. Our own associations between dogs and graves are rather derived from Scott, Wordsworth, and the famous incident on Helvellyn, than from any acquaintance with the doings of the actual animal of the Parish variety. Any one who wishes to realize the full discomfort of having the grave of his grandmother or any other respected person treated as the proverb suggests may be recommended to read the current number of the *Contemporary Review*. The editor of that periodical has a fancy for what are called nowadays *symposia*—a word which, we suspect, unclassical readers are apt to suppose to be Greek for a general scrimage. He has got the pleasant author of *Thalatta* to write a memorial article on Lord Beaconsfield from the friendly side, and Mr. Alfred Austin to add some verses in a similar strain. Sandwiched between these comes an article from the pen of the Reverend Malcolm MacColl. Now, far be it from us to say that Mr. Malcolm MacColl is an inappropriate person to write biography. On the contrary, he has some of the most valuable characteristics of the biographer—an amiable tendency to haunt the neighbourhood and personal society of great men; an innocent delight in recounting their conversation with him in their *malitia tempora*; a cheerful consciousness of reflected honour in the telling of his story. If Mr. Gladstone were to die—which heaven forefend—and if Mr. MacColl were to outlive him, some thought such as that which Heine formulated in one of his wickedest and most apparently harmless phrases ("Goethe sey todt und Eckermann sey zu leben") might pass through our minds, but we should look forward to a very satisfactory life of "my great friend" damaged only by an incurable belief on Mr. MacColl's part that argument fresh from his own mint was necessary to support and buttress his great friend's admirable conduct and conclusions.

In relation to Lord Beaconsfield, however, the absolute fitness of Mr. MacColl for his post on the present occasion is more doubtful. He is, we are sure, superior to the degrading law which ordains that a great man shall not be a great man to certain varieties of hangers-on. But then he was not Lord Beaconsfield's hanger-on. Still, it would be unjust to deny him the credit of having produced something very like a masterpiece. We shall pay no attention to his purely political criticisms, because, in the first place, Mr. MacColl's political criticisms, except when they are inspired, are purely his own affairs; and because, in the second, this is not the place to do anything with them. What is really interesting is to scratch the conduct of the critic with the personal history, motives, &c., of the dead man. Mr. MacColl's first object is to prove that Isaac Disraeli was a free-thinker and

a man of violent polemic language—*ergo*, it was probable that his son would be a free-thinker and a man of violent polemical language. Q. E. D. Then the son went to school. Nor was his experience of school life calculated to wean him from the religious scepticism which he had imbibed (*ex hypothesi*) from his father. This experience Mr. MacColl infers to have been one of persecution and ill-treatment. It is nothing that numerous *souvenirs* of Lord Beaconsfield's school life have been published, and that no such experiences are hinted at. "That he was thus treated is," Mr. MacColl thinks, "apparent" from *Vivian Grey* and *Contarini Fleming*. What Lord Beaconsfield would have liked to do would have been to carry out Vivian Grey's plan of joint revenge on the usher and the boys. Contarini Fleming's tight, his frantic revengefulness, "the characteristic touch of the foreign boy's scorn for the rules of fair fighting," are "coarse and brutal, but probably no more than an exaggerated expression of what the writer felt." Besides, is the vengeance so very different in kind from Lord Beaconsfield's treatment of Sir Robert Peel? So Mr. MacColl; and, indeed, there is no doubt at all that Shakespeare would have liked to smother Anne Hathaway like *Deemona*, and that the scene between Cornwall and Gloster is only an exaggerated expression of what the writer felt towards his rival in the sonnet matter.

Hitherto Mr. MacColl has been occupied in exegetics, constructing Lord Beaconsfield's early character (a dreadfully bad one) from the probabilities of his training and the apparent evidence of his novels. After school days the future scourge of the mild and cleanly Bulgarian read Voltaire. It is doubtful whether this reading of Voltaire is more terrible to Mr. MacColl as a true believer or as an anti-Semite. The patriarch, however, planted, it seems, in the breast of this fiendish youth—an appropriate scil—the resolve "to turn the tables on those who had deepised him." He resolved to "humble himself and practise all the arts of deceit in order to obtain the position he coveted." The humility, by the way, of Disraeli the younger is a precious *trouvaille* of Mr. Malcolm MacColl's. The critic rather wonders that the career which followed was "so free from moral stigma," and, indeed, on his own hypothesis, it is a little surprising, especially as he proceeds to show how Mr. Disraeli's moral corruption was completed by his association with Lady Blessington and Count d'Orsay, whom Mr. MacColl is good enough to describe as if nobody had ever heard of them. The evil task begun by Isaac Disraeli, continued by the school persecutors, by Voltaire, and by poor Lady Blessington, was finished by Bolingbroke. Here Mr. MacColl is more liberal than ever. He actually gives us a character of Bolingbroke. The application of that character of course is nothing new, though Mr. MacColl hardly acknowledges the copyright owned by a certain essayist of three or four years ago, but for whom, for aught we know, Mr. MacColl would never have heard of Bolingbroke. As, however, the main actual contact between the two is to be found in a phrase of Lord Beaconsfield's own—"The Tory party is a national party, or it is nothing" (this peculiar nationality in Bolingbroke was recognized, be it remembered, by so impartial a judge as Thackeray)—it is not to be wondered at that Mr. MacColl should miss it. His own endeavours are chiefly devoted to the task of proving that Bolingbroke was a free-thinker, and that consequently Lord Beaconsfield was one. Q. E. D. again. However, when Mr. MacColl goes off into politics or theology we shall not follow him. He has a right to his opinions there, and in supporting them gives no proof of anything worse than dulness, which he cannot help. What is rather pleasing, however, is the charge of inconsistency which he makes against his enemy. Does not even Mr. MacColl see that this particular stone has a terrible tendency to come back against the windows of his own idol? This, however, is perhaps matter of argument; not so what follows. For exquisite combination of unhappy qualities the following passage will perhaps bear the bell over anything even in this essay:—

His exemplary devotion to his wife has been referred to already. And that devotion derives additional merit from the fact that it was lavished on a wife, much older than himself, not strikingly attractive, and not wedded chiefly for love. Few men occupying such a position as Lord Beaconsfield's would have bestowed upon such a wife during their long years of married life all the attention and gallantry of a youthful lover. It was probably not her fortune alone that induced Lord Beaconsfield to marry a widow so much his senior.

And then follows a quotation from *Vivian Grey*, to the effect that a "young and handsome" wife is an obstacle to a statesman—that is to say, the reader is invited to see the Eastern proverb applied to two graves, not one. "You," the critic says to the one victim, "married partly for money and partly for other unworthy reasons." "You," he says to the other, "were old, you were ugly, you were married mainly for your money, and certainly not for any personal attraction." It is true that he makes such amends as self-portraiture may afford by indicating—quite unconsciously, no doubt—his own standard of the affection and gallantry which need be bestowed on a lady who is unfortunately not young or handsome by her husband. But this, though it completes the general harmony of the picture, cannot be said to be an atonement. In foolish old days women and the dead were supposed to be privileged from attack; but Mr. MacColl, as becomes his circumstances and allegiance, has mastered that superstition. The other passage which we have referred to is a pleasant self-revelation of a similar kind, fortunately marred by no such disgusting accompaniments. Mr. Gladstone, it seems, once honoured Mr. MacColl himself by an anticipation of his statement in the House, saying "I don't believe that he hates me at all." The comparatively imperfect satisfaction which this statement pro-

duces has been before now referred to. That, however, is not the point. "Then," says Mr. MacColl, "*somewhat to my surprise, I own*, Mr. Gladstone expatiated with some degree of enthusiasm on Lord Beaconsfield's debating powers, his splendid Parliamentary pluck, and other qualities." "*Somewhat to my surprise*" is certainly *impayable*. Could not Mr. Austin Dobson, our modern Gay, give us a fable of two lions and a jackal, and of the surprise of the jackal at discovering that his employer respects his foe? Mr. MacColl's surprise is, indeed, not complimentary to Mr. Gladstone, but it is still less complimentary to Mr. MacColl.

The memory of Lord Beaconsfield owes not a little to the editor of the *Contemporary Review*. He might have committed the task of devil's advocate to some really dangerous master of the craft. Either by dint of adroit insinuation, or of generous praise and recognition, mingled with uncompromising denunciation of conduct, but unspoiled by imputation of motives, a good enough or bad enough case might have been made out against that singular career. But the stuff which we have quoted, at once uncritical and ill-mannered, insolent and dull, will hardly give much satisfaction even to the members of the West Ham Liberal Association and the President of the Rutland Conference of Particular Baptists. We once heard Mr. MacColl unkindly defined as "a bore who writes to the papers on the Eastern Question"; and an amiable defender of his added apologetically, "Yes, but you know Mr. Gladstone puts things into the bore's head." We are quite certain that Mr. Gladstone did not put this thing into Mr. MacColl's head, though very likely Mr. MacColl's zeal for the house induced him to efface the memory of Mr. Herbert Gladstone's unlucky speech by showing that some one can speak of Lord Beaconsfield more foolishly and more indecently than the member for Leeds. If this be the case, it is an instance of touching devotion and complaisance which no eighteenth-century chaplain ever exceeded. Mr. Herbert Gladstone did not, as far as we can remember, criticize the personal charms of the late Viscountess Beaconsfield, or express surprise at his father's admiring Lord Beaconsfield's pluck. It is probable that Mr. MacColl can never understand—indeed, on a good old theory it may be argued that, if he could, he would never have written this letter—the disgust which his article will excite in persons who are by no means indiscriminate admirers of Lord Beaconsfield's political acts, and in many who were directly opposed to him. The animal to whose Eastern achievements we have (of course in the purest metaphor) compared his proceedings is not famous for a nice appreciation of the deencies. But it is a little instructive to compare Mr. MacColl's announcement that "self-aggrandizement was the one aim of Lord Beaconsfield's life" with the deliberate statement of Lord Harrington that that aim was the good of the country—ill-understood, perhaps, but still the good of the country. Had Mr. MacColl any new facts to offer the case might have been different. But he has had in this curious analysis no light to throw on the idiosyncrasy of Lord Beaconsfield, though he has thrown much on a matter of less importance—the idiosyncrasy of the Reverend Malcolm MacColl.

LONDON IN EPSOM WEEK.

THE weather is always a subject of interest in England, and there are sundry classes of our countrymen to whom, like our heavily-handicapped farmers, it is matter of constant and vital concern. All through the summer and the early autumn there are hosts of holiday-makers whose plans of enjoyment may be marred by the vagaries of a singularly capricious climate. But there is one week in the year over which Londoners, with the crowds of strangers in their streets, are sure to be specially excited, and that is the Derby week. The weather makes all the difference between hope, mirth, and high spirits on the one side, and disappointment, depression, and despondency on the other. Snowstorms in June, although not altogether unknown, are nevertheless so rare as to be memorable phenomena; but rain and misty drizzle are unfortunately common enough. It is true that, in the opinion of the more fastidious, things may be overdone in the opposite direction. If a bushel of dust in March be worth a king's ransom—according to the proverb—dust may have gone to a discount in April and May, while in June it is probably dog-cheap and proportionately disagreeable. The suburban roads, so far as you can see them, may be sweltering in the sunshine which has been beating with untamed ardour on the Epsom Downs, baking the parched course, and upsetting the calculations of the knowing ones. So far as that goes, however, to all except some speculative knout who set business and its profits far before pleasure, the defeat of the favourite and the "cracks" is matter rather for congratulation than otherwise. It comes in the shape of a welcome sensation. As for the pleasure-seekers who crowd to Epsom in their thousands in their relief at the escape from pleasure-destroying rain, it is impossible to have a day too fine or too warm for them. From the good old times, when all the world went down by road, a successful Derby day has always been associated with dust and dust-veils and gossamer overcoats; with buckets of water for steaming steeds and brimming tankards for the thirsty "humans." Besides, it is not only for the grand day itself that the weather is a question of extreme importance. For the countless sportsmen who have come up from the country, who have crossed from the Continent, or who have even taken berths in ocean steamers from the colonies, we should say that the aspect of the skies and the metropolis for a few days in

advance is felt generally to be of even greater consequence. Everybody who has come to years of discretion has been taught almost unconsciously by personal experiences, while on the eve of some event to which he has long looked forward, to make the most in the meantime of the pleasures of hope.

And what a motley assemblage we have in London in the Derby week of men who have planned and schemed and intrigued to be present. To an immense number of people, both strangers and residents, the Derby week is the actual height of the season. Masters of hotels and keepers of lodgings are reaping the richest of this annual harvest; and even second-rate houses for once in the year may indulge in the unfamiliar luxury of summarily rejecting urgent applicants. The bachelor quarters of St. James's are filled to overflowing from ground floor to garret; in the coffee-rooms of certain semi-sporting and military hotels the greatly worried waiters are being worn to shadows. The military Clubs are in their fullest feather, and long-parted friends renew the intimacies which were things so remote as to be well-nigh forgotten. Officers from the Indies, more or less distinguished, but either bronzed by the sun or tinted in salmon colour by liver complaints, had timed their arrival in town on "short leave" so as to pass themselves previously through the hands of outfitters and tailors. Already they have got glibly on their tongue-tips the babble of the betting-ring and the gossip of Tattersall's. Moreover, to do them simple justice, many of them know more than a thing or two in horseflesh; they have probably owned half-Arab racers of their own, and ridden them too; or possibly they have graduated creditably as "pig-stickers" in many a neck-and-neck gallop in the rice-fields and among the nullahs. They take kindly and very readily to a sport to which they have always been devoted in the measure of their opportunities. And in that respect and others they are a marked contrast to the awkward squads of our country cousins, who make themselves at least as conspicuous by their boaring as by their dress. We do not speak of the horsey farmers who show to the front in cutaways and knowing billycocks during the Islington Cattle Show week and the Horse Show. These men have bred "bits of blood" themselves, and can sit square at their fences in crossing country. Nor do we speak of the stalwart young squires who have been glorified by Kingsley and other novelists, and who nowadays have their clubs as a matter of course, and are scarcely to be distinguished from the normal man about town except by superior stamina and more ruddy complexions. We refer rather to the thriving solicitors and the junior partners of flourishing mercantile concerns, who ingeniously contrive in the beginning of June that professional engagements shall bring them to London. As they take their daily walks indefatigably abroad of a morning, or lounge up Piccadilly towards the Park late in the afternoon, it is in vain that they strive to assume airs of fashionable nonchalance and languor. Their eyes, and very naturally, will open wide and turn towards the equipages that roll rapidly by them. They hanker wistfully towards certain tempting shop windows, though it is "bad form" to stand honestly and stare. They are too evidently dazzled by the galaxy of beauty in the Row, which has ceased to charm more *blasé* loiterers. Though the stern moralist might deprecate their simple show of vanity, it is impossible for the easy-going philanthropist not to sympathize in their innocent self-complacency with their irreproachable "get-up." The country artist is conspicuous in the cut of the clothes. The boots show greater breadth of treatment than delicacy of touch; it is clear that the shiny hat never came from the *ateliers* of Sackville Street or Bond Street; and the radiance of the necktie would excite the cupidity of the most venerable and peace-loving of African potentates, tempting him to set light by repeating rifles and the rites of hospitality, and make a savage onslaught on unsuspecting guests. But the wearer, although very much alone in the crowd, is cheered by the impression of the universal admiration he excites; nor for the life of you can you help envying the freshness of temperament which must make the wilderness of London a blooming paradise to him. Yet all that happiness, whether innocent or otherwise, rests almost entirely on the treacherous foundation of the weather. We need scarcely do more than advert to a possible reverse of the picture when the emancipated Indian, broken loose from confinement at large in cantonments, exchanges the glowing skies of Hindustan for a London downpour or drizzle, and is driven to fall back on the familiar cards, or the more familiar rattle of the billiard-balls; when the country visitor, whose temporary home may be a dismal back bedroom in Covent Garden, is reduced to refreshing his eye with the spectacle of decaying cabbage-leaves as he gazes disconsolately out of the coffee-room window; when, if he hardens his heart and goes abroad in the mud, he is doomed to hide his lights under a bushel, and cover his brilliant garments with a great-coat that has seen service; when, after sitting down to a dull dinner, he goes to digest it in the stalls of a close theatre, thinking all the time of the disillusioning in store for him when he has his holiday on Epsom Downs in a downpour.

On the other hand, and merely as a dispassionate onlooker, we revel in a fine week like the present. We may have no idea of going to Epsom, whether by road or rail. We may content ourselves by reviving the memories of former years, of which the pleasures are remembered while the troubles are gone to oblivion. We may be pleased to have London left comparatively to ourselves on the Wednesday and the Friday. But it is delightful beforehand to remark all around us practical illustrations of the general buoyancy of anticipation. The steps of the Junior Clubs are

crowded with beaming young faces, which show all the brighter for the flitting shadows of blackness reflected from the features of one or two saturnine bookmakers. Towards luncheon time there is an agreeable clatter of knives and forks from behind the half-drawn sunblinds in the great dining-rooms. Looking in upon the lucky little groups that have secured tables in the windows, we are charmed by the superb indifference to the digestion shown by smoking steaks and lobster salads and mayonnaises while the thermometer stands at something considerable in the shade. That jovial midday meal, when the cheerful *couples* call for more cup or claret or bitter beer is a suggestive revelation. They eat or drink without prejudice to the dinner which is inevitably to succeed in a few short hours. Had Thackeray's "Cave of Harmony" been still in existence, we well know where they would have finished the evening, and, even as things are in these degenerate days, we should be sorry to lay any length of odds against their following up the dinner with a supper. We are sure that not a few of our sprightly young acquaintances could indulge in a light midnight refection of pork chops and Welsh rabbit, and rise in the early morning unruffled, to recruit for the promiscuous hospitality of the Downs with a substantial breakfast. With such constitutions and physical capabilities, if they are wise they will undoubtedly go down by road. We imagine them associating in companies for joint-stock drag, or arranging expeditions to suburban livery stables in quest of those refurbished open carriages which are still quoted at fancy prices, in spite of the competition of the irrepressible railway companies. Hansoms with a modest hamper on the roof are fast and misanthropical rather than jovial. They imply complicated betting books or daring speculations, with the distractions that must pre-occupy the mind till the event of the day has been settled; and then the champagne will flow only too freely, either to drown the sorrows of the moment or to celebrate an intoxicating success. But going down by road in pleasant company and good spirits is greatly to be recommended to the young "sportsman." Probably he will have no reason to regret it at the time, while it will be a picturesque recollection in after life. Who can tell what changes may be imminent? We may live to see racing and other idle recreations preemptorily put down by a people's Parliament, while a Maine liquor law that proscribes the most temperate refreshment has been acclimatized by an autocratic league of abstainers. We wish excessive drinking could be abolished, whether by Act of Parliament or moral suasion; we should be glad to see rough horseplay discountenanced; and, above all, we wish every sort of success to the Society for the Suppression of Cruelty to Animals. But this world of mingled good and evil being as it is, we owe to a fondness for a genuine English holiday like the Derby day. For one man who is locked up for drunkenness or disorderly conduct, or who deserves to be locked up, how many worthy and hard-working folks enjoy a day of innocent happiness! From the keepers of respectable refreshment booths and temporary stalls down to nigger minstrels and speculators in "Aunt Sally," to fortune-tellers, clothes-brushers, and vendors of correct cards, how many unfortunates have an exceptional chance of picking up some of the crumbs from the tables of their "superiors." And it would be difficult to maintain that there is not much to be said for a festival that brings happiness or benefits to so many.

THE FIRST FRENCH JOURNALIST.

ABLE editors are not always remarkable for the width of their erudition, and probably there are many of them who would be puzzled if they were asked to write a history of Théophraste Renaudot. Yet Renaudot may be said, without straining language much, to have been the first European journalist. The Romans, it is true, had their *acta diurna*, which may have answered to a journal which used to be called *The Day's Doings*. The Venetians, too, had their news-letters—*fogli d'avvisi*. And, in the seventeenth century, the great lords and ladies of the Court kept news-collectors in their service, as they had been accustomed to keep jesters. The *nouvelliste* was a sort of reporter who hung about the town and Court listening and spying for information, as has ever been the custom of his honourable profession. When he had made up an adequate budget of gossip, he copied it out neatly, and presented the manuscript to the lady who employed him. She, in turn, handed it about among her friends, and there were manuscript sheets of news which were lent to the curious on payment of a certain subscription. The best known of the *nouvellistes* was Loret, author of the papers known as "*La Muse Historique, ou Recueil des Lettres en vers, contenant les Nouvelles du Temps, écrites à son Altesse Mademoiselle de Longueville*" (1650-1665). Loret's *nouvelles*, however, were printed, and were a kind of "Society journal," as opposed to the serious and formal *Gazette*, founded by Renaudot. As Loret is not much read, except by people in search of the facts of social history in France, we quote from the new edition by M. Livet the lines in which he announces the death of Marion de Lorme. The date of the letter is July 2, 1650:—

La pauvre Marion de Lorme,
De si rare et plaisante forme,
A laissé ravir au tombeau
Son corps si charmant et si beau.
Quand la mort avec sa fureur
Astroline une belle fille,
J'en ay toujours de la douleur,
Et c'est cela pour grand mal-heur.

Loret must not delay us any longer from making the acquaintance of this illustrious Renaudot. This ingenious and inventive man, a native of London, published his first *Gazette* about the end of May, 1631, two hundred and fifty years ago. The *Figaro*, which prints a biography and a portrait of Renaudot, thinks that the two hundred and fiftieth anniversary of this important date might have been a good occasion for founding a press dinner. "Pourquoi la presse française n'aurait-elle pas ses agapes annuelles, comme la presse anglaise?" our contemporary asks. But no nation can have every enjoyment. The French press has its duels; we, it seems, have our *agapes*; and these national opportunities for exhibiting the affection which journalists notoriously entertain for each other should be sufficient.

To return to Renaudot. He was born about 1586, and took to medicine as a profession. Being, as we have said, inventive and adventurous, he studied the nascent science of chemistry, and employed medicines—"remèdes chimiques." He was, therefore, detested and calumniated as a quack by all orthodox physicians like Guy Patin, and they threw so much mud at him that some of it has stuck. Renaudot had the luck or skill to become the friend of Le Père Joseph, the intimate of Richelieu, and generally known as *son éminence grise*. Through the Père Joseph, or through Richelieu, he got the rank of Médecin du Roi. Yet his position as a doctor was precarious, owing to the fanatical hatred of the Paris faculty. He therefore founded various lucrative enterprises, such as the *Mont de Piété*, a journal of advertisements, and a *Bureau* where people could go in search of information on any subject. Here are some of the advertisements in the *Journal d'annonces*:—"On donnera l'invention de nourrir quantités de volailles à peu de frais." "On demande compagnie pour aller en Italie dans quinze jours." But these enterprises were all overshadowed by the *Gazette*. The paper appeared once a week, and consisted of four pages in small quarto, or later in octavo or duodecimo. The strong point of the *Gazette* was its foreign correspondence. Thus in the number published on May 30, 1631, Renaudot's "speciale" actually sent news of April 2 from Constantinople, of April 26th from Rome; while the news from Antwerp was not more than a week old, being dated May 24th. Curiously enough, the early numbers contain no domestic intelligence. In a kind of "budget," which he published once a month, Renaudot gave a summary of the month's news, and replied to his critics and opponents. Probably in these "leaders" (they were all the leading articles Renaudot knew) he took occasion to defend his antimony and other chemical medicines. Thus, in Dr. Nivelet's little book, *Molière et Gui Patin*, we find Patin calling Renaudot a "weekly blackguard"—*nebulo hebdomadarius*—and a "scoundrelly snob," if so we may render *syccophanta deterimus*. But, as to the *Gazette*, Patin writes:—"Nothing is successful here, unless it be the *Gazette*, which is extremely amusing and consolatory too, for this chattering journal never gives any bad news, though we know there is plenty of it just now." Thus Renaudot anticipated what we have always believed to be likely to prove a successful plan of journalism. There should be a rose-tinted paper which only publishes the good news. All our failures, defeats, evasions, all our purchases of 15,000*l.* worth of American contempt, all our scuttlings, explosions, fiascos, should be steadily ignored. At present correspondents have an invincible trick of telling not only the truth, but the whole truth, and *novellistes* in Merv or Tunis write as if they did not care a pin for the feelings of party men, Liberals or Conservatives. Our favourite rose-coloured print should be called the *False Prophet*, and should far excel the *Times* in the art of prophesying smooth things. This art seems to have been known to Renaudot, who, as the dependent of Richelieu, could not be an independent journalist, and must have "edited" his foreign correspondents' letters pretty severely. In 1642 Renaudot brought an action for libel against Gui Patin, who, in a Latin preface to the works of Sennert, had styled him a *nebulo*, and a *blatéro*, which may be interpreted in the idiom of Burns a *bletherer*. Patin defended his own case, and had the better of the argument. He boasts that he has pulled Renaudot's nose (a pug), and adds that the gazetteer "*habet frontem meretricis, et nescit erubescere*," so early is the phrase which speaks of "pressmen and prostitutes." Renaudot had two advocates; but they failed to prove that *nebulo* and *blatéro* were injurious terms. Yet neither of them seems exactly complimentary. When the Père Joseph, Richelieu and Louis XIII. died, Renaudot found himself alone in a world of enemies. He was prohibited from exercising his profession of physician. His *mont de piété* was closed. Patin now called him an *ardelio*, which sounds libellous, but only means a busybody. But the *Gazette* did not cease to live, and was patronised by Mazarin, as it had been by Richelieu. Renaudot, foreseeing the immense power of his new engine, took a very high line, not unlike that of the modern press, with kings and statesmen. "I have to request princes and foreign States not to lose time in trying to shut out my news, for this is a sort of merchandize that custom-houses cannot detain, and which, like torrents of water, waxes stronger as you try to resist it." In later days, Renaudot anticipated a modern organ of evening Liberalism by starting a halfpenny paper—*Le Courrier Français*—which was hawked in the streets, and greedily purchased by a people avid of news. "On n'entendait, les vendredis, crier autre chose que le Courrier Français." Renaudot died on October 25, 1653. His career had certainly been a remarkable one. He had invented publicity. And this he had done but incidentally and

by the way. His real business was that of medicine, in which his innovations were practically successful. He was probably unaware, in spite of his arrogance, that he had been the author, as Mr. Carlyle would have said, with his usual geniality, of Satan's Invisible World Displayed. All editors, special commissioners in the Transvaal, and elsewhere, all penny-a-liners, all they that write leading articles, or speed the light *canard*, are his spiritual offspring. Renaudot died, according to Patin, *genux comme un peintre*, but probably it was a last stroke of malice to aver that the *nebulo*, *blatéro*, *ardelio*, *fourbe* did not "cut up well." Renaudot may have been less successful, as far as worldly wealth meant, than many of his successors as founders and proprietors of newspapers. Till 1789, when the word *journalisme* came in, his *Gazette* continued to be the chief French political paper. This was rendered the more easy by the privilege which forbade any other political journal to be printed in Paris. The Dutch press, however, used to pour out little journals which were mere collections of political slander. Louis XIV. was their chief victim, and, with a touch of human nature, the King, as Saint-Simon says, used to have all the *Gazettes étrangères* read aloud to him. It is strange to think of the old king wincing under his periwig and silk lace at the attack of some ragged and starving garretier. By this date the modern press, the pestilence that walketh in darkness, was full grown, and as active after its kind as the Nihilist pamphlets that are read to the Emperor of Russia.

THE YACHT-RACING ASSOCIATION.

RATHER more than two months ago there appeared in the *Field* what at first sight looked like a drawing of one of the wine-glasses of the old Beefsteak Club—that is to say, a wine-glass with the foot broken off, so that the drinker therefrom might not indulge in the ignoble practice of leaving heel-taps. The description which accompanied this sketch showed, however, that it did not represent a relic of the joviality of the past, but the midship section of a yacht, the body in outline precisely resembling the bowl of a glass, and the keel in section the stem. The marvellous vessel thus delineated was called the *Evolution*; and, though the name is not yet known to the outside public, it has already become famous in yachting annals, for, albeit of only 10 tons measurement nominally, this cutter has, we venture to say, caused more excitement and discussion amongst yachtsmen and yacht-builders than any other craft which has appeared since the days of the *America*. The *Evolution's* designer, Mr. E. H. Benthall, had apparently been guided principally by a desire to take the fullest possible advantage of the present rule of measurement, and she has accordingly enormous length in proportion to her beam. To give her the requisite strength a very ingenious expedient has been adopted, the vessel being, so to speak, built on to a girder. It is not, however, to this novelty in construction, striking as it is, neither is it to the not very remote possibility of the *Evolution's* losing her mast in a gale, that the attention which the yachting world has given her or the excitement which she has caused is due. The *Evolution* has become celebrated because she has been the means of bringing to a crisis the controversy respecting the rule of measurement which has continued for so many years; and there is unfortunately only too much reason to fear that she may be further celebrated as having indirectly been the cause of much injury to the prestige and credit of a body in which hitherto many yachtsmen have had unflinching belief, to wit the Council of the Y. R. A. In designing his remarkable vessel, Mr. Benthall showed in the most emphatic manner what could be done under the Thames rule of measurement, or under that modification of it which is known as the Y. R. A. rule of measurement. It is not remarkable that many took alarm, and that there was much excitement and discussion; and it is not to be regretted, that a glaring example set clearly before the eyes of all should have made the necessity for change obvious, and well nigh indisputable. It is remarkable, and it is to be regretted, that the body which was supposed to be better qualified than any other to deal with the question should have behaved with such vacillation and inconsistency, and should have tolerated such eccentric conduct on the part of one of its members as to shake altogether the confidence which has hitherto been reposed in it. We certainly shall not be accused of any hostility to the Y. R. A. We believe their rules to be the best which exist for the management of yacht-racing, their time allowance to be the fairest; and not long ago we endeavoured to show that clubs would do well to adopt them. It is with the deepest regret that we feel called upon to criticize the recent conduct of the Council; but, unfortunately, criticism is unavoidable if there is to be any fairness in the treatment of the question. The Y. R. A. endeavour to correct the mistakes of clubs, and they cannot complain if the mistakes of their Council are pointed out; and that their Council have of late made grievous mistakes will, we think, be evident from a recapitulation of what has happened. In order to make this clear to readers who have not followed the subject, we must go back some little way, and state some facts which are already trite to those who have given attention to this question.

Early in the present year the Council of the Y. R. A. became convinced of the necessity for a new rule of measurement, and, after consideration, accepted one which was suggested by the Secretary of the Association, Mr. Dixon Kemp, a gentleman as

competent for the task of devising a system of measurement as could possibly be found. According to his proposed rule, which has perhaps been more discussed than any other rule that ever was proposed, the square of a vessel's length was to be multiplied by the extreme breadth and the product divided by 1,200. How far the Council, in considering the matter, had been influenced by tidings of the design of the *Evolution* and other vessels we are not aware, but certainly it was the *Evolution* which made the necessity for change generally obvious. The new regulation was brought forward by the Council at a general meeting of the Association, and it was decided that the question should be referred to the whole body of members, and that a two-thirds majority should be required to carry the proposed rule. In an article written at the time we commended this decision, as it appeared to us that further discussion could do no harm, and that it was highly desirable that the authority of the Association should not be impaired by anything that bore the semblance of precipitate legislation. The events which followed this not unreasonable decision were, however, most singular, and it is to be feared that their result has been sadly to shake the credit of the Council. While the vote was still pending Colonel Leach, not a yacht-owner, who is, it seems, the honorary treasurer of the Association, and, for this reason we presume, a member of the Council, thought fit to send round a circular which virtually urged members to vote in the negative. The ambiguous wording of this circular, which was such as possibly to produce the impression that it had the authority of the Council, led to its being immediately repudiated by the Marquess of Exeter on behalf of the Council; but a good many votes may have been sent in under a false impression before the official notice was received, and clearly no reliance could be placed on a decision which might have been wrongly influenced. Of the impropriety of the conduct by which this unfortunate state of things was brought about it is unnecessary to speak. We do not, of course, impute for an instant anything like *mala fides* to Colonel Leach, but it is clear that he took a most mistaken course.

Any harm which might have been done could, however, easily have been remedied; and nothing need have been said about the matter but for the strange behaviour of the Council of the Y. R. A. That body, as has been shown, brought forward, after full deliberation, a rule of measurement. One of their members thought fit, without resigning his place on the Council, to issue a circular virtually urging members of the Association to vote against the rule, and this circular the Council immediately repudiated. As the voting had possibly been improperly influenced by it, and as the two-thirds majority did not appear to be necessary, a special meeting was demanded to reconsider the question and to put the Council's rule fairly to the vote. This requisition was a very proper one, as it was only right that the Council should be supported, and that there should be an unbiased decision on the rule they had brought forward. Strange to say, the Council, when an attempt was being made to uphold their authority, made a sudden *volte face*, and declared that they would rather it was set aside. A notice was published, from which it appeared that the Council intended to give their own rule the go by, and to propose almost exactly what Colonel Leach suggested in the circular which was so strongly objected to. At this meeting, according to the *Times* report, a resolution was carried which declared that the vote already taken had been wrongly influenced and was therefore null and void. A committee list proposed by the Council, in which appeared the name of Colonel Leach, who had not resigned his place on the Council, was not accepted, and it was determined that the task of preparing a new rule of measurement should be assigned to a committee appointed by the vote of the whole body of members.

We do not desire to consider at present the merits or demerits of the Council's rule or the advisableness of further consideration. What unhappily it is necessary to speak of now is the singular conduct of the governing body of the Y. R. A. In this case it is to be observed that a certain number of members who desired to support the Council called for a general meeting, whereupon the Council imitated the famous person who turned his back upon himself, and accepted the proposition contained in a circular which was issued to defeat their own proposal. One of two things, then, is certain. Either they are entirely wrong in their sudden change of course, or else originally they brought forward their rule without proper consideration. Whichever view be taken, there can, we fear, be little doubt that their authority must be sadly weakened, and this is greatly to be regretted. The clubs whom the Y. R. A. seek to influence are not likely to overlook the vacillating and inconsistent course of their rulers, and, indeed, the fruits of this are already apparent. It seems, from a letter in the *Field*, that another misleading circular has been issued with the object of influencing members in voting for the proposed committee. The result of the vote was, we believe, announced this week, but we are not aware who were selected. If, however, it should appear that the voting was influenced by the circular, everything will have to be done over again. It may very safely be assumed that this second irregularity would never have occurred had it not been for the weak conduct of the Council of the Y. R. A.

It is hardly necessary to point out that this is not a private question such as sometimes arises between a committee and the members of a club. Were it so, it certainly would not be treated in these columns. The Y. R. A. is a public body, which seeks to regulate yacht-racing all over the coast, and the question of measurement is assuredly not a private one. The proceedings of

the Council which represents the Y. R. A. are then a fair subject for comment, and unhappily are, as has been shown, open to comment of the most unfavourable kind. How the Association can expect clubs to pay them universal obedience when their Council does not know its own mind for a few weeks together, and when a single member is allowed to oppose the body to which he belongs and seemingly to prevail, we are totally unable to conceive. The *Evolution* caused infinite dismay and commotion, and inspired yachtsmen with just fear. In their distress they looked to the Y. R. A. to help them; but it is to be feared that the strain of attempting to do so has been too much for that institution. We trust that in the end it may again inspire confidence, but at present its position seems to be a critical one. To use a nautical simile, those in charge of the ship have got her in irons, with the shore a great deal nearer than is pleasant, and this is greatly to be regretted; but fortunately everything may yet be brought to a satisfactory conclusion if, as is most probable, the members of the Y. R. A. have made amends for the errors of their rulers by appointing a good committee. It should not be a task of great difficulty to select from their body men quite competent to settle this question—and settled it should certainly be—or else there is danger that the sport of yacht-racing may become ridiculous by leading to incessant dispute. Recent events, into which it is not necessary to enter now, show that it is imperative that there should be a uniform code of rules, and a uniform time allowance. The necessity for a uniform rule of measurement and for an alteration of the present system is scarcely less apparent, and it is therefore greatly to be hoped that the members of the Y. R. A. have elected a thoroughly competent committee. That body will have in one respect an enviable task, as it will be in their power to put an end to disputes of long duration, and to make yachtsmen forget the unfortunate vacillations of the Council by producing a really satisfactory rule of measurement, which, without making *Evolution* impossible, will assign to them their proper place.

THE DERBY.

THOSE people who only take an interest in the Derby on the day of the race are like novel-readers who content themselves by reading the end of the third volume of a story. They may enjoy the excitement of the grand finale, they may take pleasure in the evident blighting of many hopes, and in the solution of a problem which has given them no trouble; but, after all, they cannot derive the same interest from the conclusion of the narrative as do those who are well acquainted with the actors in the drama, as well as with the complications, the virtues, and the villainies of the plot. The Derby may be said to be a long story, beginning about a year before the actual day of the race. The first scene bearing on the Derby of 1881 was the race for the Twenty-third Biennial Stakes at Ascot in June 1880. This race was worth more than 1,000*l.*, and nine two-year-olds came out to contest it. Of these the favourite was Angelina, the winner of the Woodcote Stakes at Epsom; but the winner proved to be Sir Charles, a good-looking colt by Pero Gomez. A couple of days later came the New Stakes at Ascot, another valuable race, worth 1,322*l.* For this Tristan, who had beaten Angelina at Newmarket, was the first favourite, after whom Angelina and Sir Charles were equal favourites. Again Sir Charles won, Tristan being second and Angelina third. After this race Sir Charles was established as first favourite for the Derby, and he was at once backed to win 6,000*l.* at the short price (for that length of time before the race) of 10 to 1. After winning another race at Winchester the favourite met with defeat at Goodwood, where he ran extremely badly, and he never ran again as a two-year-old. In July a two-year-old filly of extraordinary merit began her career. This was Bal Gal, who unfortunately became a roarer; she was far the most successful two-year-old of the season. If she had kept sound, she would undoubtedly have been first favourite for the Derby. A colt that showed some form in July and August was Scobell, who, after winning a couple of races at Stockbridge, ran a dead-heat with Wandering Nun and Mazurka for the Astley Stakes at Lewes. In this race Thora and Cumberland ran a dead-heat for second place, being only a head behind the three leaders. We may observe that this was one of the finest races ever seen on the Turf. In the Richmond Stakes at Goodwood, Scobell ran within three-quarters of a length of the flying Bal Gal. Another colt that occasionally ran in good form was Iroquois, who ran Bal Gal to a head in the July Stakes at Newmarket; but his form was very unequal, and he ran badly at the end of the season. In October came the race which was intended by its founders to be the great Derby Trial Stakes for two-year-olds—namely, the Middle Park Plate. St. Louis, a colt by Hermit, galloped in three lengths in front of the nearest of his sixteen opponents, Town Moor being second. In the Houghton Meeting, when meeting St. Louis at an advantage of 9 lbs., Town Moor subsequently beat him by half a length. St. Louis was also beaten in the Dewhurst Plate, but he was again heavily weighted. In the Newmarket Houghton Meeting the Criterion Nursery Stakes was won with extraordinary ease by a horse called Geologist. His previous running had been nothing to boast of, but now he cantered in six lengths in front of Thora.

Early in the winter months St. Louis was first favourite for the

Derby. As time progressed, there were rumours that he was not quite sound, which were followed by counter rumours that he was in perfect health. After this, sometimes St. Louis, sometimes Sir Charles, and sometimes Scobell was the first favourite. At one time hopes were entertained that, after all, Bal Gal was not a roarer; but they were of short duration. Geologist became rather a favourite as the spring advanced, as also did Peregrine, a horse which had not yet run in public. There were only two races at the Craven Meeting which threw any material light upon the Derby. One was the Craven Stakes, which brought out Lord Rosebery's Cameliard, a well-shaped bay colt by Cremorne, who, after starting third favourite, beat a moderate lot of horses. The other was the Biennial, in which Tunis beat Montrose (who had won the Great Sapling Stakes of 1,000 sovereigns at Sandown Park), Great Carle, the winner of the Home-Bred Produce Stakes at Newmarket, and several other horses. After the race Tunis was backed at 15 to 1 for the Derby. The next event of importance in connexion with the Derby was the Two Thousand. For this race St. Louis was a strong first favourite during the Craven week, Bal Gal being a good second favourite. The next week saw the dethronement of both these favourites. Bal Gal was tried in a perfectly open manner, and was ingloriously beaten; and St. Louis threw out a splint, had to be blistered, and was consequently stopped in his work. This, of course, completely changed the aspect of both the Two Thousand and the Derby. As we observed in a former article, the Two Thousand was very easily won by Peregrine. Three lengths behind him was Iroquois, and a length and a half behind Iroquois came Don Fulano, who was only a head in advance of Cameliard. Scobell and Golden Plover, who had started first and second favourites, were unplaced. Several other horses of note were also hopelessly beaten; among these were Tristan, who had shown some form last year, Wandering Nun, and Cumberland, who had been among the five horses that ran within a head of each other in the memorable Astley Stakes at Lewes, and Town Moor, who had beaten St. Louis in the Post Stakes at Newmarket. Two days after came the One Thousand Guineas. Thebais, the winner, was a very great favourite, but even the roaring Bal Gal and Lucy Glitters were supposed to be better than Thora; nevertheless, Thora made a very good race with Thebais, only being beaten by a neck. We have already observed that Geologist had beaten Thora by half-a-dozen lengths in the Criterion Nursery Stakes. Now, therefore, Thora's excellent running with such a smart filly as Thebais, seemed to prove that Geologist must be a horse of extraordinary merit. The result of all this was that Peregrine became a very firm first favourite for the Derby, Geologist being second favourite, while Iroquois, Sir Charles, and Cameliard were for some time the next in demand. Excuses were made for Cameliard's indifferent running in the Two Thousand. It was said that his jockey had eased him when he found that he could not win, and that he was better suited for a long course than for a short one. The position of St. Louis in the betting market varied almost from day to day. After some delay in his training he again got to work. His chance was debated with great eagerness among both his friends and his enemies. The latter said that after a suspension of his preparation so near the time of the race it was impossible that he could be made as fit as he ought to be by the Derby day; while the former argued that his sire, Hermit, had won the Derby after breaking a blood-vessel, and lying idle until very near the day of the race. From a fortnight to ten days before the Derby there were several mishaps among the Derby candidates. At the Newmarket Spring Meeting, in the Payne Stakes, Tunis, the first favourite, broke down, and was afterwards scratched for the Derby, and Scobell, the second favourite, ran too badly to have any great hopes of winning the great race at Epsom. Golden Plover injured himself in some manner at exercise, and had to be shot.

Early in the Epsom week, Sir Charles, against whom, as we have already observed, as little as 10 to 1 had been laid almost a year ago, was scratched. It is said that he had been beaten in a trial. Barrett, an American horse, who had been heavily backed at 20 to 1, was scratched on the same day. On the morning of the race, Cameliard was found to be lame and was scratched. After all these reductions, only fifteen horses went to the post. There was some delay in clearing the course, so the start was behind time; but after one failure the horses got off on very equal terms. Iroquois was the first horse to break the even line of heads by going to the front; but in a couple of hundred yards another American horse, Marshal Macdonald, took the lead, and began to make the running for Iroquois. His exertions, however, were uncalled for, as St. Louis went to the front at the top of the hill, and made the running manfully down the incline by Tattenham Corner into the straight. There he began to show symptoms of distress, and for a moment or two the lead was taken by an extreme outsider called Voluptuary. Scobell and Town Moor then came forward; but, although they were leading when so near the winning-post, they were running like beaten horses, while Peregrine and Iroquois were close to them, and were evidently only waiting their time to shoot to the front. Half way up the straight Peregrine rushed forward, and held the lead as far as the distance; but Iroquois followed him very closely, and, as they came near the winning-post, passed him without any great difficulty, winning by about half a length. "The Britishers were whipped," for Iroquois was bred in the United States, and he belongs to an American. Late at night a Transatlantic telegram announced that processions were perambulating the streets of New York in honour of the victory. Leamington, the sire of Iroquois,

won two Chester Cups and the Goodwood Stakes. Iroquois's dam was descended from the famous West Australian, who won the Two Thousand, the Derby, and the St. Leger in the year 1853. Iroquois was ridden by Archer, who rode Bend Or to victory in the Derby of last year, as well as Silvio in that of 1877. The result of the Derby would appear to show that, while Peregrine possesses great speed, Iroquois is a better stayer. Both Iroquois and Peregrine are good-looking horses; but the general opinion among good judges of racehorses is that they are inferior to the average of Derby and Two Thousand winners. Town Moor, who was third, is a powerful horse, 16 hands high, with a great deal of bone; but he has high galloping action, which is a decided defect in a racehorse. Several competent authorities consider the field, as a whole, to have been the worst that has taken part in a Derby for many years. The day was intensely hot, the dust was suffocating, and the course was as hard as iron.

The Derby would be incomplete without the annual wrangle in the House of Commons on the question of taking a holiday for the occasion. We have nothing to say against the customary adjournment on the Derby day; but it seems to us that those who profess themselves so anxious to economize the time of the House of Commons that they grudge the Derby holiday on the Wednesday are a little inconsistent in annually wasting a part of the Tuesday as well. The debate on the Derby is always a useless waste of time, and on Tuesday last the debate on the Irish Land Bill was considerably delayed, while two members made long speeches and stupid jokes about bawling blackguards, ancient Britons, Sabbatarianism, Saints' days, Nonconformists, and various other subjects, under pretence of opposing or of supporting the Derby adjournment.

THE RISE IN SECURITIES.

THE rise in the prices of Stock Exchange securities continues. It is now just two years since the movement began. It was in the May of 1879 that there was the first symptom of a revival of speculation after the long depression and discredit. The speculation quickly died away, but it began again in the following September, and has since continued to gather strength. It may be worth while to give some instances of the extent to which it has now proceeded. In the two years Consols have risen 3½ per cent., while the New Two and a half per Cents. have risen 10½ per cent. Indian Four per Cents. have risen 2 per cent., Cape of Good Hope Four and a half per Cents. have risen 5½ per cent., and Queensland Fours have gone up 8½ per cent. Amongst English Railways, again, London and Brighton Ordinary shares have risen over 12 per cent., London and North-Western about 14 per cent., Metropolitan about 5 per cent., and Metropolitan District about 20 per cent. In Scotch Railways, however, with the exception of Glasgow and South-Western, the rise is trifling; and in the principal Irish lines there is actually a fall. Nor is this movement by any means confined to our own market. On the contrary, it is still more marked in New York and in Paris. French Three per Cents., for instance, have risen over 6 per cent., or nearly twice as much as Consols, and Bank of France shares are gone to a premium of 470 per cent.; while United States bonds have appreciated so much that the Government has been able to refund the Fives and Sixes at 3½ per cent. And it is expected that next winter a further reduction of interest to 3 per cent. will be effected. Moreover, New York Central shares have advanced 40 per cent., and Illinois Central nearly 70 per cent.

The phenomenon being thus general, it must have general causes. Amongst these the principal is the great scarcity of first-class securities. Since the French Indemnity Loans were raised there has been no issue on a large scale of really sound investment stocks. On the contrary, there has been an enormous diminution in several instances. The United States Government, for example, since the close of the Civil War, will have paid off about 180,000,000*l.* of its debt when the present funding operations are ended, and, at the same time, it has reduced very greatly the interest upon the remaining debt. United States bonds were previously held extensively in this country, in Holland, and in Germany; but, as the redemption of the principal and the reduction of the interest went on, the bonds were taken away from Europe. The banks of the United States are compelled to hold Government securities or else to give up their note circulation; and trustees, insurance offices, and similar institutions are obliged also to hold these bonds. The result has been that the bonds in the hands of the general public have been very largely called in and paid off, and that their place has had to be taken by other securities. While this was going on, the growth of population and wealth has been enormous. Since the last census was taken a population larger than those of Ireland, Scotland, and Wales all put together has been added to the population of the United States. And the accumulation of wealth has been in greater proportion still. Thus, while the number of investors and the means of investment have been enormously increased, the really sound securities within their reach have been very greatly diminished. Necessarily, therefore, a great demand has arisen for other good securities, such as State and city bonds and railway shares and debentures. The rise in all these good securities naturally led to a rise in the less safe securities, and has ended

in great inflation. Here at home, too, there has been a considerable reduction in the debt, though nothing like what has taken place in the United States. Mr. Gladstone now proposes to turn 60 millions of Consols into terminable annuities, and in four years more he or his successor will have at his disposal 4 millions a year with which to effect a still greater reduction in the debt. This, added to the redemption of the United States debt, has greatly diminished the available investment stocks, and consequently has driven all who are not absolutely compelled to invest in Government securities to put their money in other things which would give them a better return. There is nothing, therefore, surprising in the great rise that has occurred in first-class railway debentures and shares. When Consols yield only about 2½ per cent., it is not unreasonable that 4 per cent. should be considered a very satisfactory yield from such railways as the London and North-Western. And while this reduction of the National Debt has been going on, it may almost be said that the building of railways has ceased. There are still, of course, small additions made to our network of lines, and there are constantly emissions of new capital to build stations and make other improvements, but the construction of main lines has ended. In France the growth of the debt steadily goes on, but the growth of wealth is still faster. And in Italy the chronic deficits, which lasted so long, have been brought to an end. There is a balance now between income and expenditure, and preparations are being made for the resumption of specie payments. In fact, Italy has ceased to be one of the borrowing countries, and is fast becoming an investment or capitalist country. There is thus a basis for much of the rise that has taken place, though, of course, like everything else, the rise itself has been pushed too far.

Another but more temporary cause of the movement we are tracing is the cheapness of money. For a considerable length of time now the discount rate in the open market in London has seldom for a month together exceeded 2 per cent., and has generally been lower. It is natural, therefore, that banks, with large deposits on which they have to pay interest, should prefer to lend upon stocks on which they can obtain from 2½ to 4 per cent. rather than compete with one another for bills which would yield them probably not half as much. The depositors themselves, too, are dissatisfied with the low rate of interest which the banks are able to allow them, and either lend upon the Stock Exchange themselves or speculate with their savings in the hope of increasing their capital. As long as this great cheapness of money lasts there must be an upward movement in securities. It would not be natural that money should be lendable in the short loan market in London for any length of time at 2 per cent. or less, while good securities were paying 5 or 6 per cent. A third cause of the rise is the badness of trade. When trade is very active traders put all the money they can scrape together into their business. They are anxious to build new mills, to increase their machinery, to extend their business in every direction where it seems likely to pay. And they not only put in all their own savings, but they use their credit also for the sake of the profit they see in prospect before them. When, on the contrary, as for several years now, trade is dull, a much less capital is all they require, and consequently they have to look about them for other employment for their savings. They have, therefore, put their money into stocks, and have thus augmented the demand which, as we saw, is very real and very powerful. This demand, of course, is temporary. If trade were to improve, one of the first consequences would be that merchants and manufacturers would sell out of some of the stocks in which they have now temporarily invested to put the proceeds in their business. This has always to be borne in mind; and if, as we may hope now, the coming harvest is a good one, and gives the stimulus to trade which is universally looked for, we may expect that considerable sales of securities will ensue, and that the rise in prices, which has gone on now for nearly two years, will receive a check. In another way, too, the improvement of trade will check the rise. It will cause a demand for money, will enhance its value, and will thus make people dissatisfied with the low interest which is now all that can be obtained from first-class securities.

These are the broad and general causes of the rise we have witnessed, and which is causing so much surprise and so much anxiety in many quarters. They are neither reprehensible nor immoral; but they warn us that at any moment the rise may be checked, and may be followed even by a considerable fall. As yet we do not think that here in England there has been any very wild speculation such as would cause a panic, provided, of course, there were to be no great political disturbance. It may be different in France and in the United States; but here in England, as yet, the causes that have been acting are such as made a great rise inevitable as soon as the extreme discredit caused by the Glasgow Bank failure passed away. And one of these causes will continue to act as long as there is no great fresh creation of securities—we refer, of course, to the scarcity of first-class securities. If there were to be a great European war, with its enormous issues of loans and its waste of capital, of course the value of money would be raised immensely, and all prices must inevitably fall. But, if there is not such a war—if, on the contrary, the prosperity that is now extending throughout the commercial world continues, and is availed of to reduce the debts of the first-class States, sound investments must command a high price. As we have already said, the improvement of trade, however, will tend to check a further great rise both by opening up new channels for the employment of money, and thus raising its value, and by diverting from the Stock Exchange funds which

are now poured into it in immense volume. But even the improvement of trade may have a less effect than is expected. The conditions under which trade is now carried on are greatly changed from what they formerly were. The telegraph, the railway, and the steamship have revolutionised the methods of commerce. It is no longer necessary to keep enormous stocks on hand, or to provide long beforehand for the business of a season. Orders can be transmitted from London to Calcutta, Melbourne or San Francisco, in a few hours, and payments can be made with equal speed and by the same means. So, again, in the course of a few weeks cotton or corn can be brought from distant continents to Europe. There is thus an immense economy of capital. There is no need for locking up vast sums of money in stocks that will not be used for months to come. Nor are the enormous warehouses necessary that would be required were the present volume of trade to be done on the old system. It may be doubted, therefore, whether even brisk trade will have the effect that many expect from it, though, of course, it must divert capital from the Stock Exchange to commercial business, and thus enhance the value of money. In the long run, by raising the value of money and making it scarce, it will bring down prices, and may possibly even produce the crisis which is so freely predicted now; but, if politics run smooth and no accidents occur, the crisis may be postponed much longer than many of the prophets seem to think possible.

RECENT MUSIC.

LAST week Mme. Sembrich made her appearance, which had been unavoidably postponed, in *Dinorah* at Covent Garden. The marvellous facility with which this singer overcomes the vocal gymnastics that are assigned to the part by the composer was as marked as when she was heard for the first time last year in *Lucia*, and the applause with which she was greeted was as well merited as upon that occasion. Save for the popularity of one or two songs which the opera contains, we doubt whether it would be worth the trouble to a great singer to study such a part as *Dinorah*, so devoid is it of dramatic interest and replete with absurdities. In these circumstances, perhaps, it was not unnatural that Mme. Sembrich should have been unconscious of the comic effect produced by the repetition of the "Shadow Song," which involves the reproduction of that most accommodating of moons and breaks the thin thread of dramatic interest which may be found in this opera. The same remark, of course, applies to M. Lassalle's encore of "Sei vendicata assai." Bearing in mind M. Lassalle's really fine representation of Nelusko in *L'Africaine* last year, we must admit that we were very disappointed at his rendering of Hoel in this opera. M. Lassalle appeared to us to have lost interest in the work he had undertaken, and had become mechanical and conventional. It was only when he had a song which was worthy of his great powers that he really exerted himself. In stage language, in fact, he simply walked through his part until he reached "Sei vendicata assai," which was duly acknowledged by the audience, and, as we have said before, was marred by the repetition. Mme. Trebelli took the part of the Goatherd—an insignificant part, which she raised to importance by her wonderful powers of vocalization and acting. Signor Marini's Corentino was not of the best. We would suggest that it would be advisable for Signor Marini to give some attention to the conductor's beat, especially at the close of the first act, when in his agony of fear he drops on his knees and invokes all the saints in creation to have mercy on him. For want of this one of the most comic situations was completely marred. Mlle. Valmi was a competent Capraja, and M. Dauphin and Signor Corsi gave intelligent renderings of the parts assigned to them.

Lohengrin has been performed at Covent Garden with two new singers, Herr Labatt of the Vienna Opera, and M. Dauphin. Herr Labatt, who is, we believe, a Swede, has been one of the leading dramatic tenors of the German stage for about thirteen years. Herr Labatt shows us a somewhat new reading of the part of Lohengrin. His Knight of the Swan is, judged by his second representation of the part, when he had overcome his first nervousness, full of human feeling and passion, his high and supernatural character being only indicated from time to time. Telramund and Ortrud are treated with contemptuous loathing, finely expressed in the duel scene by throwing the sword and shield down the instant Telramund falls, as if they had been polluted by being used against such a creature. Again, at the end of the last act Herr Labatt represents Lohengrin almost overcome with grief at the loss of Elsa, grief so deep that his sense of his high mission, to which he is recalled, can only by a struggle reassert itself and restore him to saddened dignity. His farewell to the swan was full of feeling, and produced the effect that was desired; whilst Mme. Albani's Elsa was as fine a rendering as she has ever given. The touching scene where Telramund accuses her of her brother's death was given with all the dramatic power that she has now become celebrated for, and the dreaminess of her vision of the Knight who was coming to deliver her was exquisitely depicted. Again, when he does not appear as she expects, her amazement without loss of belief was most admirably represented, whilst her expression of joy at his arrival is perhaps unsurpassed on the operatic stage. M. Dauphin, at the second performance, as the Herald, had much improved upon his first representation, from the fact, doubtless,

that he had become more familiar with the vast stage of the Covent Garden Opera. Signor Silvestri took the part of the King, and Mlle. Mantilla and Signor Cotogni were respectively Ortrud and Telramund.

M. Dupont conducted the performance in a manner to increase his already high reputation—his skill as an accompanist, which we have before noticed, being again shown in a most marked manner. It would appear that the stage manager of the Royal Italian Opera has a special spite against first acts. He is trying hard to make the first act of *Lohengrin* as ridiculous as he has already rendered the first act of *Faust*. When the lists have been measured out, the Herald makes proclamation that all must stand outside the lists on pain of death to arms, and loss of the right hand for freemen. The instant that this proclamation has been made, the stage manager causes everybody on the stage to walk into and through the lists, and has now gone so far as to make the knights, who have marked out the space, remove the lances which mark out the lists, so as to give greater freedom of circulation.

Mlle. Adalgisa Gabbi has made her appearance at Her Majesty's in the part of Aida, and appears to please her audience. She has a beautiful voice, and at times sings well; but from some cause, or more probably some combination of causes, her power of singing frequently leaves her altogether, whilst the quality of her voice becomes extremely harsh. Her dramatic power is very great, and she is gifted with expressive mobile features. Indeed, we have seldom seen the part better played. Mlle. Tremelli was Amneris; and, though her performance was, on the whole, stagey and forced, yet she deserves great praise for the scene during and after the judgment of Rhadames. The general performance was very good. Signor Arditì has obviously worked hard with both band and chorus, and has made a great improvement in both.

Mme. Nilsson made her re-appearance in *Faust*, which has been given with a cast exceptionally good, save for the absence of Mme. Trebelli. It might well have been thought that there could be nothing new to say concerning the poetry and tragedy which, with the most finished artistic skill, Mme. Nilsson imparts to the character of Marguerite. Yet there are some dramatic touches which to us at least are new—notably in the scene of the ballad of the King of Thule, and which added yet another grace to a performance which before had seemed perfect. To speak of the power and exquisite delicacy and tenderness of Mme. Nilsson's singing of the part would be only to repeat what we have often said before. Mr. Maas re-appeared as Faust, and sang the music of the part with fine perception, and with thoroughly-trained use of a pure tenor voice, which is now a rare possession. His acting still leaves much to be desired; but it is well to remember that Signor Mario began his career as a poor actor, and ended it as an exceptionally fine one. Signor Novara appeared as Mephistopheles. We do not hesitate to say that dramatically he is the best Mephistopheles who has been seen on the London lyric stage since the absence of M. Faure. From watching his performance one may naturally infer that he has studied not only the work of MM. Barbe and Carrier, but also that of Goethe. His acting is throughout original, without any suspicion of eccentricity, and is throughout in accordance with what we take to be the right conception of the spirit that denies as represented in the person of Mephistopheles. His command of gesture and facial expression is unusually complete, and in its employment he never sacrifices truth to making of points. The praise that we can accord to his singing is less only in degree. He used a fine voice, on the whole, with much art and steadiness. The "Dio del or" he sang, as well as acted, capitally, and in the recitatives he was admirable. It is difficult to judge how much of his comparatively limited success in the serenade was due to the extraordinarily bad accompaniment conducted by Signor Arditì. Signor Arditì's conducting throughout was of a flabby kind, and also went far to spoil Signor Del Puente's fine performance of the death scene of Valentino. In spite of Signor Arditì's conducting, the chorus showed a marked improvement.

The second Richter Concert consisted of Brahms's Academic Overture, Leslie's "Mephisto Walzer," the "Siegfried Idyl," and Schumann's Symphony in C. The Academic Overture was written for the occasion of an honorary degree of Doctor of Philosophy which was conferred upon the composer at the University of Breslau in the course of last summer. It is constructed upon the basis of four German students' songs, and, although full of the most masterly work, it is likely to prove somewhat uninteresting to the English public. In the first place, German student songs are not generally known here, and when they are wrapt up in the most intricate counterpoint, or, as in the case of the "Fuchslied," in actual fugue, it is hardly to be expected that it will meet with general approval. The overture, however, is, when understood and read in the light of a work written for a special purpose, a really fine work, and will repay careful study. Of Liszt's "Mephisto Walzer" it is enough to say that the music is worthy of Lenz's idea. Lenz lost his reason in 1844 after having written a wild version of *Faust*, which the writer of the analytical programme tells us he considered "as common property," and therefore a subject to exercise his wild imagination upon. Liszt's production is analogous to Saint-Saens's "Danse Macabre," but wanting in the diabolical humour of that piece. To this followed the "Siegfried Idyl," indeed a poem for the orchestra. This symphonic poem, as it may be called, was written by Herr

Wagner in honour of Mme. Wagner's birthday, after the birth of her son Siegfried, and the completion of the opera of the same name. It consists of themes from the aforesaid opera, but stands as a completely independent composition. The rendering of it by Herr Richter's orchestra was as perfect as possible, as was shown by the way in which it was received by the audience at St. James's Hall. The concert concluded with a magnificent performance of Schumann's Symphony No. 2 in C, which was given with all the vigour and energy for which Herr Richter's orchestra is now famous.

The Richter Concert on Monday, May 30, was a singular example of the art of programme-making. It consisted of Mr. Stanford's psalm, "God is our hope and strength," Liszt's brilliant Concerto in E Flat, Haydn's pleasant Symphony in A Major, and the Overture to *Tannhäuser*—representing the modern ecclesiastical, the virtuoso-technical, our forefathers' methodical, and our own vehemently emotional types. All the works were excellent as representatives of their particular forms of art; but the forms themselves have no sufficient connexion to enable any one to appreciate the advantages of contrast. The Psalm, which is a comparatively early work of our distinguished composer, is the more remarkable on that score for its exceptional clearness of expression and the freedom and facility with which both orchestra and chorus are handled. The first chorus appears to have made the most favourable impression, as it probably deserves to, though there are remarkably happy and broad strokes in several other portions of the work; as, for instance, the gradual rise from the "ppp" to "fff" to the words "Be still then, and know that I am God," which prepares the return of the first phrase, "God is our hope and strength," as the commencement of the final chorus. The performance was, on the whole, admirable, though the singers of the chorus were sometimes inclined to take a more moderate view of the *tempi* than the conductor, and consequently lacked the spring and elasticity which should have rendered the interpretation perfect. The reception of the work was most satisfactory, and the composer had to appear to bow his acknowledgments.

After the Psalm there was a prolonged interval, no doubt to enable the audience to come round to a condition of mind congenial to Liszt—a procedure possibly excellent from this point of view, but likely to be trying to the executant. But, whether trying or not, Mr. Dannreuther was quite master of himself and of the occasion, and the force, clearness, and decision which he displayed would be difficult to surpass. The performance was on every side of the highest description, owing to the exceptional care and patience which had been bestowed on the rehearsal. After this, again, there was a prolonged interval to get into the mood for Haydn, which indeed is a leap of no little difficulty; and all Herr Richter's force and unflinching certainty of interpretation were quite needed to gain the appreciation which was due to work performed. It is in itself of a most enjoyable description, and in some respects larger and fuller than many better known symphonies of the same master. Of the final item in this heterogeneous collection there is little to be said, except that it was as warmly received as ever, well known as it now is. The performance was excellent, and reflected the greatest credit upon the band as well as upon the conductor.

THE THEATRES.

IF *Twelfth Night* had not been performed by the Meiningen Company directly after *Julius Cæsar*, it might have been difficult to avoid judging that the company had been somewhat overrated. Great stress has been laid on the Duke's steady opposition to the so-called star system; and yet the one scene of really first-rate excellence in *Julius Cæsar* owed almost everything to Herr Barnay. The result, too, of putting really good performers into inferior parts is not likely to recommend the practice here. Nothing was gained by putting Fräulein Werner into the insignificant part of Lucius, except the loss of her services where they were very much wanted. Many of the inferior members of the company might have been trusted to act the servant of Octavius Cæsar, if not as well as Fräulein v. Moser-Sperner, at least adequately. In the Saxe Meiningen company, as in others, really good actors are a minority, and they act different parts with very various degrees of sufficiency. It is noticeable, too, that all the performers in *Twelfth Night* had already appeared in *Julius Cæsar*, except three or four.

Leaving aside for a moment the great scene of Mark Antony's speech, the rendering of *Julius Cæsar* on Monday evening was, on the whole, satisfactory enough. Herr Barnay showed great power as Mark Antony, and the Cassius of Herr Teller was decidedly good; but none of the other actors rose above a very moderate level of merit. Their acting was distinctly staid and their elocution monotonous. It suggested a lesson mechanically repeated after a master. The actors turned their backs to one another and spoke into the house; they took attitudes which had no meaning, and used gestures which had neither point nor originality. The few who showed any sign of having formed an individual conception of the characters they were representing gave no proof of very high taste or intelligence. Herr Kober went very near to making a mere buffoon of the "envious Casca." We have seldom seen a tender and beautiful scene more roughly given than that between Portia and Brutus. Cæsar looked at Cassius as if he really did fear him, which

seems to us a decided mistake. The admirably drilled crowd has been much and justly praised, but in the earlier scenes it was used too freely. It was allowed to call off the attention of the audience from those who are carrying on the dramatic action of the tragedy. In the scene of Cæsar's murder it almost hid the conspirators, and was wholly out of place; none but senators should have seen the deed. Loafers, women, and children were not allowed to cover the floor of a Roman Curia. Cæsar, too, was slain with daggers, not swords; and if swords were to be used, they should not have been held like daggers.

At this point, however, the control of the play passed into the hands of Herr Barnay, and till the curtain fell on the third act the performance was really great. Herr Barnay's bearing when he joined the conspirators was that of a man who knows himself in the lion's den, and is conscious that nothing but perfect tact and self-possession can save his life. His suppressed grief and excitement were just sufficiently indicated, and passed into wild lament and rage when he is left alone without any appearance of violence in the transition. The hopes raised by his acting in this scene were fulfilled when he speaks from the rostrum, and lashes the mob into fury from the side of Cæsar's corpse. A large part of the effect produced by this really magnificent scene is due to the thorough drilling and intelligent use of the crowd. They are here very properly in the front throughout, and answer every appeal made to their passions by Antony's consummate oratory, as a fine instrument does the touch of the musician. But it is the player who makes the music, after all. Herr Barnay might have suffered from the want of so good a crowd; but what would even the Saxe Meiningen crowd have been without Herr Barnay? There would have been nothing to justify its tears or rage; as it was, the actor dominated it at its wildest moments.

Although no one particular passage of *Twelfth Night* reached the same level of excellence as this, it was far better played than *Julius Cæsar* as a whole. The actors who had appeared below the level of the tragedy showed to greater advantage in the comedy. Herr Nepper, who had been a poor Brutus, made a well-bred and picturesque Orsino. Antonio was much more within Herr Richard's powers than *Julius Cæsar*. Those who had been lost in the crowded scene of Monday night filled greater parts in *Twelfth Night*, if not with any striking originality or power, at least with spirit and grace. To this there is, however, one exception. Sir Andrew Aguecheek—here rechristened Christoph, for what reason we do not know—was taken by Herr Görner, the Cyma the poet of the previous night. The rendering of the character given us by Herr Görner must be allowed to have the merit of being consistent with itself; unfortunately it is based on a wholly wrong conception. Sir Andrew is own brother to Slender—he is timid, hanging on to Sir Toby Belch, and feebly imitating him, with a weak, intermittent sense of his own folly. Herr Görner gives us an impudent German Bursch, who pushes himself to the fore everywhere, and giggles with an idiotic self-satisfaction. He is frequently funny, but it is not with the right sort of fun. In spite of this exception, however, the honours of the evening were won by the purely comic characters. At first Herr Puckert's Malvolio and Herr Teller's Clown seemed to suffer from the same failing as Herr Görner's Sir Andrew. The Jester was too conscious of his own wit, too much a mischievous sprite. Malvolio was too old and ridiculous. He looked like a disappointed and bilious schoolmaster. But both improved vastly as the piece went on. Malvolio was admirably ludicrous, with a very proper touch of pathos, in the famous garden scene, and the Clown threw himself into the tormenting of his enemy with a zest that was catching. Herr Teller's performance gives a high opinion of the versatility of the actor who had been seen the night before as the grim Cassius. His delivery of "When that I was and a little tiny boy," was especially fine. Herr Hassel's Sir Toby Belch was thought out to the last detail, and given with a fat comicality which causes a laugh in the mere remembrance. But the most brilliant of all this merry crew was undoubtedly Fraulein v. Moser-Sperner. Her Maria inspired and directed the persecution of her natural enemy with an intensity of enjoyment, and triumphed over his misfortunes with a spontaneity of laughter befitting the ideal type of all waiting-women.

The finer and more highly-bred comedy of Olivia and Viola was delicately rendered by Fraulein Bauer and Fraulein Werner. The former looked beautiful and refined, as her part requires; and, if the latter was unduly light and boyish in the very difficult first scene with Olivia, she grew stronger as the piece went on. The stage arrangements were good and intelligent, going carefully into such comparatively trifling details as making Sir Toby and Sebastian (who was marvellously like Viola) engage in the correct sixteenth-century style with rapier and dagger. Altogether, although the patience of the audience was severely tried by the number and the length of the waits, it left with the pleasant sense of having seen perhaps the most brilliant of all comedies most brilliantly acted.

A certain school of dramatic critics have lately been vigorously preaching the doctrine that the plot and the making of a good "curtain" are all the law and the prophets of dramatic literature. The new and original domestic comedy at the Vaudeville has apparently been constructed with a strict regard to this principle. There is nothing new in the characters, unless it is the new name of a very old friend, and there is absolutely nothing original in the dialogue; but the play has a plot, and the second act ends

with a most effective situation. Professor Mistletoe, a puppet-show proprietor, has adopted a daughter, Alice Merton, and educated her out of his savings like a lady. With a very respectable pride, Alice refuses to be a burden on her guardian, and obtains a place as companion in the house of a Mr. Fotheringay Trevanion, a wealthy man of business, with great pretensions and a plentiful lack of breeding. Alice tells the Professor of her engagement in the presence of a Dr. Lattimer, who is a friend of the Trevanions, and immediately drops hints about seeing his way to his revenge. His revenge turns out to be very tame. It is simply this—that Arthur Dalton, Trevanion's stepson, should fall in love with Alice instead of with Trevanion's rich ward, Lydia Penrith. All happens according to the wishes of the Doctor, whose motive for wishing to revenge himself is that Mrs. Trevanion had jilted him a generation ago. Alice and Arthur do fall in love, and the natural complications result. The Trevanions discover the secret just when the Professor has been brought into the house by Dr. Lattimer. Of course a violent scene follows, in the course of which the puppet-show man recognizes Trevanion as the brother from whom he had parted, years ago, at the door of the charity school in which they had been brought up. In the third act all is made right by approved old methods. The upstart Trevanion is ruined, and compelled to beg help from his humble brother—a letter arrives at the right moment, and everything ends happily.

The characters of such a piece as this are not expected to possess much probability; it is enough if they follow certain stock types—and the *dramatis persone* of *Punch* are very familiar figures indeed. There is the comic, but pathetic, Professor whose original is to be found in any of the stories of Dickens. A certain force and interest is given to him by the really fine acting of Mr. James, who has learnt not to overdo such parts by a long familiarity with them. But we doubt whether even his acting will compensate for the total want of novelty. The other characters are either so uninteresting or so unnatural that no acting can make them endurable. But everything was done for them that acting could do by the whole company. The dialogue becomes tedious by mere force of striving after smartness. It is full of efforts after fun introduced at pathetic moments, and puns which have not always humour in the sound and never in the sense. The pathos is of that lachrymose kind which makes the audience welcome a little callous brutality.

Coralie, the version of M. Delpit's *Le Fils de Coralie* given at the St. James's, is a species of *Forget Me Not*, with a suffering and repentant heroine. The dramatic motive of the play is the struggle of an unhappy woman with an infamous past, to secure for her son the happiness which she has deprived herself of any chance of enjoying. This son, Captain Mainwaring, who passes as her nephew, is an officer who has distinguished himself early. When the play opens we find him just engaged to the daughter of a country gentleman, a Mr. Meryon. Although the young lady is very favourable to her suitor, the marriage has not been arranged without difficulty, for Captain Mainwaring knows this much of his birth, that he is illegitimate, and it is only by the strenuous exertions of the romantic Miss Meryon, the aunt of his future wife, that he has gained his object. At this moment Coralie herself appears on the scene as Mrs. Travers, and is warmly welcomed. But among the guests at Mrs. Meryon's house is a Mr. Kelson-Derrick, one of her former victims, who is also a suitor for the hand of Mabel Meryon. Of course Coralie is recognized. From this point to the end of the third act the action of the play consists in her efforts to keep the truth hidden, above all from her son. She has good reason to fear him; for, when Derrick, resolved to get at the truth, describes Coralie with very dubious taste before the whole party, Captain Mainwaring has spoken of such women with loathing. Derrick, who is a man of honour, is induced by his unwillingness to cause suffering to keep the secret, but it is soon learnt by another. This is the family lawyer Critchell, who is put on the track during the drawing up of the marriage contract. He clears up the mystery by the help of a rather ignoble lie, and then the marriage is broken off. The difficulty of the position here proves too much for the dramatist, and, finding his own knot too difficult to untie, he cuts it. Critchell, who has caused all the trouble, induces Mr. Meryon to allow the marriage to go on, and Coralie disappears into a convent.

The piece, though disfigured by a good deal of tinsel sentiment, is undoubtedly interesting, and it is admirably played. Mr. Hare made an excellent family lawyer, and Mr. Clayton as Kelson Derrick looked like a man of the world. As Sir Jonas Meryon, Mr. Wenman played a weak and foolish old man with much delicacy. In the scene where he has to inform Captain Mainwaring that the marriage is broken off, he gave a touching rendering of the struggle between the old man's innate good breeding and his weak wish to shirk a difficulty. Miss Emery and Mr. Kendal made a very charming pair of lovers. If we allow that such a woman as Coralie could entirely cast off her past life, the acting of Mrs. Kendal was admirable. Her interpretation of the heroine's struggling and suffering and shame was full of power, particularly in the scene with Critchell, when she is suddenly brought to the lowest depth of degradation just as success seemed sure.

As far as the afternoon performance of *Much Ado about Nothing* was intended to give an opportunity of judging of the powers of Miss. Ellen, it does not offer much matter for criticism. Whatever the qualities of the actress may be in less exacting parts than Beatrice, and when acting in a language which she can speak

without a marked accent, she has been ill advised in venturing to appear before an English audience in such a character. She has a fine presence, an easy, self-possessed carriage, and a good, well-trained voice; but these qualities are not sufficient for the rendering of Beatrice, and Mlle. Rhea shows nothing beyond them. When she calls on Benedick to avenge Hero, there is no sign of the fire and dignity which should be shown at such a moment by such a woman. Mr. Henry Neville as Benedick only availed himself of the advantage of acting in his own language to interpret his part worse than Mlle. Rhea. His Benedick is an exuberant schoolboy, and as little as possible of a soldier or a courtier. The other parts were more completely filled; but all the actors showed, as was perhaps only natural, a want of study of their parts. Mr. Anson's Dogberry and Mr. Calhaem's Verges were the only exceptions. They were played in a manner to make us wish to see them again in a more carefully prepared performance and more worthily supported. It is to be hoped that this will be the last of the attempts made by foreigners to act in our language, at least before they have mastered it. It is unreasonable to expect us to listen while passages we are familiar with as models of style are delivered with their cadence spoiled and their meaning often lost.

The performance of *Herne the Hunted* at the Gaiety last week was a really remarkable piece of amateur acting. But for the name of Mr. Reece as *collaborateur* we should have said it was also a piece of amateur writing. Perhaps it was wise not to depart too far from well-known lines. The good old burlesque is easier and better followed by an audience which comes to laugh rather than to be critical; and it is easier to laugh at good amateur fooling than at the professional thing, because we all secretly believe that a clown is born to his clownery, whereas the amateurs are followers of serious pursuits. Great praise must be awarded to the company of *Herne the Hunted*. Not only were individual parts sustained with extraordinary spirit and enthusiasm, but the grouping, the readiness and absence of confusion with which most complicated scenes were performed, spoke of long and careful rehearsal. The performance of Mr. Archibald Stuart Wortley as Sir Thomas Wyatt was, on the whole, the most remarkable part of the entertainment. His acting was quiet, easy, and always kept in hand; he delivered his words without effort, and made the most of his points; and he astonished those who were ignorant of the full measure of his accomplishments by dancing like a very Vokes.

REVIEWS.

EIGHTEENTH CENTURY STUDIES.*

MR. HITCHMAN has given us in this bulky volume eleven studies or essays. We have not read them all, for a somewhat careful examination of the first and third has convinced us that he has set up as a teacher of others on a very scanty stock of knowledge. Nay, we will even go further, and say that we have not come across a single fact or a single piece of criticism to repay us for the trouble of reading the eighty or ninety pages through which we have gone. He has, we should imagine, but very lately made the discovery that an eighteenth century must, in the very nature of things, have gone before the nineteenth, and that it must have had a literature of its own. Full of ardour, he has hastily read up all the latest authorities on the subject; and, in a generous spirit, has resolved not to keep to himself the good things that he has found. He is like a cistern in which the escape-pipe should be put at so low a level that it would begin to flow a very few minutes after the supply-pipe had been turned on. Like some others of the brethren of his craft, he is not so careful as might be desired in acknowledging the sources of much of his information. He does even worse than this, for he borrows and at the same time he abuses his creditor. It is not too much to say that his essays on Wilkes and Churchill would have been something very different from what they are now, had it not been the case that long before he began his studies Mr. John Forster had completed his. Yet he thus writes of that eminent author:—"Mr. Forster, in his *Life of Churchill*, has chosen to say some very harsh things of Wilkes, and on no occasion has he expended more bitterness than in dealing with his hunt after promotion." He accuses him, moreover, of having "the desire to exalt the poet at the expense of his allies." We shall, before we conclude, examine Mr. Hitchman's defence of Wilkes; but for the present we must make clear the extent of his obligations to the author whom he thus severely criticizes. We had not read three pages of his book before we felt sure that he was borrowing from somebody. He is describing Wilkes's "admirable social qualities," and he brings forward Johnson as a witness to them. He thus goes on:—"His name," said that great moralist, "has been sounded from pole to pole as the phoenix of convivial felicity." Now here was a misquotation from Boswell; but how, we asked ourselves, had Mr. Hitchman fallen into it? Johnson had really said, "Did we not hear so much said of Jack Wilkes, we should think more highly of his conversation." . . . But after hearing his name sounded from pole to pole as the phoenix of convivial felicity, we are disappointed in

his company." It was Mr. Forster, as we soon found out, who had first carelessly misquoted Boswell, and Mr. Hitchman, as can be established beyond a doubt, had fallen into the same blunder through borrowing from him. It so happens that in his essay on Churchill he again quotes the saying of "the great moralist," but he quotes him and Mr. Forster also at greater length. By placing the passages in parallel columns we shall be able to make clear to our readers the extent of his obligations to the author whom he has so ungraciously censured:—

MR. HITCHMAN.

"His name," said that great moralist, "has been sounded from pole to pole as the phoenix of convivial felicity." Lord Mansfield, who had little reason to love him, declared that "Mr. Wilkes was the pleasantest companion, the politest gentleman, and the best scholar he ever knew" (p. 3).

He conquered even the staid and prejudiced Johnson. "His name," says the latter, "has been sounded from pole to pole as the phoenix of convivial felicity"; adding, in less stilted but more happy phrase, "Jack has great variety of talk; Jack is a scholar, and Jack has the manners of a gentleman." . . . Thus qualified, and having constantly upon his lips the loudest professions of love for truth, right, and justice, it can be no matter for surprise that he should have fascinated Churchill. But beyond his personal qualifications, the sympathies of the poet were naturally dignified and honourable; he believed that the struggle in which Wilkes was engaged was one of right against might, of freedom against oppression, of the rights and liberties of Englishmen against Scottish and German tyrants (p. 116).

The reader will have noticed how Mr. Hitchman has expanded four words of Mr. Forster's. "More naturally, he added," has been swollen out into "adding, in less stilted but more happy phrase." Curiously enough, there was no addition at all; for, as any one would have seen who had taken the trouble to turn to Boswell, what was "more naturally said" came before and not after the "stilted phrase."

To show, however, the full extent of Mr. Hitchman's indebtedness to Mr. Forster we must venture to trouble our readers with parallel extracts of some length. Both authors are describing the sudden change which came over Churchill as soon as he became famous:—

MR. HITCHMAN.

From this time forward the manner of Churchill's life was changed. He threw off the sober garb of his clerical profession, and appeared about town, "dressed," says a contemporary writer, "in a blue coat with gold buttons, lace and ruffles." Pearce, Dean of Westminster, the "dull dean" of a later satire, offered a remonstrance on one or two occasions, but was met with indifference and even contempt. The parishioners of St. John's expostulated with more effect, and the poet resigned his cure in that parish. Quarrels and extravagances, equal on both sides, had long before separated him from his wife; but he now put an end to her complaints by settling a liberal allowance upon her. . . . "The stings and arrows of an avenging conscience" could not, however, be altogether turned aside. The autumn of the year whose spring had witnessed the publication of the "*Rocinard*," saw the author's third work, "*Night*." Here with a kind of railing sadness he disclaims any intention of braving the opinion of the world, but intimates his earnest desire of escaping from it. It is easy indeed to see how his soul, worn by conscience, loved any sorrow rather than its own, and sought relief in the consolations of friendship beneath the veil of that night which "heals or hides our care" (pp. 113-114).

MR. FORSTER.

He stripped off his clerical dress by way of parting with his last disguise, and appeared in a blue coat with metal buttons, a gold-laced waistcoat, a gold-laced hat and ruffles. Dean Zachary Pearce, afterwards Bishop of Rochester, remonstrated with him. He replied that he was not conscious of deserving censure. . . . The "dull dean's" third remonstrance as to dress met with the same fate; and it was not until the St. John's parishioners themselves took the matter in hand, a few months later, that Churchill resigned the lectureship of that parish. . . . The complainings of his wife were ended when his own poverty was ended, by the generous allowance he set aside for her support. . . . It was not possible with such a man as this, that any mad dissipation or indulgence, however countenanced by the uses of the time, could wear away his sense of its unworthiness, or entirely silence remorse and self-reproach. Nor is it clear that Churchill's heart was over half so much with the scenes of gaiety into which he is now said to have recklessly entered as with the friend by whose side he entered them. It is indeed mournfully confessed, in the opening of the epistle to that friend which was his third effort in poetry, that it was to heal or hide their care they frequently met; that not to defy, but to escape the world was too often their desire; and that the reason was at all times but too strong with each of them to seek in the other's society a refuge from himself.—*Mr. Forster's Essay on Churchill*, p. 240.

It would be easy to extend our parallels were there any need, but we have established our case, and we will take pity on our readers. We will now consider some of Mr. Hitchman's statements, without troubling ourselves whether they are borrowed

* *Eighteenth Century Studies. Essays.* By Francis Hitchman, Author of "The Public Life of the Earl of Beaconsfield," &c. London: Sampson Low & Co. 1881.

or his own. He sets up, as we have said, as a champion of John Wilkes. That great patriot is, it seems,

known to posterity rather by the satire of his caricaturist than by the record of his love for liberty, or the tradition of his fight against faction. . . . His very vices have been exaggerated. He has been accused of being unchaste, a drunkard, and a hunter after popularity. . . . Of his triumphs nothing has been said, chiefly because those who have written about him have regarded him from a standpoint of antagonism. . . . Of his real tenderness of heart numberless incidents are narrated. . . . He is, unfortunately with too good reason, suspected of occasional insincerity.

Among those who have thus done Wilkes injustice, his champion Mr. Hitchman unfortunately must be placed. By the time that he comes to write his "study" of Churchill, he has forgotten how good a man Wilkes was. There we read that he was a demagogue untroubled with scruples, and of a shallow and selfish nature; a man, moreover, who was a partaker in the vilest orgies of Medmenham Abbey. To apply to Mr. Hitchman his own words, "At the best this is ungrateful. We enjoy the fruit of his labours, and vituperate the man who planted the tree." However ill we judge of Wilkes—and very ill, indeed, we do judge—we scarcely need go beyond Mr. Hitchman for proper words of condemnation. We are content with saying that Wilkes was a demagogue of a shallow and selfish nature, untroubled with scruples, and given to indulge in the vilest orgies. It is, however, absurd to maintain that Wilkes's character is not understood. He rendered great and lasting services to his country, for which he does not deserve one farthing's worth of gratitude. We venture to say that, so far from his being underestimated at the present day, he is very much overestimated. That pleasant manner, and that wit which overcame Johnson and Mansfield, have overcome those who are in even a slight degree acquainted with the literature of the last century. The famous dinner at the house of the Messrs. Dilly in the Poultry has done more to whitewash his memory than a host of apologists could have effected, even if they had been headed by Mr. Froude and had had Mr. Hitchman to bring up their rear. The struggles in which he was engaged against the encroaching power both of the Crown and the House of Parliament are told in every History of England, though, for all we know, they have only lately reached the ears of Mr. Hitchman. It is, however, sometimes forgotten that beneath a pleasant manner lurked the meanest and most selfish heart, and that the patriot at any moment was ready to strip off his mask and become the placeman. But a few short months after he had fought the battle of general warrants, while he was an outlaw in France, he wrote to solicit the post of Ambassador to Constantinople. "If," he said, "Government means peace or friendship with me . . . I then breathe no longer hostility. And between ourselves, if they would send me Ambassador to Constantinople, it is all I should wish. . . . If I stay at Paris, I will not be forgot in England; for I will feed the papers, from time to time, with gall and vinegar against the Administration."

To prove Wilkes's real tenderness of heart Mr. Hitchman tells us that when his gardener wanted to shoot the blackbirds which ate his cherries, he said, "Poor birds! they are welcome." He does not tell us—perhaps he does not know—how cruelly he deceived his two daughters. He lived to the last in grand style, keeping up no less than three houses. He had, shortly before his death, assured his children that they would find a considerable balance at his banker's. He drew up a very proper will by which he made not only a suitable provision for them, but left legacies to other deserving people. Unfortunately it was found that his property did not amount "to one-fifth part of the few moderate legacies which he bequeathed." The friend who broke to his daughters the melancholy news of the state in which they were left, wrote "how irreconcilable to the language which he expressed not long before his death—both to the excellent Miss Wilkes, to Mrs. Arnold, and to Miss Harriet." Wilkes was beyond doubt an utterly worthless man, whose interest it more than once served to fight on the side of liberty. He was, however, a mercenary soldier who would at any time have deserted his colours and gone over to the other side, had it been made worth his while.

We must pass on to one or two other matters in Mr. Hitchman's book. In writing of the time at which Wilkes entered public life, he says, "the race of giants had, indeed, died out, and in its stead a brood of pigmies had come in." Among the pigmies was, however, the "great Commoner," under whom England entered on her long roll of conquests in the very year in which Wilkes entered Parliament. But we cannot look for much knowledge of those times in an author who, in writing of the reign of George II., speaks of the Liberal party, who describes a journal as being under "the editorial care" of Arthur Murphy, and who joining Smollett with Mallet calls them "these worthies." In a quotation from the *North Briton* he makes Wilkes say that the King of Russia (*sic*) dictated as conqueror every article of the terms of peace. This is a trifling error compared with the wonderful statement, on which we happened to light in a later essay, that it was Louis XVIII. who was the unfortunate sovereign who was murdered in the French Revolution. Compared with such errors as these, what does it matter that our author says that, "for the purpose of reporting for the *Gentleman's Magazine*, Johnson sat for so many nights in the Strangers' Gallery of the House?" We are not aware that Johnson was ever present, even one single night. How he composed his debates is so well known that it is not worth while, for the sake of showing Mr. Hitchman his blunder, to stop to explain. He quotes on this subject a long note from Mr.

Croker, as if Mr. Croker's *Bonwell* were some rare book. Had he quoted it, as he might very properly have done, to show that Mr. Croker blundered, he would have been more than justified. But he knows no more of the subject than any chance reader. In describing how the *Rosinard* drove Davies off the stage and into the trade of a bookseller, he says, "it was in his shop that Johnson afterwards beat Miller, the publisher of his Dictionary." We wish that he had given us his authority for this statement. Millar, not Miller, was called by Johnson "the Mæcenas of the age." "I respect Millar," he said, on another occasion; "he has raised the price of literature." It is scarcely likely that he first beat Mæcenas and then praised him. He certainly did beat Osborne the bookseller, but not in any shop. Mr. Hitchman quotes Wilkes's inscription to Churchill, and by his punctuation, as will be seen, turns the Latin into nonsense. "Carolo Churchill, amico jucundo, poetæ acri, civi optimo, de patriâ merito, p. Johannes Wilkes, 1765." Can it be that he mistakes *optimus* for an adjective that is in agreement with *civi*? In writing of Miss Wilkes he says, "She is described as having been a woman of remarkable abilities and of the highest attainments. The esteem in which she was held by her father, her own letters, and the universal testimony of her friends, bear out this character to the fullest extent." We would fain believe, for the sake of Mr. Hitchman's understanding, that he has not read a single one of her letters. He is merely repeating, with a slight change of words, the statement of a book-maker, who, had he compiled now, would be a disgrace even to this age. We know no more miserable production than Almon's *Life and Correspondence of Wilkes*. That worthless compiler, by printing all the trash on which he could lay hands that in any way was connected with his hero, managed to make five volumes when he had scarcely materials enough for one. Among other papers, he printed Miss Wilkes's letters to her "Ever-dear Papa." The following passage, which we take at random, is a fair specimen of these productions:—"I am happy to find that your health has not suffered, as I feared it might, by such inauspicious weather; and I flatter myself the accounts will be more favourable in every succeeding letter; but I cannot divest myself of considerable anxiety. I had the favour of yours of Sunday on the following day; a regularity I heartily wish may continue. I am glad you have plenty of strawberries, and that Trusty is a constant attendant, as becomes his species and his name." It is letters such as this that, according to Mr. Hitchman, bear out to the fullest extent the writer's character as a woman of remarkable abilities and of the highest attainments. We read—or, at all events, tried to read—these letters some years ago. Let him try to read them now. It is out of them he can find half-a-dozen lines that bear out his statement, we will gladly own that he has, by his studies, done something to increase the knowledge that the world already possessed of the eighteenth century.

AMAT.*

THOSE who might imagine from the title of this novel that it contained a simple love tale unmarked by incidents, would be disappointed. Amat is an imaginary Scotch peer, who has a baronial mansion in the north of Scotland, with lochs, grouse moors, deer forests, faithful henchmen, and devoted foster-brothers. The commonest acquaintance with the peerage and with the practice of novelists who cast about for suitable names would justify us in identifying Lord Amat with the owner of a Highland castle in Inverness-shire, and the head of a well-known Highland family that figured in the '45. But Lord Amat is by no means the hero or principal character in the tale. The story commences with a trip to the North, undertaken by four young fellows, "whose quiet gentlemanly air and manly bearing stamps them as soldiers of the best type." These are Charlie Grant, the "Master" of Amat, Ian Macdonald, Fergus Cameron, and Ronald Elliot; and they belong to the Red Highlanders, which we take to be the author's "transliteration" of the Black Watch. They have a month's leave, and are determined to make the most of it. The female and other elements in a story which otherwise would at once sink to the level of an article in a sporting magazine are provided by Mrs. Beauchamp, her husband the General, and her daughter Clarice; Colonel Trevor and Eila his daughter; and Lady Alice Campbell, a professional match-maker, and her daughters Olive and Julia. The plot is simple enough. Every young man chooses, or appears to choose, a partner. The young Master of Amat falls in love with Clarice Beauchamp; Ronald Elliot is paired with Eila Trevor, Fergus with Olive, and Julia with Ian Macdonald. The enjoyment of a large party in the Islands—slightly spoilt at first by the mishap of Charlie Grant, who falls overboard in a yachting excursion to be rescued by a clansman—is marred and abruptly ended by the alarming illness of Lady Amat and by the departure of the four officers summoned to take part in the suppression of the Indian Mutiny. In Bengal, when they get there, they go through the usual adventures, and are present at the taking of Lucknow under "Sir Colin," attacks on mud forts in Oudh, encounters with infuriated Ghazees, and operations in the Terai against the adherents of the Nana. In the course of these exciting episodes Ian Macdonald is shot while gallantly defending a post against overwhelming odds; Charlie Grant is severely cut about and nearly

* *Amat*. A Novel. 3 vols. London: Chapman & Hall (Limited). 1881.

dies of fever; Fergus Cameron loses one arm, crushed by the jaws of a wounded tiger; and Ronald Elliot gains the Victoria Cross, and barely escapes with his life. These stirring scenes are obviously insufficient to create the requisite uncertainty and suspense. It is absolutely necessary to introduce a villain into the tale; and the individual selected for this object is a certain unscrupulous and handsome Colonel Archibald Campbell, who, while Charlie Grant is exposed to rebels and a hot sun, makes love to Clarice Beauchamp in an English country house, and, as Byron said of Scott's Marmion, turns out to be not quite a felon yet but half a knight. This good-looking and dissolute Colonel makes up to Clarice Beauchamp, poisons her mind, and resorts to the incredible meanness of intercepting her Indian letters to the young Master of Amat. This is partly effected by the aid of a certain Adele, a daughter of a French officer who received his death wound at the Malakoff. This unfortunate girl, who, as we are pretty plainly told, has been ruined by the good-for-nothing Archie, finds herself an inmate of his mother Lady Alice's family, and lends herself to the interception of the letters. The result of this on Charlie Grant's happiness and fidelity may be easily conceived. Hearing nothing from his betrothed, and yet anxiously awaiting the English mails, his suspicions and jealousies are excited by dark hints and fragmentary information extracted from the correspondence of his friends; and just at this moment he is tenderly nursed by a "Cousin Amy," whose husband, Colonel Gardenne, had perished when shut up in Lucknow. Ancient connexion, indignation at the silence of Clarice, and perilous proximity to a pretty and attractive widow lead, as might be expected, to something very like an engagement; and we had some doubt whether Clarice Beauchamp was doomed to die a premature death or to become the hapless prey of the villain Archie Campbell. But it is Amy and not Clarice, whom the novelist selects for destruction. The *Kandy*, a fine P. and O. steamer, in which Charlie and Amy have embarked for England, is wrecked on the Laccadives; and the shipwreck and shock have such an effect upon the poor widow that she disappears out of the porthole of a small steamer which had taken off the passengers of the *Kandy* from the coral-reef and the cocoa-nut groves of Minicoy, or whatever island may have been intended. Charlie's way to reconciliation with Clarice is further simplified by the repentance of poor Adele, who is dying of consumption in Paris, and who has just enough of life and conscience left to enlighten Charlie Grant on the subject of the missing letters. After her death, Colonel Campbell, who fifty years ago must inevitably have been shot by a friend of the Amat family or else run through the body by some French chasseur or relative of Adele, sells out of the army, joins the Church of Rome, and, as Macaulay said of an old English dramatist, is converted from a good-for-nothing Protestant into a good-for-nothing Roman Catholic. It is almost needless to add that the Master of Amat is married to the appeased and careworn Clarice, and that Eila Trevor is united to the bronzed and black-bearded Ronald Elliot. Julia and Olive Campbell, as befitting the sisters of a camp and the daughters of a worldly and match-making woman, get no husbands at all, but betake themselves to the Black Forest, where one or other of them may possibly be comforted by the reappearance of an Austrian *attaché* with blue eyes, who is dimly alluded to in one of the opening chapters.

In this novel, of which the above is a correct epitome, there is nothing absolutely incredible, inconsistent with life in a country house or in an Indian cantonment, or even unprecedentedly sensational. Doubtless the author has seen active service in the Orises, Oudh, Rohilkund, and elsewhere; he probably can catch a salmon, shoot grouse in a windy drive on one *Ben* something, stalk a noble stag on another, and play his part in a social gathering at country houses. But all this does not make him a novelist, nor must he delude himself into the idea that he can gauge or portray character. Indeed, his young men and women are absolutely colourless. With the exception of the arch villain of the story, and a certain Mr. Fletcher, humorously called "the Weasel" by his intimates, there is not in any one the smallest shade of distinction. There is scarcely any one speech which might not suit Eila Trevor as well as Clarice, nor a sentiment which Ronald could not exchange with Charlie, without the reader detecting it. The girls are dark-eyed and darkly handsome; their laughter has a gentle ripple; their faces flush vehemently and then grow deadly pale; and they weep, bluish, throw themselves into each other's arms, and display wavy hair, queenly heads, flashing eyes, Grecian costumes, and matchless symmetry of form in the most correct style. Similarly, the young officers are invariably brave, stalwart, high-born, and high-bred; they enjoy life, and welcome a rough campaign as a pleasant distraction from monotonous enjoyment; suffer and die with something like heroism, and survive wounds and fevers by dint of sheer pluck. But there is no one individual trait in their conversation and characters which the reader could carry away, or which might not be put equally well into the mouths of a dozen similar lay figures. Then they interlard their speeches distressingly with bits of foreign languages—French, German, and Italian; and had not their sojourn in India been a mere episode, we might have been deluged besides with questionable Hindustani and Persian. Ach Himmel, madre mia, bellissima, per example, cela dépend, presto, mon cœur, chéri, coûte que coûte, and other tags, suggest that the author has lately attended some competitive examination, and has stolen a few of the scraps. *De absentis nō nisi bonum* would have produced unpleasant consequences in the days of Dr. Keate. To make a lady talk about polyandry—which is done twice—is scarcely

decent and is not at all suited to the stamp of *Vere de Vere*. Almost always, too, in the various love scenes and other exciting passages the men have decidedly the best of it. The girls, poor things, even when they do not blurt out their loves plainly, are at no pains to disguise them, and are too ready to throw the handkerchief.

If incidents could atone for want of insight into character, or inability to invest each separate red coat and uniform, mantilla or cloak, with something like distinct individuality, there would be little cause of complaint. Perilous escapes and horrifying catastrophes abound even before we get up to mutineers and mud-forts, reckless Ghazees and first-rate *Shikari* elephants. Charlie Grant, as we have already intimated, no sooner arrives at his father's castle than he is swept off the deck of his yacht by the swinging of the boom. This only serves to show how old Hamish the clansman can do battle with the tide. Blankets and stone bottles are called into requisition, and a convenient steamer comes alongside with a doctor on board, who speedily brings back the half-drowned yachtsman to life. In a deer stalk Fergus Cameron makes such a wonderful shot with his rifle that a splendid old stag lying down in the heather, never even stirs a muscle after the ball strikes him. Clarice Beauchamp, in a run over what we take to be meant for the Essex ploughlands, as the account is crammed with Essex names, rolls into a ditch with her horse Alma. Either the name or the sex should have been changed, and we are left for several pages in agonizing suspense, while the sagacious animal is fed with sugar and coaxed, and Miss Beauchamp is gradually extricated from her perilous position, and a gun is sent for from a farmhouse to shoot the horse, but happily is not needed. A tiger hunt in the Terai is very fairly described, with its line of elephants and grass jungle and pools swarming with every kind of game, from snipe and jungle-fowl to the *sambur* and the tiger. One of these latter animals fastens on the head of a first-class elephant, which goes on its knees to shake off the assailant, but only manages to pitch the occupants of the howdah almost on to the tiger's back. It is in this struggle that Fergus loses an arm, and the comic boy of the party, nicknamed the "Weasel," has all the breath knocked out of his body by an expiring kick of the tiger, and lies for two or three days between life and death. The wreck of the *Kandy* on a sharp coral reef is doubtless borrowed from life; but we must remind the author that this sort of thing has been excellently dramatised by the late Mr. Tom Taylor in the play of the *Overland Route*, and that a certain Sir Octavius Coppingier returning home from high civil employ bears a suspicious likeness to one of the characters so happily represented a few years ago at the Haymarket. The run in Clayshire, too, suggests a comparison with the late Major Whyte-Melville and with a celebrated fox-hunt in one of Mr. Trollope's novels, and it is certainly not one to the disadvantage of those eminent writers. The introduction of Mrs. afterwards Lady, Coppingier is made the pretext for clearing up a needless piece of scandal affecting the wife of Sir Claude Elliot and the mother of Ronald. Sir Claude had disinherited this son from a mistaken belief in his first wife's infidelity, which, in some extraordinary way, was due to the mischievous action of Lady Coppingier, then Mrs. Fitzgerald. We can only say that towards the end of the third volume this lady's explanation about a spendthrift cousin who dies a pauper and an outcast in India, an ancient and faithful nurse, and a demand of somebody for money, leaves the original cause for jealousy almost in the mist and muddle where we first found it. Although in these and similar plots, a change of scene from the Highlands to the Crimea, to the Continent, or to Asia, is justified by the universal practice of novel-writers, we have rarely met so many abrupt transitions as in the second and third volumes. We are whisked away from Clayshire to the plains and hills of India, and back again to Town and the clubs in a manner which takes away the breath. We do not deny to the writer some amount of descriptive power; and we can certainly believe that he describes scenes which he has gone through as well as persons whom he has known. But a life alternating between active service and healthy enjoyment, between deer-stalking and facing Pandies and Russians, does not guarantee success in the field of fiction.

RHODES'S GEORGICS OF VIRGIL.*

OF late years Virgil's works have been comparatively neglected by translators. Indeed, so far as we are aware, the only translation of any importance which has appeared since the publication of Professor Conington's posthumous works is Mr. Wilkins's prose version of the *Georgics*; and this, excellent as it is from the point of view of scholarship, and as a help to students, is too rigidly concise and literal to be of much interest to general readers. It may be doubted whether it is possible to turn the *Georgics* into acceptable English verse unless by following the example of Dryden, and entirely sacrificing accuracy to elegance. We may gather that this was Conington's opinion, from the fact that not even the brilliant success of his verse translation of the *Æneid* could tempt him to extend the experiment to the *Georgics*. His prose version of these poems is rather a commentary than a translation. Literary charm is neglected in the attempt to bring out, by means which are often clumsy, the full force, not merely of Virgil's words, but

* *The Georgics of Virgil*, Translated into English Verse by James Rhodes, Assistant-Master at Sherborne School. London: C. Kegan Paul & Co. 1881.

of the order in which they are placed, a point often quite as important as the words themselves. Virgil, no doubt, gives more opportunities to the commentator than to the translator. Perhaps no poet—certainly no great poet—has ever trusted so much to expression and so little to the thing expressed; and hence it is that the charm of his writing is so liable to disappear in the transition from his own language to another. To express all his meaning is only possible by an amount of expansion which the slightness of the subject-matter will scarcely bear, and to express less than his meaning is to do him injustice greater still. When to this difficulty is added the uncongenial nature of the topics treated in the *Georgics*, which can only be rendered poetical by the exercise of consummate art, it is not to be wondered at that so many translators of the *Æneid* have left the *Georgics* untouched, and that, of those who have attempted the task, none have met with a full measure of success. Since the appearance of the "Loves of the Triangles" in the *Anti-Jacobin*, didactic poetry has not been held in much esteem in England; and it is perhaps only by the substitution of prose for verse that a Latin poem of the kind can be translated into English with the accuracy which modern criticism demands. But, from the point of view of very many readers, the preservation of the charm of metre is worth some slight sacrifice of exact scholarship, provided that the author's meaning be strictly kept in view. In a verse translation, too, it is possible to a greater extent than in prose to throw light, as it were, upon the subject by the use of words and expressions sanctioned by the English poets, which, though they may not express the author's meaning so exactly as a straightforward translation, have more power to bring it home to the reader, and to connect in his mind the writer of a bygone day and alien race with the literature and thought of his own country. The choice of each reader between the two styles of rendering will depend ultimately upon the question whether he is more in sympathy with the language and literature to which the original work belongs, or with that of the translation. While Latinists like Conington will be inclined to condemn anything which savours of extraneous ornament, the taste of persons of wider culture will incline to that version which is most truly English.

Mr. Rhoades's work is to be welcomed because, though it falls short of the highest excellence, and is marred by certain blemishes to which we shall presently call attention, it is an effort, and, on the whole, a successful effort, to combine close fidelity to the original with poetical form and expression. Mr. Rhoades is evidently well read in English poetry, and his blank verse, though sometimes harsh and wanting in variety, is at least less monotonous and better suited to the subject than the rhyming heroics which, from Dryden's day to the middle of the present century, were the recognized vehicle of translation. To test the translator's powers of graceful rendering one turns naturally to the episode of Orpheus and Eurydice at the end of the Fourth *Georgic*. Parts of the story are very well done. We may quote the description of the loss of Eurydice to show Mr. Rhoades at his best:—

And now with homeward footstep he had passed
All perils scatheless, and at length restored,
Eurydice to realms of upper air
Had well nigh won, behind him following—
So Proserpine had ruled it—when his heart
A sudden mad desire surprised and seized—
Meet fault to be forgiven, might Hell forgive.
For at the very threshold of the day,
Heedless, alas! and vanquished of resolve,
He stopped, turned, looked upon Eurydice
His own once more. But even with the look
Poured out was all his labour, broken the bond
Of that fell tyrant, and a crash was heard
Three times like thunder in the mires of hell.

It will be seen by comparison with the original that this is a very close rendering, and the graphic effect of the lines

Restitit, Eurydicenque suam, jam luce sub ipsa,
Immemor, heu! victusque animi respexit

is well preserved.

If all Mr. Rhoades's work were as good as this, there would be little but admiration to record. Unhappily, much that is otherwise praiseworthy is marred by affectations and tricks of style quite at variance with the simplicity and grace of the passage quoted above. The most irritating of these peculiarities is the constant use of alliteration. Mr. Rhoades's love for this device is not merely unpleasant in itself, but occasionally leads him into clumsy and even inaccurate translation. Thus he renders "soleni rapidum" by "the striding sun." Now the epithet "rapidus" as applied to the sun seems always to indicate consuming heat, not swift movement, and even if the latter meaning be the true one in the present instance, "striding" does not seem to be a very happy description of the sun's motion through the heavens. Again, the line

Tam multa in tectis crepitans salit horrida grando

is translated

So thick a hail
In spiky showers spins rattling on the roof.

"Rattling on the roof" is well enough, and reproduces excellently the suggestive sound of Virgil's line; but the effect is injured by the grotesqueness of the preceding words. "Incipiat sulco attritus splendescere vomer" is rendered "teach the furrow-burnished share to shine," and "Passim rivis currentia vina repressit" becomes "Curbed the random rivers running wine."

It will be readily allowed that any legitimate device for breaking the monotony of the narrative should be gladly welcomed in the

translation of a didactic poem, but the too frequent employment of one method goes far to increase the sameness which it is designed to avoid. Mr. Rhoades is particularly fond of the figure, familiar to schoolboys studying Latin verse composition, by which the thing spoken of is thrown into the second person and addressed by the poet. It should not be forgotten, however, that this figure is of far more common occurrence in Latin than in English poetry, and Mr. Rhoades's use of it is certainly excessive. We have "Oh, for you plains," "thy ridge, Vesuvius," and so forth; and near the opening of the Third *Georgic* we find "thy flood, Ocytus," "thy behest, Mæcenas," "thy hounds, Taygete," all within the space of ten lines. Nor is Mr. Rhoades always quite fortunate in the invention and use of compound words. "Undergliding," which occurs in the translation of the line

Fluminaque antiquos subterlabentia muros,

and "besport," are not, so far as we are aware, English words. "Wolf-kin" is an awkward rendering of "genus luporum."

The earlier portion of the Third *Georgic* is, on the whole, the least satisfactory part of the work. In the descriptions of the horse, his development, and his training, Virgil himself has been sufficiently daring in his use of language, and any attempt at a close imitation of his bold figures could scarcely meet with anything better than at least partial failure. Mr. Rhoades does not seem to be helped out of his difficulties by a knowledge of horsemanship, which is here really necessary to a successful translation. "Luxuriatque toris animosum pectus" is poorly rendered, "his sprightly breast exuberant with brawn." "Græsus glomerare superbos" is, we freely confess, difficult to translate, though the meaning is clear enough; the difficulty is certainly not solved by Mr. Rhoades's line:—

And heap the tossing footsteps of his pride.

In the equally difficult phrase "sinuatque alterna volumina crurum" the translator is not more fortunate. Here is his version:—

now learn to ply
The sinuous alternations of his legs.

This comes very near to being nonsense, but, at the same time, the attempt to imitate closely Virgil's most intricate expressions shows how much conscientious labour has been bestowed upon the work, and is preferable to the practice of shirking difficulties which is common among a large class of translators. Sometimes the desire to express the whole meaning of a phrase, or to give the full force of a tense, leads Mr. Rhoades to make too much of it. For instance, the line

Illius immensæ ruperunt horrea messes

is rendered

Ay, that's the land whose boundless harvest-crops
Burst, see! the barns.

The interjection in the second line is no doubt employed to mark the sense of suddenness given by the use of the perfect, but the device is not very graceful; and, after all, the perfect here may very well have merely an aorist signification.

There are one or two slips in the matter of English which might with advantage be corrected in a future edition. We are left in doubt who "they" may be in the following passage:—

Of groves which India bears,
Ocean's near neighbour, earth's remotest nook,
Where not an arrow can outsoar in flight
Their skyey tree-tops; yet no laggards they
When girded with the quiver.

Obviously it must be either the groves or the "skyey tree-tops" which are no laggards when girded with the quiver. The ambiguity is the more needless as Virgil makes it perfectly clear who are meant:—

Et gens illa quidem non sumptis tarda sagittis.

The Third *Georgic* gives an example of the same kind. Describing the rage of mares at certain seasons, Virgil writes:—

Diffugiunt non, Eure, tuos neque Solis ad ortus
In Boream Caurumque, aut unde nigerimus Auster
Nacitur.

Here, of course, "diffugiunt" is connected closely with "in Boream Caurumque," the intermediate words being parenthetical. Mr. Rhoades translates as follows:—

They scud,
Not towards thy rising, Eurus, or the Sun's,
Boreas, or Caurus, or black Auster's birth.

According to this account, they "scud" in no direction whatever, the whole horizon being closed against them. A careless mistake of a different kind is the translation of "pingues tilis" by "glue-bearing limes." As glue is exclusively an animal product, "gum-bearing" would be a more appropriate epithet.

Absolute mistranslations are rare indeed; in such an author as Virgil there are countless passages where commentators differ, and though in some instances we do not entirely agree with Mr. Rhoades's choice of interpretations, there is generally much to be said on both sides. In two cases, however, his version seems to be incorrect. In the advice given in the Third *Georgic* to cease using a horse when he has grown old and sluggish, the words "nec turpi ignosce senectæ" are translated "and spare his not inglorious age." One or two commentators have, probably upon mistaken grounds of humanity, adopted this rendering, but it seems almost impossible that it can be correct. Apart from the extreme difficulty of getting such a meaning out of the Latin, the sentiment is not one which was likely to occur to Virgil, or to any other Roman of his day. The true meaning seems to be, "Nor excuse his worth-

learned on the ground of age." In the reply of Proteus to Ariadne at the end of the Fourth Georgic the following passage occurs:—

Magna iula somnosa; tibi has miserabilis Orpheus
Haudquaquam ob meritum pœnas, ni fata resistant,
Suscipiat.

Mr. Rhoades translates:—

Nor light the debt thou payest; 'tis Orpheus' self,
Orpheus unhappy by no fault of his,
So fates prevent not, fans thy penal fires.

Surely the words "haudquaquam ob meritum" refer, not to "miserabilis Orpheus," but to "pœnas." The elliptical nature of the construction makes the passage a difficult one to translate, and we have never yet seen it quite satisfactorily done into English. The best, or at any rate the clearest, rendering with which we are acquainted is to be found in M. Desportes's prose translation of the Georgics, a work which has many great merits, though conciseness is not one of them:—"Tu expies un grand crime, et ta peine est légère en comparaison; si les destins l'eussent permis, Orphée t'en aurait fait éprouver de plus cruelles." This is perhaps rather an explanatory paraphrase than a translation, but it is difficult to see how the meaning could have been fully expressed in fewer words.

In spite of the defects to which we have called attention, Mr. Rhoades's translation is a valuable contribution to Virgilian literature. Its merits lie not so much in brilliantly happy renderings of isolated words and expressions, as in the careful and well-sustained endeavour to put the full meaning of the original into good poetical English. We have already said that equal closeness is seldom attained in a verse translation. Perhaps we may add that it is seldom even attempted, and thus inconsistencies of method seem sometimes to arise from the fact that the writer has not quite settled the canons of translation in his own mind. Where grace and accuracy are incompatible, he shows a hesitation which the prose translator on the one hand and the free versifier on the other would lightly avoid, and he inclines sometimes to this side, sometimes to that. Uncertainty proceeding from this source, though it may interfere now and then with the unity of the work, will not lessen its interest for students of the art of translation, who will value it both for what it suggests and for what it achieves. It is to be hoped that this may not be Mr. Rhoades's last effort of the kind, and that his next work may deal with a subject in which absolute success is not so entirely out of reach. Meanwhile he is to be congratulated on the way in which he has acquitted himself of one of the most ambitious undertakings in the whole range of classical translation.

THE LIBRARY.*

THERE is an ancient drama the title of which is known to all students of English literature, *If this be not a good Play, the Devil is in it*. If a book in which Mr. Lang talks at large about books and book-collecting, in which Mr. Loftie puts in an *entre-filet* about manuscripts and manuscript collecting, and in which Mr. Austin Dobson brings up the rear with a chapter on the illustrations of the last century, be not a good book, then some irregular interference with the ordinary course of things on the part of a malevolent power has but too obviously taken place. The malevolent power, however, has in this instance abstained or has been driven off. The severe critic who "collars" every book, and asks it "How do you answer to your title?" can alone hope to find any handle for derogatory treatment in this little volume. Very little of it is devoted to matter-of-fact instructions as to how to fit up a library or to more matter-of-fact book-making about the libraries *du temps jadis*. Mr. Lang does indeed praise Messrs. Triebner's revolving book-cases (in which we agree with him), and here recommends leather fringes to bookshelves, in which we are not so sure that we agree. That they hide more dust than they keep out is the verdict of some persons; and the free play given by their absence to the feather brush—if you can get your servants to use it, which in ninety-nine cases out of a hundred you cannot—more than compensates for such preventive checks as their presence supplies.

But the pages given to this sort of lore and to the mention of a mysterious library chair which would serve without reversing as a library step, and which was devised by the late Sir W. Stirling Maxwell, are but occasional condescensions on the part of Mr. Lang. The burden of his song is (to alter Eustache Deschamps and Grippeminaud slightly) "Ça! des bouquins. Ça! des bouquins." His chapters make up an enthusiastic and eloquent defence of the bibliophile, the person who has been unkindly defined as he who loves a book for reasons which do not make it literature. It would be impossible to present the case of this notorious character with greater art, with a more lavish profusion of anecdote, with a skilfuler change of ground to new and ever new points of vantage, than Mr. Lang does. He declines to rest, as do many timid bibliophiles, on the ground (generally safe, but sometimes treacherous) that old books are much nicer as books than new. He is too cunning for that, and he knows how to avoid the attack of the cunning modern who asks why he is to

prefer an eye-blinding and somewhat grubby *elzevir* to one of M. Lemerre's virgin beauties, on Whatman or papier de Hollande, with ample margin and fair type. The insidious hater of book-loving youth who pretends "to encourage the art of his century" (we have known this pretentious phrase used by the culprit in question) will find Mr. Lang too slippery for him. He admits the excellence of these modern things, but his heart evidently turns to the things that are ancient. *Elzevirs* seem to be Mr. Lang's own special weakness, though there is a fine catholicity about him which contrasts nobly with the particularism of some of his brother book-maniacs. He can take an interest in a book because it has the inscription Léon Gambetta, 1844, especially if it happens to be a work of devotion. He indicates a variety of book sport, which, though dangerous, we can avouch from experience to be full of excitement, and which must fill the genuine book lover with vindictive satisfaction, though it is to be feared that his blood would rarely be cool enough to carry out the plot. You go to a sale-room, and if (as is too frequently the case) you find it to be a mere knock-out of dingy dealers who combine to run up any outsider, you encourage the pack up to the fair value of the book, and then stealthily desist from bidding, leaving the bidders to be bit. This, we repeat, can be done, but the sportsman must have himself well in hand. We should imagine that Mr. Lang was something of a *cœur volage* in respect of books, and indeed we are not sure that bibliophilism does not encourage this evil propensity. "As a man's tastes develop," he says, "his books put on a different aspect. He hardly knows the *Poems and Ballads* he used to declaim, and cannot recover the enigmatic charm of Sordello. Books change, like ourselves, like friends, like everything." Now we confess that we should say this is exactly what books do not do. "Fate is a sea without shore, but the book is a rock that abides," unless the book lover has, as we have suggested, pinned his faith to a passing charm either of rarity or bibliographic peculiarity. However, this is a point on which we may agree to differ with Mr. Lang. We can here give no idea of the wealth of anecdote on book collectors, bookbinders, book lovers, book stealers, which he has accumulated. Some pages about the "biblioklept" will not be new to diligent readers of the *Saturday Review*, but they will find them connected with much novel and pleasing matter. The unfortunate Spaniard who committed a foul murder, completed by arson, for the sake of a book which he discovered after all not to be unique; the eccentric Pixérécourt, about whom as many legends cluster as about Talleyrand or the Prince de Ligne, figure in Mr. Lang's gallery. He has a passage, dangerous but adroit, as to the opposition—a feminine opposition—which the book collector most frequently has to encounter, and as to which we must requote from him a delightful triplet of Mme. Fertiault's:—

Le livre a ton esprit...tant mieux !
Moi, j'ai ton cœur, et sans partage.
Puis-je désirer davantage ?
Le livre a ton esprit...tant mieux !
Heureuse de te voir joyeux,
Je t'en voudrais...tout un étage.
Le livre a ton esprit...tant mieux !
Moi, j'ai ton cœur, et sans partage.

Unfortunately they do desire "davantage," and are by no means satisfied to see their partners "joyeux." But this is tender ground.

Agreeably with the plan of his book, which is, as has been said, really a book about "des vieux boucs" (as we once heard M. Victor Hugo macaronically observe to a bookstall-keeper, to whose presumed ignorance of French he wished to condescend), Mr. Lang seldom diverges into actual literary criticism. There is, however, a charming passage about the *Hypnerotomachia*, a book which for widely different reasons unites an earnest band of admirers:—

Among old illustrated books, the most famous, and one of the rarest, is the "Hypnerotomachia Poliphili," "wherein all human matters are proved to be no more than a dream." This is an allegorical romance, published in 1499, for Francesco Colonna, by Aldus Manutius. *Poliam Frater Franciscus Columna peramavit*. "Brother Francesco Colonna dearly loved Polla," is the inscription and device of this romance. Poor Francesco, of the order of preachers, disguised in this strange work his passion for a lady of uncertain name. Here is a translation of the passage in which the lady describes the beginning of his affection. "I was standing, as is the manner of women young and fair, at the window, or rather on the balcony, of my palace. My yellow hair, the charm of maidens, was floating round my shining shoulders. My locks were steeped in unguents that made them glitter like threads of gold, and they were slowly drying in the rays of the burning sun. A handmaid, happy in her task, was drawing a comb through my tresses, and surely these of Andromeda seemed not more lovely to Perseus, nor to Lucius the locks of Photis. On a sudden, Poliphilus beheld me, and could not withdraw from me his glances of fire, and even in that moment a ray of the sun of love was kindled in his heart."

The fragment is itself a picture from the world of the Renaissance. We watch the blonde, learned lady, dreaming of Perseus, and Lucius, Greek lovers of old time, while the sun gilds her yellow hair, and the young monk, passing below, sees and loves, and "falls into the deep waters of desire." The lover is no less learned than the lady, and there is a great deal of amorous archaeology in his account of his voyage to Cythera. As to the designs in wood, quaint in their vigorous effort to be classical, they have been attributed to Mantegna, to Bellini, and other artists. Jean Cousin is said to have executed the imitations, in the Paris editions of 1546, 1556, and 1561.

The "Hypnerotomachia" seems to deserve notice, because it is the very type of the books that are dear to collectors, as distinct from the books that, in any shape, are for ever valuable to the world. A cheap Tauchnitz copy of the *Iliad* and *Odyssey*, or a Globe Shakespeare, are, from the point of view of literature, worth a wilderness of "Hypnerotomachia." But a clean copy of the "Hypnerotomachia," especially on vellum, is one of the jewels of bibliography. It has all the right qualities; it is very rare, it is very beautiful as a work of art, it is curious and even bizarre, it is the record of a strange time, and a strange passion; it is a relic, lastly, of its printer, the great and good Aldus Manutius.

* *The Library*. By A. Lang. With a Chapter on Modern Illustrated English Books by Austin Dobson. "Art at Home" Series. London: Macmillan & Co. 1881.

We could break a lance with Mr. Lang about the Tauchnitz *Iliad*; but no matter. The truth about *The Library* is that it is not so much one to be reviewed as one to be read. It is a little desultory, and the desultoriness is clearly designed. But no one who, whether as a book lover of the kind who would prefer the *Hyperotomachia* to the Tauchnitz *Iliad*; or a book-lover of the kind—very shocking, we suspect, to Mr. Lang—who would like a Lemerre reprint on Dutch paper of the *Hyperotomachia* better than the genuine Aldus; or as a merely curious person who likes to read pleasant things admirably written, takes up the volume, is likely soon to put it down. On book-worms, how they “carol like very chanticleer”—an awful experience; on Mme. du Barry, who—it was just like her gracious, if graceless, and childlike, if very uninnocent, ways—bought up several thousand casual volumes in rose-coloured leather to prove that she was a “fittory woman”; on a hundred other things and persons Mr. Lang has a very pleasant say to say. His illustrations, too, are not to be disregarded. There is a pleasing frontispiece by Mr. Walter Crane, depicting a youth mounting library steps at the bidding of a mediæval sage, who sits in a most admirable chair, resembling those in which the porters of our colleges and our great houses await the strayed reveller. Then there is a reproduction in chromolithograph of a binding which we do not greatly admire; and, lastly, there is the charming title-page, dear to all lovers of French literature, of Gaiot du Pré's *Roman de la rose*, where the lover, all difficulties over and all obstacles removed, is at last in a position to say, as he does in the original:—

Ainsine de la rose vermillon.

Mr. Loftie, in dealing with the collection of manuscripts (as he does in a few workmanlike pages), has to confess that the ordinary amateur can hope for little that can be called literature, and must content himself with Bibles, Psalters, Missals, Books of Hours, or service books of one kind or another. The hints given, however, for collation and identification of period are very clear and sound. Mr. Dobson has a wider subject, and has made the most of it in his space. In something more than fifty pages he has reviewed the whole history of English book illustration for the last hundred and fifty years, giving account of the characteristics of each master's work, and now and then some excellent criticism. The remarks on Blake, on Bewick, and on Thackeray, as well as those on the chief illustrated journals of the present day, are thoroughly sound and admirably expressed. This part of the book, moreover, has the advantage of lavish illustration, from old plates and blocks of course for the most part, but none the less welcome for that. Here the reader may make or renew acquaintance with Mr. Tenniel's adorable “Black Kitten” from *Through the Looking-glass*, with the fine production from an American magazine of Blake's solemn illustration of recumbent figures for Blair's *Grave*, with Mr. Rossetti's “Sleeping Sisters” from *Goblin Market*, and with many other old favourites, besides some comparatively new ones of Miss Greenaway's and Mr. Caldecott's. A more delightful book of the kind it would be difficult to imagine, impossible to find.

ARABIAN PILGRIMAGES.*

There is something so fascinating about the idea of desert life with its perfect reversion to the circumstances and surroundings of Patriarchal times, that books of Arabian travel are always certain to meet with a good reception. When, as is the case with Lady Anne Blunt's *Pilgrimage to Nejd*, they are full of fresh information imparted without pedantry, and of stirring adventure told with good taste, the critic's task becomes a pleasant one, for there is nothing but good to say about them. The author is already known by the charming account she has given of previous travels on the Euphrates and through Mesopotamia and the Syrian desert, of which the journey to Nejd forms the natural complement. Nejd, or the Highlands, is the very centre of Bedouin life, the scene of the exploits of their ancient heroes, and is to the Arab, from a national point of view, what the Hijaz is to the Mohammedan from a religious standpoint. It is also the birthplace and the chief stronghold of that Wahabi power which, at one time, threatened to revolutionize the whole Moslem world, and actually constitutes a formidable source of danger not only to the Ottoman Government, but even to our own rule in India. The political situation in Arabia before the establishment of the Wahabi kingdom at the beginning of last century is thus explained in the editor's preface, and will serve to correct many erroneous notions that are prevalent on the subject:—

All Arabia was independent of central authority, each tribe, and, to a certain extent, each town, maintaining its separate existence as a State. Religion, except in its primitive Bedouin form, had disappeared from the inland districts, and only the Hijaz and Yemen were more than nominally Mohammedan. The Bedouin element was then supreme. Each town and village in Arabia was considered the property of one or other of the nomad Sheikhs in the neighbourhood, and paid him tribute in return for his protection. The Sheikh, too, not unfrequently possessed a house or castle within the city walls, as his summer residence, besides his tent outside. He in such cases became more than a mere suzerain, and exercised active authority over the townspeople, administering justice at the gate daily, enrolling young men as his body-guard, even on occasion levying taxes.

He then received the title of Emir or Prince. It was in no other way, perhaps, that the “Shepherd Kings” of Egypt acquired their position and exercised their power; and vestiges of the old system may still be found in many parts of Arabia.

Amongst the chieftains whom the new state of things drove out of the country was one Ibn Arûk, who settled at Palmyra, and with whose lineal descendant Mohammed our travellers made acquaintance. This young man, though boasting of high Arab descent on his father's side, was of less pure origin by the mother's, and the proud Anazeh tribe who lord it over Tadmor would not give him their daughters in marriage. This was a source of great grief to him, and his dearest wish was to seek a wife among his kinsmen in Nejd, and so wipe out the stain upon his pedigree. Mr. Blunt proposed to him to accompany himself and his wife on their journey to the country, and went through the preliminary ceremony of adopting the young Bedouin as his “brother,” an alliance offensive and defensive of the most inviolable character, and the party started out upon their romantic and adventurous journey. Mr. Palgrave's book on Central Arabia has made the town life of that country sufficiently well known; but little had been written of the great desert of the Nejd, which must be crossed to reach it, or of the nomades who inhabit it. Of these Lady Anne Blunt has given a lifelike and picturesque account. Travelling under the peculiar circumstances to which we have referred, and adopting Arab dress and habits, they naturally enjoyed greater advantages in this respect than would fall to the lot of ordinary persons; and the account before us is a valuable contribution to geographical knowledge, as well as a most entertaining book.

The first few pages introduce us to some interesting characters, and contain personal reminiscences of Mijuel, the Anazeh Sheikh, and his English wife, and of that Bayard of Islam, the celebrated Abd el Kader, to whose noble character the writer does ample, but merited, justice. A not very complimentary sketch is also given of Midhat Pasha, whose claims to pose as a reformer are declared to be totally unfounded. A characteristic incident occurred at starting; a cry of thieves was raised in the night, and the proprietor of the garden where they were encamped, with much noise and scuffling, brought in a prisoner whom he had captured, according to his own account, after a terrible resistance. Believing the whole scene to be merely got up with a view to *bukhalish*, they declined to take any notice of it, and “the two men good-humouredly let the matter drop.” Such comedies are by no means of rare occurrence in the Desert, and one which occurred in the experience of the writer of this notice may not be out of place here. Two Bedouin Sheikhs, after a long verbal contest, drew their swords and rushed upon each other with fearful threats of mutual extermination; their friends rushed to the rescue, and at once responded to the “hold me back some of you who know my temper” looks of the would-be combatants. The traveller insisted on the others retiring and allowing the Sheikhs to fight the matter out; but no sooner did these doughty champions find themselves alone than they relapsed into a broad grin and quietly put up their weapons.

We have not space to follow Lady Anne Blunt through the whole of her wanderings, and can only single out a few of the more exciting or interesting passages. The perils inseparable from such a journey were very real, and the travellers were more than once in danger of their lives. On one occasion they were surprised by a *ghazu* or raid. A troop of horsemen swopt down upon them, charging them full with their lances; the lady was knocked down by a spear and her husband had a narrow escape for his life. The horses were confiscated, and the party were taken prisoners and carried to the caravan. There the tables were turned, for the attacking party proved to be kinsmen of their guide and companion Mohammed, and, of course, further hostilities were out of the question. They were exceedingly vexed, and naïvely expressed their annoyance at having to give up their prey, especially “the beautiful mares and the beautiful gun”; but Arab good-humour prevailed, and conquerors and conquered parted good friends. At Jéf Mohammed found his long lost relatives and a bride elect; the account of the negotiations for the dower, or rather purchase, of the young lady is very graphic and amusing. In the Nejd they found “a cairn with the remains of some old letters scratched on the stones, of the same kind as those to be seen on Sinai, or rather in the Wady Mokatteb.” It is to be regretted that fuller and more accurate copies of these are not given, as specimens of Nabathean writing are by no means common, widely as the language was spread over Arabia in the first centuries of the Christian era.

The respect for human life, which the rigorous prosecution of the blood feud instils into the Arab mind, has been disregarded by the ruler of Hail, the capital of Nejd, who put to death his relatives with a thoroughness that would have done credit to a Central Asian despot. It was therefore by no means a safe thing to venture into the city, especially as Lady Anne Blunt and her husband, through wearing Arab costume, did not conceal their nationality, and Wahabi fanaticism could hardly be expected to look with favour upon Ferinjee infidels. The Emir, however, received them very graciously, and they stayed long enough to be able to give some very interesting information about the town. From Hail they made their way northward by Medhat Ali to Bagdad, and brought their pilgrimage to Nejd to an end. The remainder of the book is occupied with an account of a journey from Bagdad to Bushire, which is less interesting than the Arabian experiences, and is a record of discomfort, disappoint-

* *A Pilgrimage to Nejd*. By Lady Anne Blunt. London: John Murray.

Six Months in Meccah. By T. F. Keane. London: Tinsley Brothers.

ments, and misfortunes which somewhat mars the pleasant effect produced by the former pages. The reason given by the author, or rather by the editor, for its insertion is

that it serves as an additional proof, if such be wanting, of the folly of those schemes which, under the name of the "Euphrates Valley" and "Indo-Mediterranean" railway companies have from time to time been dangled before the eyes of speculators. A country more absolutely unsuited for railway enterprise than that between the Mediterranean and the Persian Gulf has probably never been selected for such operations ; and if, continues the writer,

the recital of our passage through the uninhabited tracts, which form nine-tenths of the whole region, shall deter my countrymen from embarking their capital in an enterprise financially absurd, I feel that its publication will not have been in vain.

The account of a pilgrimage to, and six months' residence in, Mecca by Mr. T. F. Keane is a work of entirely different character, but not the less interesting for all that. It reads, in fact, rather like one of those stories of astounding adventure which boys delight in, and which are chiefly to be found in the pages of juvenile magazines, and yet it seems to be true. During the pilgrim season 1877-1878 the author, apparently a light-hearted young sailor, found himself at Jeddah, and conceived the audacious idea of making a pilgrimage to the holy shrine. Unlike his great predecessors, Burckhardt and Captain Richard Burton, he did not prepare himself for the task by long study and experience of Eastern tongues and manners; still less did he take the preliminary precautions adopted by another Hajj, Herman Bicknell, the translator of Hafiz, who qualified as a Moslem at Cairo before setting out for Mecca. On the contrary, so slight was his acquaintance with Oriental languages that he seems at first to have adopted the name of "Abdur Mohammed," a title that is not only impossible, grammatically and philologically, but offensive to Moslem ears. A kind hint from a travelling companion, a young Indian nobleman to whose suite he attached himself, induced him to exchange his preposterous appellation for the more reasonable one of Mohammed Amin. In the motley crowd of pilgrims of all colours and nationalities, neither his appearance nor language attracted particular attention; and, by conforming to the gregariously performed religious ceremonies of the pilgrims, he generally escaped unpleasant observation. We say generally, because on one occasion at least he was in imminent danger of detection; and had that fortune which proverbially favours the bold to thank for his escape rather than any prudence of his own. The incident is so characteristic that we prefer to tell it in the author's own words:—

One day I was passing a large college on the outskirts of the town when the students of all ages, from five to fifteen, were out playing. . . . I was much amused watching them, when a little Hindi child near me shouted, "O, look at the Christian!" . . . Up to this nothing of the kind had happened to me, and, as it was unexpected, it took me very much aback. It also collected all the young imps in the neighbourhood, who took up the cry; and one great hulking brute stepped up to me and said in a blustering manner, "Christian dog, if you are a Mohammedan, make the profession of your faith." Now I am one of the most peaceably disposed of men—as "Jack" says, "I would rather run a mile than fight a minute"—yet all my life I have been getting dragged into fights. I suppose I must look like a fellow easily put upon, whereas I have a Bedawi aversion to dirt as an article of diet. This beggar riled me, and I did not feel at all disposed to give an account of myself to him. No, I just took the fellow by the shoulders, turned him round, and administered a kick in the rear that must have made him see stars. Now I do suppose I could not have perpetrated a more un-Mohammedan act. . . . It brought forth a yell of "Ya! Christian" from its recipient which was taken up by the whole crew. I had put my foot in it, had been taken off my guard, and now saw things could not be mended, so turned round and attempted to make a dignified retreat, when—whirr! close past my ear flew a blue object (a pigeon, I thought), and it lit a few feet ahead with a clatter that showed the kind of blue rock it was, and another followed, fetching me one on the skull that would have "settled the number of my mess" but for the thickness of my too-attractive head-dress.

He narrowly escaped being stoned to death; but by seizing an Arab child and holding it in his arms as a shield he succeeded in getting off without serious damage, and kept himself in seclusion for three weeks until the affair blew over. His exuberance of spirits would probably have made him sally forth prematurely from the house had he not taken the precaution of putting himself under opium all the time, and so acquiring another novel experience. The descriptions of Mecca itself, the holy shrine of the Kaabah and its precincts, and of the people the author came across during his sojourn, are very graphic, though given without the least attempt at literary embellishment. El Hajj Mohammed Amin has a great deal to say upon the subject of the slave-trade, and seems to think that English interference in the matter does little but raise the price of the article. With this view we differ very emphatically, though we must confess that no reliance whatever is to be placed upon any pretended co-operation of the Oriental authorities. A story is related, told to the author by one of the principal actors, of a craft with two negro slaves, perfectly happy and contented, on board, which was evidently about to be boarded by an English cruiser bearing down upon them. The crew promptly killed the negroes and threw them overboard. Mr. Keane's informant "regretted the necessity which compelled them to this mainly because they were both very strong men and very hard to kill," and he has no doubt but that "the lieutenant and interpreter found everything very satisfactory on board her half an hour after what must have been an exciting scene." In Mecca the author met with an English lady whose history and antecedents are somewhat mysterious, and add to the interest of this really extraordinary book. The pilgrimage was a very bold and adventurous under-

taking, and we hope that the pilgrim will shortly give us an account of his further adventures at Medina and of the rest of his career in the Hejaz which was, he tells us, one of such extraordinary adventures that he hesitates to publish it.

OUR RIVER.*

MR. LESLIE'S book on the Thames, with the motto *Thamesis meus ante omnes*, is as opportune in its appearance as it is delightful to read. There never was a book less literary in form. The author has succeeded, perhaps with no great effort, in the difficult task of writing as people speak. His style "seeks digressions," as Herodotus says of his own, and wanders about through river scenery, in a profusion of back-waters, and clear pleasant channels. Mr. Leslie has not, fortunately, attempted to write a methodical guide-book to the Thames with descriptions of the seats of the nobility and gentry in the style of the house-keeper of the Marquis of Carabas. He has simply given his personal reminiscences of the river, of its pleasant nooks, its villages and inns, its boating-people, birds, artists, fishes, and botes. Mr. Leslie has been a friend of the river from his childhood, when he used to hire a boat at Hungerford Bridge, and row up to Vauxhall or Chelsea and back. The Thames has greatly changed for the worse since that golden time, when arrowheads flowered and swans floated on the banks where the District Railway burrows and carries a weary crew of passengers through a sulphurous atmosphere. Once Mr. Leslie broke a scull in a schoolboy expedition, and had to leave his Greek lexicon in pawn for the exorbitant sum of five shillings. Apparently this depressing incident happened before the era of Liddell and Scott; Schrevelius was the hostage.

An affection for a river, once conceived, is never lost. The lovers of streams are as constant as their patroness, beautiful Tyro, in the Odyssey, who lost her heart to Eriopous, "far the fairest of the streams that wander through the world." Mr. Leslie does not seem to have flirted with Tweed, or Uak, or Avon, but to have remained true to the object of his first affections. The years and the inexorable march of stupidity mar the Thames; there are iron railway bridges, improved and hideous weirs, and, worst of all, there are steam-launches on the sacred waters. Mr. James Payn has lately published—we trust in a spirit of fine irony—his opinion that life on board a steam-launch, with endless luncheons thereon, is the roof and crown of athletic enjoyment. And a more practical and persistent votary of the practice defends it in public, on the ground that he himself "has been launching for years." But Mr. Leslie holds launches in the deep and just abhorrence which Mr. Frederick Walker expressed years ago in his caricature of the selfish launcher. Here is Mr. Leslie's statement:—

The much vexed question as to the use and abuse of steam launches on the river would, from its importance, require a whole chapter to itself; but as I am perfectly hostile to the launches, and it may be, slightly prejudiced in the matter, there would not be much use in my attempting to discuss the subject in an argumentative manner. I would, therefore, rather class the launches amongst those things which, in my opinion, are simply mistakes. I do not believe it is possible to really appreciate the river from on board a launch. The motion of the boat causes the perspective, both in front and behind, to alter so rapidly in a converging and diverging manner, as to have on the eye quite a painful effect, which after a short time becomes very wearisome. In the bows the wind and spray render a steady gaze ahead very uncomfortable, and a smoke out of the question. In this part of the vessel the passengers generally sit, as depicted in Walker's inimitable drawing in "Punch," with their backs to the view. In the stern the view is spoiled by the launch's smoke and swell, the banks are washed by a travelling wave, and the pretty floating weeds are all in wild commotion. Here, too, all is gritty and black from the smoke-stack, and the odious smell of the rancid engine oil is anything but the attar of roses.

And he says, with just contempt, that what the owners of launches like is "to have an excuse for wearing the manly flannels of the rowing man without exercising a single muscle in them." He is sure the people on board do not feel happy; "they are generally rather pompous," and perhaps "a little grain of conscience makes them sour." On the whole, he attributes the existence of steam-launches to idle selfishness, vanity, greed, and stupidity. For our own part, we think that a man who can enjoy a steam-launch would, in favourable circumstances, have greatly exceeded the iniquity of Nero. That Emperor, at least, was an artist, and to him a steam-launch would have been an impossible abomination. But Mr. Leslie mentions two exceptions to a general rule, two owners of launches who are not so bad as they might be. May they be converted!

Let us leave a disagreeable topic and return to the Thames. "All bridges are delightful to look over, but Henley is the best in this respect I ever knew," says Mr. Leslie. The pleasure of reading his book is very much like that of looking over a bridge. The clear stream flows by, carrying flowers and water weeds in the shape of pleasant memories and fragments of good-natured gossip. What can be better than this little sketch of a summer night in the old years that do not come again, when England was strong by land and sea, and grew her own corn in abundant harvests?—

My father once or twice described this journey to me. It took place in the latter part of the month of August, the moon shining so brightly that the labourers were at work in the fields all night getting in the *fat*

* *Our River*. By George D. Leslie, R. A. Illustrations by the Author. London: Bradbury, Agnew, & Co. 1881.

harvest. A sailor travelled with them who had been in the actions of Trafalgar and the Nile, and who had many exploits to relate; he put on nothing extra in the way of clothing as night approached, and on my father asking if he was not cold, Jack replied, "No, sir; I have a great-coat, but it is stowed away in the hold, and it is not worth while getting it out." He had a cutlass wound in his head so deep, that he could put his two fingers into it; he told how the crew of his ship, having received their Trafalgar medals, went off for a day's liberty; not five returned to their ship next day who had retained their medals. Poor Jack, it was ever thus!

Mr. Leslie has very little to say about the river above Culham. He was much disappointed with his first visit to Oxford. It is true that the river does not play its proper part in the beauty of that "sweet city with her dreaming spires." The Isis is too much a mere exercise-ground of Eights and Torpids. "The only college that came up to my ideal was Magdalen," says Mr. Leslie; but, if Wadham, or John's, or Merton had only the river in their gardens, he might also have found his ideal there. It is true that Oxford is not built of "good honest red brick"; red brick could never have given us Magdalen or Merton tower, though adequate to the production of Keble. And it is only too true that "the whole place seems to be perpetually having new patches put up all over it." But that is the fault of the baneful class of reformers who are always harring the colleges with commissions, and compelling them to throw away their money on stone and lime, for fear it should be spent on endowing Prigs, and encouraging the science of Philological Hypotheses. In his heart Mr. Leslie is a Cambridge man. "Thebes did his green unknowing youth engage" with the charms of the Backs of the Colleges, and the red bricks of Queen's.

A very interesting part of *Our River* is concerned with that admirable and deeply regretted artist, Frederick Walker. Unlike Mr. Leslie, Walker was an angler, and threw a fly very well. He would anchor a punt in a place where a big trout was known to dwell, and there he would interrupt his painting to cast again and again over the fish. But the Thames trout were too clever for him, as they are for most people, and it was only on his last visit to the river that he "gruppit" a good one, near Monkey Island. Many people who admired Walker's large unfinished piece "The Mushroom Gatherers" will be interested in learning that it was painted over a Thames scene, with boys bathing on the river bank. As for the actual picture of "The Mushroom Gatherers," which is now in Mr. Leslie's possession, the owner says, "the whole remains a vast dreary blank field, with a mournful and brooding sentiment about it. To me its beauty is the poetic feeling it seems to convey of Earth, Mother earth. One can imagine easily the weight of the whole world, beneath the finely toned grass." There can be no more felicitous criticism. Walker, like some other men of genius, "was very fond of cats, and had a degree of influence over them quite peculiar; he appeared to understand their language, and by talking to them could always succeed in attracting their attention towards him. Another resemblance in this respect to Sir Edwin Landseer." Passing, by a sudden transition which the pleasant desultory character of this work must excuse, from cats to fowls, we come to this singular piece of observation, worthy of a place in Mr. Herbert Spencer's book on "Ceremonial Government":—

When a hen feels itself too small and weak to attempt a battle, it will approach the other with a humble expression, and holding its head down, will remain perfectly motionless whilst the other hen pecks it lightly on the comb two or three times. After this the two are friends, only it is always understood that the weaker one takes rank beneath the other. I have seen this happen so very often, that I am sure it is a regular custom—a sort of swearing fealty to a master, not unlike the customs of barbarous nations.

The Thames is naturally the haunt of artists. Mr. Leslie even feels inclined to think there are too many of them in some districts. But one may see almost as many white umbrellas between Loch Awe and Dalnally as where

"Every soul is sick of Knowle,
At Haddon Hall one grumbles,
Of Stratford Mill we've had our fill,
And murmur at the Mumbles."

At Wargrave Mr. Hodgson and Mr. Leslie have painted the sign of the George and Dragon; St. George militant is by Mr. Leslie; St. George triumphant, with a large flagon of ale, is by Mr. Hodgson. "They look already very old-masterly."

We have marked for quotation a number of amusing and interesting passages in *Our River* which want of space prevents us from extracting. The account of Mr. Mason, the artist, is very touching; the description of children bathing (p. 53) is a picture in itself. The pages on the art and mystery of managing a punt are useful, as are the directions and hints about the depth of water and the nature of the river bottom in various channels. The passages on natural history are full of delicate observation, and there is much that astonishes in Mr. Leslie's account of river waifs and strays (p. 234-235). The whole book will, we think, please all readers who are neither cockney anglers, obstructive owners of land adjoining backwaters, or owners of steam-launches. The drawings of scenery and figures are extremely delicate and touched with feeling. Among our favourites are "Landing Place at Monkey Island"—where reeds and poplars combine with soft summer skies and the wide river reaches to make a harmonious environment for a punt with a lady in it—"The Author's Punt" and "Entrance to the Backwater, Polney Reach," a remarkable study of luxuriant river vegetation, broken by the sterner lines of poplars. In "Thames Swans" we are not certain that the art of the wood-cutter has been adequate to the difficult task of render-

ing very delicate reflections, and their wavy lines and ripples of light and shade. "Patrick's Stream, Ship Lake," is another exquisite drawing of flowery fields, crowned by wooded hills. Mr. Leslie's book will delight every reader who loves to linger where, as a poet of the Thames sings,

A rushy island guards the sacred bower,
And hides it from the meadow, where in peace
The lazy cows wrench many a scented flower,
Robbing the golden market of the bees;
And laden barges float
By banks of myosotis;
And scented flag and golden flower-de-lays
Delay the lingering boat.

THE COMPREHENSIVE ATLAS.*

THE duty of the critic is to deal with all books impartially; nor should he be deterred from pointing out flaws or faults, where it may be necessary to do so, by any consideration of the toil or cost spent upon the work. But there are faults which mar the value and usefulness of a book, and there are others which prove little more than that no human work is perfect. In the case of the magnificent Atlas offered to the public by Messrs. Collins, the labour and outlay expended must, without doubt, have been very large; and it is but bare justice to say that they have been expended to good purpose. In the maps showing the present extent and position of the several countries of the world we believe that no serious deficiencies will be found; and that the information which the student may perhaps seek in vain in one map is fairly supplied in another. This must to a large extent be the case, unless the scale is so increased as to make the volume disagreeably unwieldy. On the whole, the work is one which may without hesitation be recommended as trustworthy and satisfactory, and there are but few volumes of maps of which it would be prudent to say much more.

Why the title-page should bear no date of publication, we cannot say. The lack is perhaps accidental, though in some similar publications it serves as a convenient means of covering defects which should have been supplied already. The railway map of Scotland does not show the completion of the line to Oban; it is possible and likely that the map may have been worked off before the new portion was opened. But it would have been well to anticipate all disparaging remarks by mentioning in a preface or advertisement the precise time down to which the maps have been corrected or filled up. The series of historical maps of Europe ends in 1871; but the maps of South-Eastern Europe and of Western Asia show changes subsequent to the recent struggle between the Czar and the Sultan. We are puzzled also at finding that the pages of Mr. Bryce's treatise on Physical Geography are numbered from 125 onwards. This treatise is respectable, and may perhaps be read continuously by those who do not mind travelling with the eye over a folio, and who may be satisfied with rather flattering likenesses of Negroes, Malays, and Red Indians. The reader may be struck with the differences in density of population between one country and another; but, though he may see a noteworthy fact in the statement that Belgium maintains for each square mile a population nearly twice as large as that which is furnished for the same space by Great Britain, he may get a mistaken impression from the division which speaks of the numbers professing the Christian religion as about 355 millions, Islam numbering about one-third of that number; while "those attached to one form or other of heathenism" exceed 700 millions. It is surely time that this fashion of putting Buddhists of every shade of thought into one lump with Bheels, Khonds, and Hottentots should be brought to an end.

It is from no wish to depreciate this work that we mention a few instances in which it might have been improved by the bestowal of a little more care, and perhaps by the exercise of a little more judgment. The map of Africa, No. 5, gives us the position of Basutoland; the index does not contain the name; but, on looking to the more detailed map, 34, of Southern Africa, we found the name given as Bassuto, and so inserted in the index. Griquas are seen, but our questionable instruments or allies, the Svatizies or Swatzies and some other tribes, are invisible. Not seldom, even in maps on the scales employed in this work, names may be omitted from sheer lack of space; but, if it was not easy in the railway map of England to insert any names between Basingstoke and Kingston on the South-Western Railway, the line indicating the connexion between Woking and Ascot might without difficulty have been introduced, as such lines might with ease be given for sparsely peopled districts in Scotland and elsewhere. The map entitled Palestine in the modern series is open to stronger objections. To quarrel with it for being so entitled might be hypercritical; but although many names in it remain unchanged from the days of the Herods, yet Abilene and Trachonitis are not divisions known at the present time; and nothing is gained, but much is lost, by introducing the twelve portions of the old tribes. The plea that they are here given because the map of "Palestine in the time of Christ" shows the country under the divisions of Judæa, Samaria, and Galilee, can scarcely be re-

* *The Comprehensive Atlas of Modern, Historical, Classical, and Physical Geography. With Descriptive Letterpress of Physical Geography.* by James Bryce, M.A., LL.D. London and Glasgow: W. Collins, Sons, & Co.

ceived as valid. In the modern map the tribes are utterly out of place.

When to these abatefments we add that it would have been well if the mountain ranges could have been made more prominent, and in some cases the breaks in their continuity more distinctly pointed out, we have no further fault to find with the series of modern maps, which may be fairly spoken of as excellent. Such a break in a mountain range we have in the valley which intervenes between the Nilgherry and the Palnai Hills in Southern India; and this break, more clearly traceable in the general map, No. 23, almost vanishes in the more detailed map of the Madras Presidency. Inconsistencies in the spelling of Indian names must be laid to the charge of all English writers who deal with them. The controversy raised about such names as Gandamak and Kolhapur may become as keen as that which seeks to determine whether we shall write in old European and Asiatic geography Calcutta or Kalkinai, Aigai or Æga, Korkyra or Coreyra. It may be as difficult to hit on a consistent system in one case as in the other; but it might at least be settled which form we should adopt when we are called to take our choice between Bejapoor, Beejapore, and Bijapur. The Indian maps will certainly not suffer because they fail to exhibit the scientific frontier which was supposed to have been won by the Treaty of Gandamak, and content themselves with the more familiar boundaries of older days.

But we are not sure that the publishers might not have consulted their own interests better had they attempted less in the historical maps and in those which profess to deal with the geography of the ancient world. These maps lack the exactness of Houz6 and the clearness even of Spruner's smaller School Atlas. We do not much care to see a map of Britain under the Saxons as a pendant to a map of Britain under the Romans, when this map itself plainly shows that it was not under Saxons exclusively. A small map of the British Islands in which the chief battle-fields are underscored, with their dates, makes up for the absence of some well-known names in the modern map, and is followed by a useful series of maps of Europe, ending with one describing the condition of things in 1871. The map which is designed to illustrate the history of India for the last three or four centuries seems to throw but little light on the existence or the extent of the empire of Akbar and Aurungzebe; but it is impossible that a single map should serve a purpose for which a dozen would scarcely be too many. Facing this historical map of India we have another which professes to give the world as known to the ancients. On the subject of such maps we have spoken plainly in the remarks which we made on Mr. Bunbury's *History of Ancient Geography* (*Saturday Review*, March 6 and April 3, 1880), and again on Mr. Keith Johnstone's *Geography* (*Saturday Review*, July 4, 1880). Unfortunately, these maps represent simply our knowledge of countries which were known to geographers before or after Ptolemy in a totally different way. Mr. Keith Johnstone's little sketch maps implied that explorers started with some fair conception of the scanty regions with which they had some acquaintance, and that they proceeded slowly but surely to fill up with some approach to correctness the outlines of the larger world which lay beyond them. The reproduction of a mathematically exact modern map, cut down to the limits known to ancient explorers, conveys a most erroneous notion of the state of their geographical knowledge; and if an atlas deals with the matter at all, it should do so by giving at least four or five maps exhibiting the plan of the world as it was conceived by Hecateus, Herodotus, Eratosthenes, Strabo, or Ptolemy. We are only going astray if we allow ourselves to fancy that the ideas of these and other geographers of the ancient world in reference to the relative proportions of the Peninsula of India, of Ceylon, and of China had more than the most remote likeness to our own, or even that in many cases they had any likeness at all.

Nor can we see much use in the map which does duty for ancient Greece. The later fortunes of the country have been pretty fairly exhibited in the modern maps and in the European historical series. It may be feared that this solitary map of ancient Greece may be taken by some as belonging to the whole period which preceded the fall of Oorinth, or even the exploits of Dexippus at Athens. In this map Messenia looks as if it had an independent existence equal to that of Attica; and Megalopolis is given as an Arcadian city which may have been as old as Argos or Mantinea. There is nothing to show that Athens had greater power and a wider confederacy at one time than at another, or that Sparta and Athens headed rival confederacies at any time. These remarks apply, it must be confessed, with not less force to the Map 86, entitled Asia Minor, in which Lydia figures in its usual proportions between Mysia on the north and Caria on the south, just as though the kingdom of the Mermaid kings had never exceeded these limits, or had retained them for ages after the fall of Orceus. To the once useful map of the world, giving the discoveries and colonies of the European nations, no further exception can be taken than that it does not show with sufficient prominence the vast extension already acquired by the English-speaking race. There is no reason why the same colour should not in such a map unite the territories of Great Britain in North America with the United States, as the name of the latter, with the statement, as here given, of their independence, would suffice to show that they now form a distinct nation.

The volume is well furnished with a series of physical maps of the great continents, and of the British islands, as well as with another series of four maps showing the mean temperature of the air throughout the world during the four seasons of the year. These

are followed by others giving the distribution of the winds, of rain and snow, of volcanoes and earthquakes, of ocean currents and river basins, and, lastly, of the several members of the vegetable and animal worlds. The work closes with an index drawn up with a fulness and care which makes it worthy of the work. Of the appearance of the maps we cannot speak too highly. It is refreshing to the eye to rest on a surface in which so much is given without confusion and without straining the powers of ordinary sight.

SYDNEY.*

THERE is so much to commend in this novel that the reader is apt to overlook the faults which belong to its kind rather than to itself. It is a simple study of character, without any setting of landscape or philosophy, of studied style or of original thinking. In days more propitious to the drama it would have taken shape in a little three-act comedy, and would not in that form be very different from what it now is. But, if it is a slight affair, and reminds us of *Eugenie Grandet* chiefly by means of a ludicrously strong unlikeness in treatment and literary charm, it is negatively good, and, as novels go in England nowadays, we may even perhaps say very good indeed. All the characters are virtuous and agreeable people, without being at all goody; the scenes are truthfully drawn and without exaggeration, while a pure and wholesome moral atmosphere pervades the whole story. The chief personages are rich, without coming down to breakfast in purple velvet, or dining off gold plate; and afterwards, when they are reduced to poverty, they do not batten upon half-a-pound of "Dorset" in a garret. We are glad to see that Miss Craik refuses to have any part in that violent ostentation and tasteless vulgarity which are fast destroying the English school of domestic novel. Her characters converse with extreme ease and simplicity, and the dialogues form so very large a proportion of the book as to increase that impression of its being a play to which we have already referred. To the character of the heroine we shall give our attention presently; we may simply say now that it is a distinct success. The other women in the novel are scarcely less excellently drawn, and there is one remarkably good child. On the other hand, the hero is somewhat indistinctly given; although he is in our company almost incessantly from the beginning of the book, we have formed no particular impression of his personality when we close the third volume. We must grant, however, that the two young men who are introduced as a foil to the hero are very well presented in a mild and superficial way.

The main subject of the book is the development, through unusual suffering, of the slightly eccentric, but thoroughly loyal and sincere, character of the heroine, Sydney Godwin. She is well described in a few words:—

Sydney had been reading, and her book was still open upon her knees. She was a large, fair girl, with a quantity of blond hair, and changeable grey eyes, a girl whom many people did not call pretty, but whose claims to beauty provoked a good deal of discussion amongst her acquaintance generally. There were some who admired her greatly; some thought her noticeable; one or two before this time had fallen in love with her. But, on the whole, she was not considered very handsome. It had been said of her often that you could not help looking at her, but that she was a girl who, before you could come to any settled opinion about her, forced you to change your mind a dozen times.

Miss Craik contrives cleverly enough to keep this questionable beauty, this dubious quality of individual distinction, before us all through the novel, and though Sydney's personal appearance is scarcely alluded to again the reader is constantly allowed to divine the puzzling effect that her looks and manners have upon strangers. Sydney is a girl of great possibilities of character, slow-growing, indefinite still, and not by any means precocious. The interest of the romance rests in this—that the large, undeveloped creature is not left to ripen her powers gradually, but is forced, by a domestic crisis, to enter on the embarrassments of life too soon for her strength. How she suffers and how at length her radical health of character redeems her are points of real interest to the reader, which are skillfully brought forward by the author, mainly by the best of all means—namely, by dramatic conversation.

Sydney Godwin is the only child of rich parents—a father of considerable age, already somewhat obfuscated by an unbroken round of city anxieties and responsibilities, and a mother of no very special intellectual power, but full of tact and womanly sweetness. Sydney, at the age of twenty, is the large, blond, indecisive personage to whom we have been introduced, dowered with more than her mother's intelligence, but at present not half her genial and unselfish sweetness. She is not consciously or prominently selfish, but she is not so thoughtful for others as deeply immersed in the contemplation of her own soul, and the analysis of all her own impulses and prejudices. The early chapters give an amusing, if slightly prolix, account of a Christmas party at the country house of the Godwins, a party got up, a little against Sydney's wish, to gratify the full and hospitable heart of her mother. Two nice young gentlemen are invited to amuse two pretty young ladies. The latter distress Sydney by their frivolity, and the former bring her contempt down upon them by a little innocent flirtation. Sydney is so earnest in convincing the two gentlemen of their errors in propriety that she piques them both into what really amounts to something very like flirtation with herself. In the case of

* *Sydney*. By Georgiana M. Craik. 3 vols. London: Hunt & Blackett.

one young gentleman, Mr. Marmaduke, a penniless person of very large and aristocratic expectations, it does, in fact, ripen, though neither of them realize it, into a warmer and sincerer feeling. As Sydney is still young in character, and as it is out of the question that Mr. Marmaduke should marry at present, the intimacy is allowed quietly to drift down towards the crisis of betrothal, when suddenly a much more drastic crisis gives a new direction to all their lives. Mr. Godwin speculates and loses his entire fortune, the shock, at the same time, completing the overthrow of his intelligence.

All this while a neighbour, a Mr. Loudon, a bachelor of over forty, has been in the habit of constantly joining the party at the Godwins', with whom he has been on intimate terms all his life. He is a very kind and genial man, and has remained unmarried that he might give his whole attention to his aged mother, who has lately died. It becomes plain to the reader, but not to Sydney, that he has gradually fallen desperately in love with her, and that he is only waiting for a fit opportunity to ask her to be his wife. Unfortunately, without his noticing that anything has happened, she has become convinced, through her icy maidenly reserve, that there is something charming to female youth in the masculine freshness of five-and-twenty. When the crash comes, Mr. Loudon thinks that his chance has come; he takes the Godwins into his house, and he persuades Mrs. Godwin, on whom the whole responsibility has fallen, to accept the present necessities of life from his purse; and then he very rashly and abruptly proposes to Sydney. To her he seems old and repulsive; not at all realizing or knowing the particulars of his generosity, she thinks it mean of him to thrust his unwelcome love upon her at such a moment, and she refuses him with indignation. He acts very kindly; gives her an opportunity of appearing to be earning her living by finding a situation for her in Switzerland as teacher of English to two German girls; and to the shores of the Lake of Thun the three Godwins presently repair.

But Sydney gains very little by her teaching, and, as her father becomes more and more hopelessly invalided, various delicacies and expensive contrivances are required for him, and found no sooner than required. It takes her inexperience a long time to come to the certain conclusion that Mr. Loudon is paying for all these things, and, when she charges her mother, that worthy woman tearfully confesses to the impeachment. Sydney's pride is deeply wounded, and she begs her mother to return him his money and accept no more, but she soon learns that this is simply an impossibility. Mr. Loudon takes her like a butterfly in the delicate but pitiless net of his generosity and his determination, and at last she consents to marry him for her parents' sake, not at all for her own. The beginning of a married life so started upon is, of course, extremely distressing; but, although both husband and wife have taken so perilous a step, neither quite realizing what was being done, the radical goodness of them both, assisted by several gods out of machines, leads them very prettily into unison of heart at last. How this is effected, of course, is Miss Craik's secret, and one that we recommend our lady readers to find out for themselves. It is a very pretty story, cleverly devised and wholesomely carried out.

One of those hitches or uncorrected alterations of intention, which amuse the reviewer as much as the failure of a piece of scenery to descend amuses the playgoer, occurs in the first volume, and should certainly be corrected. Mr. Marmaduke, the handsome young man, plays so slight a part in the story that Miss Craik meant to say good-bye to him early in the first volume, and accordingly wrote in the most circumstantial language:—

But before another week had gone the Godwins had left the Hall, and Mr. Marmaduke and Sydney never met again. This proved to be their last parting.

Unfortunately, in the course of the second volume, the effect upon Sydney of seeing once more the handsome face and hearing the cheery voice of her early flame was too great a temptation for Miss Craik to resist; and, in forgetfulness of her solemn asseveration, they did meet again. Nor did even this "prove to be their last parting"; for, quite well on in the second volume, the prophetic soul of the reader is perplexed by another interview between these young people. This however, as the playbills say, is positively the very last parting. This error, however, suggests some strange reflections. It could not have occurred if the volumes had undergone the most ordinary revision at the hands of the author, or even of a tolerably efficient press-corrector. What would the dear old lady-novelists of eighty years ago—the Amelia Opies and the Sophia Lees—have said to a sister of the pen who could not remember in her second volume that she had parted her lovers for ever in the first? They could recollect the tenor of a courtesy or the accident of a shoe-tie although ten serious tomes lay between them and the incident. Miss Craik is quite clever enough to make it worth her while to take more pains, to study her modes of expression, and give more unity to her plot. We hope that the next time she gives us a novel we may discover no such indications of unseemly haste.

FRENCH LITERATURE.

THE second volume (1) of M. Taine's *Origines* is a curious commentary on an expression which he himself used—is it twenty-five or only twenty years ago?—in reference to Mr. Carlyle's *French Revolution*. In that book, said the critic who thought

(1) *Les origines de la France contemporaine*. Par H. Taine. La Révolution. Tome II. La Conquête Jacobine. Paris: Hachette et Cie.

that everything was explicable easily by half-a-dozen formulas, "les événements si nets que nous connaissons tous" were obscured and rendered mysterious by passion and wilful humour. *La Conquête Jacobine* is a singular vindication of the elder historian. Evidently the *événements* have come to seem much less nets to M. Taine. All his great learning and all his admirable power of lucid exposition do not avail to hide his own obvious astonishment at the way in which a faction numerically insignificant (M. Taine agrees with those who doubt whether there ever were much more than a quarter of a million actual "Reds" in the whole of France) plunged a great nation for years into the wildest excesses of absurdity and of crime. The account of these excesses, however, is as unsparing as it can be. So much misplaced ingenuity has been spent of late by the Neo-Dantonist followers of Comte in whitewashing the Septembriseurs, that it is quite refreshing to find the literal facts, hideous as they are, set forth once more without the least exaggeration, but with all the advantages of literary skill. Considering the present complexion of affairs in France, M. Taine's book is rather a bold one, and ought to be salutary, though it probably will not be. The intolerance, the phrasemaking folly, the bloodthirsty partisanship of the old Republicans are here set before the new Republicans without fear as without favour. But the book is one of far too much importance to be despatched in a brief notice.

The *Correspondance* (2) of Talleyrand with Louis XVIII. during the Congress of Vienna is another book rather to be mentioned than noticed here, especially as it has appeared simultaneously in English. It may, however, be observed that M. Fallain's editing is exceptionally good. Not merely are the fullest details as to things and persons mentioned given in the notes, but there is an *index nominum* which is in reality a small biographical and geographical encyclopædia. It is very seldom that the idle reader is saved all trouble so adroitly, and that at the same time the studious reader is assisted so skilfully with all necessary helps to his study.

M. Pégot-Ogier has written a learned and complete history (3) of the Channel Islands, the only fault of which is that the author has strayed unnecessarily, perhaps we should rather say unskilfully, into the history of France and England. The book is prefaced by a paper on the present condition of the islands, which shows M. Pégot-Ogier to be a strong member of the "French party," as it is locally called; that is to say, the party which desires—not by any means annexation to France—but the preservation of the existing autonomy, as distinguished from complete legislative union with England and representation in the English Parliament. Some of M. Ogier's statements in his preface are of doubtful accuracy. It is, for instance, quite untrue that secondary education is at a low ebb, though conducted à *grands frais*. The two endowed Grammar Schools, the modern Victoria College of Jersey and the ancient Elizabeth College of Guernsey, supply at very moderate *frais* an education at least equal to that of the most advanced English public schools, and infinitely superior to that of a French Lycée. When, moreover, M. Pégot-Ogier remarks that the islands are "plus libres que l'Angleterre, le pouvoir n'y est pas personnifié," he shows a spirit of idle theoretical Republicanism which is simply laughable.

Any one who should, in the language of an old *mot*, say that M. Jean Fleury's best work is Madame Henry Gréville, would do him some injustice. His excellent book on Rabelais is, taking it altogether, the best on the subject; and this on Marivaux (4) deserves, we think, the same commendation, though M. Fleury is, in our judgment, inclined to set the author of *Marianne* rather too high. The book contains a careful account of the life and writings of Marivaux, with (in an appendix) a reprint of several pieces which M. Fleury thinks have been unjustly excluded from the standard editions, and a good disquisition on *marivaudage*. This latter has always been a difficult thing to explain to persons (especially Englishmen) who do not know Marivaux. M. Fleury takes good literary standing ground when he selects euphuism and Sterne's peculiar manner as other species of the same genus. Had he known Lamb, which we are inclined to think he does not, a third example, still more instructive, might have been given. *Marivaudage*, in short, is an artificial style of writing, which is artificial after the peculiar fashion of Marivaux; and, if any one is not satisfied with this variation of the famous definition of an archdeacon, we must refer him either to Marivaux himself or to M. Fleury.

M. Décès's rather formidable volume (5) of philosophical dialogues is an attempt once common, but now rare, at producing, not exactly a *théodicée* or a theosophy, but a reconciliation between faith and science. In the author's own words, his effort is to discover "by the experimental method the principle of causality and the first cause." We shall not attempt here to determine how far this somewhat ambitious quest has been achieved. It strikes us, however, that, like all dialogue makers, from Socrates downwards, Dr. Décès is rather prone to set up the opposition only just strongly enough to give the champion whom he favours some credit for knocking his enemy down.

A tractate (6) on the famous *énigmes arithmétiques*

(2) *Correspondance inédite du prince de Talleyrand et du roi Louis XVIII.* Par G. Fallain. Paris: Plon.

(3) *Histoire des îles de la Manche.* Par M. Pégot-Ogier. Paris: Plon.

(4) *Marivaux et le marivaudage.* Par J. Fleury. Paris: Plon.

(5) *Science et édit.* Par le docteur J. B. L. Décès. Paris: Plon.

(6) *Le nombre géométrique de Platon.* Par J. Dupuis. Paris: Hachette.

œuvres, which puzzles all readers of the *Republic*, is also a somewhat antiquated exertion, though it is not the worse for that. M. Dupuis comes to the conclusion that the mysterious number = 100 × 216. He gives a history of the various interpretations; but it is rather odd that a student of Platonic mysteries should quote Philo on the authority of Jean Bodin.

M. Salvador's reprinted treatise (7), or rather collection of reprinted treatises, on the religious question is a curious but not very enlivening book, in which remarks on the Crimean War, arguments to prove that the Crucifixion was, in the first place, an act of deicide, then of populicide, then of legicide, and many other strange things are gathered together with a kind of serious simplicity which, at any rate for a time, supplies the want of practical force, method, and style.

It is well known with what zeal and success M. Ernest Daudet has devoted himself to the local history of the south of France during the Revolutionary period and that of the Restoration. He has now followed up his *Torreur blanche* by an account (8) of the obscure Royalist conspiracies a quarter of a century earlier, at the outbreak of the Revolution, of which the mysterious camp of Jalès is the principal mark in the memory even of most of those persons who know the period fairly. M. Daudet has told the story clearly and well. His book has a good map, which is not unnecessary, for Jalès is not marked even in the excellent departmental maps which accompany the *Guides-Joanne*, much less on the usual maps of France.

Another contribution to the history of the Revolutionary period, of more personal interest though of less actual importance, is Baron Ernouf's *Souvenirs d'un jeune Abbé* (9), the letters of a young priest who was obliged to join the Republican army, and served in the campaigns of Flanders (1793-94), the Lodi campaign, and the siege of Genoa. The editor has subjoined some interesting minor documents bearing on the period.

M. Rolland has translated a selection (10), as it seems, of Mendelssohn's Letters of 1831-32.

The late M. Edouard Fournier's interesting and characteristic *Paris capitale* (11) is a not unworthy finish to the numerous and innumerable studies of old French history or literature, which he long made palatable to a public more difficult, as to the matter of its literature, and certainly more difficult as to the form, than our own. It is many years since M. Guesard (to whom literature owes the publication of at least a considerable part of the unequalled treasures of early French epic) confessed with much amiability in reference to Fournier that this public "le lit et ne me lit pas." The author of *L'esprit des autres* was worthy of the compliment. He had his weaknesses, as, for instance, in the present volume the astounding discovery that the humour of England is due to a pre-Cæsarian emigration from Lutetia to England may serve to show. They must have carried the plant, roots and all. But with a certain combination of real erudition with picturesque condescension to the needs of the average reader, M. Fournier stood almost alone, and we do not know that he has left any heir to his qualities.

M. Marius Topin is not an extraordinary critic, but of the ordinary critic he is a very good specimen indeed. These republished papers (12) on French novelists sin, if they sin at all, by an excess of charity. We are not disposed to acquiesce in the exaltation of Gabriel Ferry, in which M. Topin indulges, and his remarks (very respectful ones in the main) on Flaubert show that eradication of the humorous element which M. Fournier, as we have just mentioned, has accounted for in a manner surprising but satisfactory. But the papers are very good as far as they go, and we should be hard put to it to match them in the average reviews of English periodicals.

A convenient edition of Doudan's *Pensées et fragments* (13) puts the thoughts of that noteworthy thinker within the reach of everybody. The author was one of those rare persons who in this hurried age carry out the principle of the Scotch warning, "Tak' time," and his work is valuable accordingly. It is possible often to differ from him; never to disdain his results.

Colonel Trumelet (14) has done a real service to literature in collecting and commenting the legends of the Algerian saints which he has come across. The book is well written, very unusual in kind, and very well worth reading.

If any one can be thought worthy to figure in the pleasant series of small quarto books on good paper, with ample margin, which M. Calmann-Lévy has instituted, that person is Heine. The man whom two great nations dispute—one alleging him to be a German strayed in France; the other, a Frenchman strayed in Germany—whom all Europe admires, and in whom critics, not incompetent to decide, see the greatest man of letters of the pure nineteenth century, cannot be too fully illustrated by criticism and biography. These reminiscences (15) of his niece, the Princess

Della-Rocca, are very unpretending in character, but full of interesting personal details.

Sensible angels of the critical kind—if there be any angels who are critics—fear to tread on the character of Alceste more than on anything else, except the character of Hamlet, in drama or literature. M. Coquelin, however, has a perfect right to give his opinion (16), an opinion which is recommended by quite other qualifications than those of the dilettante man of letters. M. Coquelin's point is that Alceste is a comic, not a tragic, character, and he supports it with some good argument. The subject is so dangerous that we shall offer no comment, except to draw attention to a curious difference which illustrates admirably the eternal variation between French and English conception of dramatic literature. If M. Coquelin professes Molière to Shakespeare (which he does with discreet hesitation), it is because "les individus créés par Shakespeare se démentent quelquefois; ceux de Molière jamais." Now we say that this proves our case, because human beings always do contradict themselves sometimes. But the vista of controversy which this opens is too appalling.

M. Jules Vallès has a bad name, which perhaps on any fair ground he ought to share with M. Gambetta and many other persons. Nevertheless, we are glad to welcome a new edition of his interesting book, *Les réfractaires* (17), a contribution to the history of *La sainte Bohème*, which must never be slighted. The singular article on Gustave Flaubert is perhaps the most curious feature of the book.

We can only mention a charming reprint (18) of a Flemish account of Vasco de Gama's second voyage, with a French translation, a preface, and a facsimile of a delightful sixteenth-century map, with a crowned and sceptred monarch sitting placidly in the middle of Africa.

The Persian Ladies' Book (19) contains many pleasing instructions as to what is or is not "wajib," that is, "the proper thing," under the various circumstances of feminine life. "Il est wajib de se laver trois fois la tête avec du savon" seems to show that most Persian ladies ought to have light hair, which yet history does not warrant us in concluding that they have.

The *Bibliothèque utile*, in three new numbers which have reached us, sets a disquisition on free will (20), one on the Pacific Islands (21), and a kind of boiled-down essence of positivism (22) from no less a pen than that of the indefatigable Dr. Robinet, within the reach of every Frenchman who has three times fifty centimes to spare.

We have no doubt that M. Maurice Block is in private life a most amiable gentleman, but his contributions to the *Bibliothèque des jeunes Français* fill us, we must confess, with terror. *Le budget* (23) and *L'impôt* (24) seem to be destined to create an infinite number of the same sort of persons who (as M. Thaine tells us, or rather as he confirms our previous knowledge) were the curse of Republican France ninety years ago. A smattering of information on public affairs is a terrible thing. The same fault cannot be found with Michelet's *Henri-Quatre* (25), though it has plenty of others. At all events, it is not *bête*.

The Illustrated Catalogue of the Salon (26) deserves the attention of sensible people who, intending to visit the original exhibition, prefer to know what they are going to see beforehand.

Messrs. Hachette have begun in *L'art dans l'antiquité* (27) one of those elaborately illustrated books which they have few rivals in producing. The letterpress is excellent, and with the illustrations no fault can possibly be found.

In the *Revue des arts décoratifs* for April (28) we must notice an admirable etching of the southern door of Beauvais, one of the finest specimens of Renaissance work.

It is a serious thing to say to an Academician *Sat prata biberunt*; but really there does not seem to be much else to say to M. Feuillet, à propos of his *Histoire d'une Parisienne* (29). The Parisienne has an *éducation exquise*, the result of which, as it appears to a brutal Saxon reader, is to make her a very bad wife. She marries the first comer at her mother's bidding, and during the service—probably because she feels herself the centre of an imposing spectacle—she "touches heaven." But the unfortunate Baron de Maurescamp, though he is to all appearance

honestly attached to his wife, has a fashion of showing his attachment which revolts the young woman of the *éducation exquise*. She tries to make herself unpleasant to him, and he is so lost to decency as to accept the intimation. Thereupon she is not angry, only very very sad. A beautiful Comte de Lerne turns up, and Mme. de Maurescamp, who is sternly virtuous, accepts him for a *maître d'études*. The coarse Baron, who has already allowed himself to drop into the most regrettable entanglements with a young American person who drinks pale ale and porto (M. Feuillet seems to have mixed the vanities of the Anglo-Saxon race rather unhappily here, for Americans usually prefer lager-beer and champagne), resents this blameless friendship and slays the Cicisbeo. It is true that an accident has made the duel terribly unequal, but the Baron does not know this. The young woman with the *éducation exquise* first quits, but after a time returns to her husband, waits till she has found a male guest who can fence better than he, and then transfers her cigar to the lips of that male guest, adding, when he sends her a billet, saying that he will spare her husband in the consequent meeting, a delicate reply, "Ne vous gênez donc pas." This, according to M. Feuillet, who should know, is the result of bringing up young persons in a state of *candeur adorable* and *éducation exquise*. It is perhaps not surprising that we barbarians still prefer our barbarous methods.

It is very pleasant after this dull and unhealthy stuff, which nothing but M. Feuillet's skill as a workman makes even readable, to take up such a charming child's book as *Les enchantements de la forêt* (30). The opening story, describing how a valiant eight-year-old boy set out to discover the "Green Princess," and what he found, is as good a thing of the kind as we have read for some time. Another volume containing stories of no great length, but of considerable excellence, is *Une femme romanesque* (31). The title story, describing the temptation and victory of a country lawyer's wife, is very carefully and delicately done. The next, *Adrien Malaret*, tells of the woes and subsequent bliss of an inventor; and the third, pitched in a high key, but short, tells of an act of heroism in the Prussian war, which, if a few such had actually occurred, would have altered the history of that war not a little. M. Octulle Mendès is an accomplished writer, but we think we like him better in poetry than in prose. In *Le roi vierge* (32) he has tried apparently to combine the manners of his late father-in-law and of M. Alphonse Daudet—an unhappy combination. *L'ancêtre* (33) is a new working-up of a very old motive—the resurrection of a man embalmed alive a couple of centuries ago, and his consequent surprise at the manners of to-day. In general, of course, the thing is a little hackneyed, yet the particular application of the satire is smartly done, and often deserves a laugh. *La succession Marignan* (34) begins with a murder and ends with a drowning. The interval is fairly filled up, and we have read worse novels of the sensational kind. But the hero who "punctured" a bull-dog to death in two kicks must either have been capable of giving points to a Liverpool corner man or else must have had a terrible pair of boots on. It would seem that M. Georges Glatron (35), in gratitude for having (if we remember rightly) begun his career under the patronage of the *République française*, has vowed himself to the service of the anti-Church crusade. This is a pity, for he has capabilities. M. Darc (36) is to all appearance partly of the same faction. Now, novelists should not be of a faction. In *Les forces de l'ami Jacques* (37) M. Silvestre, who, like M. Mendès, is a poet who has clipped his wings for a time, has written stories often somewhat too broad for English taste, but amusing, and not very harmful according to their own standard. Lastly, *Un parquet en province* (38) contains some very fair character-drawing, but is perhaps unnecessarily tragic in tone.

- (30) *Les enchantements de la forêt*. Par A. Theuriot. Paris: Hachette.
 (31) *Une femme romanesque*. Par Claude Vignon. Paris: Calmann-Lévy.
 (32) *Le roi vierge*. Par Catulle Mendès. Paris: Dentu.
 (33) *L'ancêtre*. Par Victor Fournel. Paris: Calmann-Lévy.
 (34) *La succession Marignan*. Par Paul Saunière. Paris: Plon.
 (35) *Les disciples de l'abbé François*. Par Georges Glatron. Paris: Lemerre.
 (36) *Le péché d'une vierge*. Par Daniel Darc. Paris: Charpentier.
 (37) *Les forces de l'ami Jacques*. Par A. Silvestre. Paris: Ollendorff.
 (38) *Un parquet en province*. Par B. Arbré de la Roche. Paris: Calmann-Lévy.

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

THE UNITED STATES.

The Annual Subscription to the SATURDAY REVIEW, including postage to any part of the United States, is £1 10s. 4d., or \$7 58 gold, and may be forwarded direct to the Publisher, Mr. DAVID JONES, at the Office, 38 Southampton Street, Strand, or to Mr. B. F. STEVENS, American Agency, 4 Trafalgar Square, London. International Money Orders can be sent from any office in the United States, and Subscriptions, payable in advance, may commence at any time.

PARIS.

Copies of the SATURDAY REVIEW may be obtained every Saturday of M. FOTHERINGHAM, 8 Rue Neuve des Capucines.

THE SATURDAY REVIEW

POLITICS, LITERATURE, SCIENCE, AND ART.

Price 6d.

CONTENTS OF No. 1,336, JUNE 4, 1881:

Ireland and Conservative Criticism. The Transvaal.
 M. Gambetta at Calais. Mr. Blennerhassett on Minorities.
 The Civilization of the East. Branch of Privilege. Italy and France.
 Fishing Grievances. Hungary. Decoying.

Campden Hill. Dogs and Graves. London in Epsom Week.
 The First French Journalist. The Yacht-Racing Association. The Derby.
 The Rise in Securities. Recent Music. The Theatre.

Eighteenth Century Studies. Anat. Rhoades's Georgics of Virgil.
 The Library. Arabian Pilgrimages. Our River.
 The Comprehensive Atlas. Sydney. French Literature.

CONTENTS OF No. 1,335, MAY 25, 1881:

The Porte and the Powers.—The Preston Election.—The Irish Land Bill.—Jews in Russia.—Agricultural Depression in England.—America.—Local Indebtedness.—France.—Lunacy Law Amendment.

The Duke of Albany.—Whips.—The Curiousities of Games.—Exeter Hall and Mr. Bradlaugh.—Exits from Theatres.—The Isle of Saints.—Spring Fishing.—The Freight Prosecution.—The Adjournment of the Monetary Conference.—The Picture Galleries. IV.

William Whewell.—The Chaplain of the Fleet.—Proctor's Poetry of Astronomy.—The First of May.—Collected Works of Dr. Simon.—Japanese Poetry.—The Black Isles.—The Roman Poets of the Republic.—Cunningham's Churches of Asia.—American Literature.

London: Published at 38 SOUTHAMPTON STREET, STRAND, W.O.

ADVERTISEMENTS.

DORÉ'S GREAT WORKS, "CHRIST LEAVING the PRÆTORIUM," "CHRIST ENTERING JERUSALEM," and "MOSES BEFORE PHARAOH," each by 250000, with "Dress of Moses's Wife," "Christian Martyrs," &c. at the DORÉ GALLERY, 35 New Bond Street. Daily, Ten to Six.

THE GROSVENOR GALLERY.

SUMMER EXHIBITION.

Now Open daily, Nine to Seven.

Admission, One Shilling. Season Tickets, Five Shillings.

AIIVASOVSKY EXHIBITION.—"COLUMBUS'S SHIP" IN A STORM. "COLUMBUS LANDING ON SAN SALVADOR," and many other interesting works by AIIVASOVSKY, the greatest of Russian Artists. Now on View at the FINE ARTS GALLERY, 40 Pall Mall. Admission, 1s., from Ten until Six.

SWISS EXHIBITION OF SWISS SCENERY AND SWISS SCENES, by Swiss Painters. Instituted by the Cercle des Beaux-Arts of Geneva. 160 New Bond Street. Admission, 1s.

MR. MARTIN COLNAGHI (Guardi Gallery, 11 Haymarket). Begs to inform the lovers of Art that his FIFTH SUMMER EXHIBITION contains Works by the great courier, Hermann Phillips, others by Domingo and Chariemont, and by the young Spanish painter, Jose Benlliure. Open daily from Ten till Six.

THE Right Hon. W. E. GLADSTONE.—The fine original "BUST," from life, by J. E. BURN, Esq., A.R.A., now in the Royal Academy (Central Hall, No. 1407), will be REPRODUCED in WEDGWOOD FAIENCE, of an entirely new body and colour, for Subscribers only.—Prospectus, with Photograph and full particulars, sent upon application, to F. KATFORD, 71 King's Road, Brighton.

RADLEY COLLEGE SCHOLARSHIPS.—There will be an ELECTION to TWO SCHOLARSHIPS in June next: Sewall Scholarship, value £55, during stay at the School, and a Junior Scholarship, value £20, for four years, to which an Exhibition of £10 may be added. Boys must have been under 14 on January 1, 1881. Examination begins June 15. For further particulars, apply to the WARDEN, Radley College, Abingdon.

SOMERSETSHIRE COLLEGE, BATH.—AN EXAMINATION will be held on July 13 and 14, to elect to SEVEN ENTRANCE SCHOLARSHIPS.—Particulars may be obtained from the HEAD-MASTER.

ROSSALL SCHOOL.—ENTRANCE SCHOLARSHIPS.—Twelve to be competed for, June 28. Value from 70 Guineas (covering School Fees) to £20. Ages under 14 and 16. Candidates may be examined at Rossall or Oxford, as preferred, in Classics or Mathematics.—Apply to Rev. the HEAD-MASTER, Rossall School, Fleetwood.

HIGHGATE SCHOOL.—Sir R. CHOLMELEY'S FOUNDATION, 1665.—SIX SCHOLARSHIPS, £21 per annum, open to Competition in July.—Further particulars on application to the Rev. the HEAD-MASTER, School House, Highgate, N.

ST. EDMUND'S COLLEGE, SALISBURY.—A HIGH-CLASS SCHOOL for SONS OF GENTLEMEN. The religious training is upon definite Church principles. Boys are Educated with much care and thoroughness. They receive individual teaching and help wherever needed. Candidates for Matriculation at the Universities are specially prepared. Terms, £75 a year.—For references, prospectus, or any further particulars, apply to the Warden, Rev. G. H. BOURNE, D.D.

TRINITY COLLEGE SCHOOL, STRATFORD-ON-AVON.—The Warden, RICHARD CURRY, M.A., is assisted by Seven Resident Graduate Masters, two being specially for Modern Languages. Special preparation for the Universities, Army, and all competitive Examinations. Exhibition to the Universities of £20 per annum. Junior Department for Young Boys. Large Playing Fields, Gymnasium, &c. &c. Terms 50 and 60 Guineas.—Apply to the WARDEN.

FOLKESTONE.—Mr. W. J. JEAFFRESON, M.A. Oxon., assisted by a Cambridge M.A. and competent Teachers, prepares PUPILS for the Universities, Woolwich, Sandhurst, and all Competitive Examinations. A few Vacancies.

CARSHALTON HOUSE SCHOOL, Surrey.—BOYS carefully prepared for Civil and Military Examinations.

THE LAND BILL.

THE prospects of the Land Bill—or, rather, the prospects of any satisfactory result of that Bill—cannot be said to have been increased by the events of the recess and of its eve. The last meeting of Parliament before Whitsuntide was marked by almost all the possible symptoms of that condition into which the House of Commons sometimes gets when the majority are not wholly satisfied with their leaders and the minority are bitterly dissatisfied with their opponents. Acrimonious wrangling on trifles and a decided preference of such wrangling to serious business is perhaps the chief characteristic of this state. Nor can it be said that the attitude which the Government had assumed in the latest debates on the measure was calculated either to inspire friends or to disarm foes. Unwillingness to explain the definition of tenant-right has at last taken the form of a distinct refusal to attempt the explanation. When this refusal is coupled with an equally strenuous refusal to admit the claim of the landlords for compensation, it is impossible for the duller opponent, and hardly possible for the most ardent friend, not to put two and two together. The refusal of a definition of tenant-right can only mean the tacit acknowledgment of its identity with its epigrammatic equivalent. Definition would bring out the Land Bill wrong, and it is therefore withheld. If it be said that this is unfair, and that definition would have no such effect, the refusal of it becomes simply inexplicable. A word would free the Government from all trouble about compensation, and that word they refuse to speak. They can, therefore, without an exceedingly bad compliment to their discretion, be credited only with having something important to conceal. This is not a pleasant state of things for their supporters, at least for such of them as have not the guileless and childlike confidence of Mr. LEAKE. That a Government headed by Mr. GLADSTONE can do no wrong is a principle of political conduct which has the advantages of simplicity, but the disadvantages arising from a corresponding want of variety, breadth, and interest. There are, perhaps, some signs that the "simple and pathetic" attitude—to borrow the adjectives from the definition of the Iliad—common at the general election is giving way to one which, with a slight alteration from the companion definition of the Odyssey, supporters of the Government may call "complicated and immoral," but which may perhaps be more fairly characterized as one of critical common-sense.

The tone of the various recess addresses is tolerably conclusive evidence of this. Mr. CHAMBERLAIN spoke at Birmingham with a great deal of courage, especially in reference to the Transvaal. But when he came to Ireland his courage was displayed not in defending the Land Bill, not in explaining its disputed or incriminated provisions, but in justifying himself for being a member of a Government which was using force in Ireland. Mr. CHAMBERLAIN has discovered that, though force may be no remedy, it is occasionally an indispensable agent in treating certain kinds of patients. Furthermore, in an argument excellent in itself but singularly awkward and dangerous in the mouth of the speaker, Mr. CHAMBERLAIN testified that even landlords may have rights of property. There is no necessity to dispute a proposition so excellent and so truly conservative. But, as the Government have hitherto, in the opinion of all but their extreme parti-

failed signally to assure to this description of property the same rights which they assure to those kinds to which Mr. CHAMBERLAIN compared it, and as they are urging on a measure which, in the opinion of at least a considerable body of Englishmen, curtails those rights still further, the time and circumstances of the speech cannot be said to be happy. It would almost be wiser, and would certainly be simpler, to adopt Mr. LEAKE's attitude, and to say that it is all the fault of the Irish landlords for wanting to have their property protected, and not of the Irish Executive, as distinguished from the Government, for not protecting it. On the other hand, the various Opposition speeches, from that of Lord CARNARVON to that of Mr. STANHOPE, exhibited a degree of confidence and a forwardness of attack which have not been common since the general election. Lord CARNARVON and Sir R. CROSS in particular followed Lord SALISBURY and Sir STAFFORD NORTHCOTE with sounds which, whatever else may be said of them, were neither uncertain nor pacific. The aggressive tone of their speeches may grieve those excellent, but somewhat unpractical, persons who are constantly adjuring politicians of all parties to let bygones be bygones, and work together for the good of the country. But for all that their words will carry weight. There is hardly a statesman in England who unites the general respect for moral and intellectual qualities combined in a greater degree than Lord CARNARVON; a certain irresolution and a proneness to look at all sides of the question being almost the only faults found, or to be found, with him. Neither irresolution nor want of decided expression characterized the speech at Burton-on-Trent. On the other hand, if Sir R. CROSS's political opponents, and some of his political friends, do not see in him a great orator or a great statesman, they allow him a somewhat unusual command of administrative, and especially (if the word may be used) of legal-practical, detail. The supporters of a measure of which Lord CARNARVON condemns the principle, and of which Sir R. CROSS condemns the detail, at least cannot cavil at the competency of their critics.

It is not unworthy of notice that in some quarters the sense of danger to the Government if this Irish matter is not somehow or other hurried through appears to have prompted a decided advance in the tone taken about Irish claims. Landlords generally are spoken of offhand as "lessors," not owners, and the operations of the Property Defence Committee are put on the same footing as those of the Land League. If this latter proceeding is more than an excursion of indiscreet partisanship, it deserves a little attention. What Mr. GODDARD and his associates have been doing is, let it be remembered, not merely an act of ordinary commercial business, but one which will continue to be legal and necessary when the Land Bill becomes law. They have bought up in the open market and at the open market price the right of defining tenants in their holdings. In doing this they have been protected no doubt by police and by soldiers from the violence of the Land Leaguers. This is sufficient in the eyes of some controversialists to put the Land League and the Defence Committee on the same footing. So preposterous a misrepresentation is suitable enough in the mouths of those who in the teeth of history and of the utterances of their own leaders ten years ago, declare that the Irish occupier is part owner of the soil, but it is not likely to conciliate English opponents of the Bill. The agitation which Archbishop Croke is heading, and the ferocious violence now

being displayed at Skibbereen and elsewhere, have added a still more interesting proposition to the curious list of new dogmas which this agitation has produced. It is said, or all but said, that priests are not to be arrested in Ireland. An English clergyman may go to gaol and welcome if he breaks the law for conscience sake; an Irish priest, if he encourages an illegal and criminal agitation in the face of the principles of religion, the doctrines of the Church and the wishes of the Pope, is to be dealt with very tenderly. This last deference to Irish ideas is perhaps the most instructive of all, though it cannot be said to be either illogical or surprising. If what is right in England is wrong in Ireland, it probably follows that what is wrong in England is right in Ireland. Yet the attitude of the Irish is an awkward comment on the speech of Mr. CHAMBERLAIN. The plan, the person, the circumstances, make it almost impossible to suppose that the Government intends to recede from at least so much maintenance of the supremacy of the law as Mr. CHAMBERLAIN advocated. Yet the non-official Radicals grumble at this maintenance, and the Land League regards it with the bitterest hostility. Under these circumstances the task of carrying through a Bill of immense length and complexity must be a very difficult one, and, with anything like factious opposition, would be impossible. Against such opposition the Government are assured, except as concerns the Parnellites and perhaps a few nondescript Conservatives. But, if they are enabled to maintain their present "know-nothing" attitude to avoid remedying some of the grosser and more serious injustices of the Bill, and to persist in refusing compensation even in cases of proved confiscation, their majority will deserve that highest crown which, according to some theologians, awaits, not merely unreasoning faith and obedience, but obedience and faith in the teeth of reason and demonstration.

THE TRANSVAAL.

A CORRESPONDENT of the *Times* who is now visiting South Africa for the first time writes letters which are not perhaps less instructive because they contain the results of recent and unprejudiced inquiry. A resident in any of the South African provinces, though he knows much which a stranger has to learn, can scarcely fail to hold strong opinions or prejudices on all disputed points. The newcomer has the advantage of hearing all sides of the question, while he seeks information both from Sir THEOPHILUS SHEPSTONE and from a Natal colonist who warmly admires Mr. GLADSTONE's policy. It is natural that the eminent public servant who was the principal agent in the annexation of the Transvaal should continue, notwithstanding the disastrous result, to justify his policy. There is no doubt that he acted in good faith on plausible grounds, inasmuch as the President of the Republic and the great body of the community acquiesced at the moment in a transfer of sovereignty which was not supported by any material force. The subsequent ratification of his policy by the Imperial Government relieved Sir THEOPHILUS SHEPSTONE from technical responsibility. The doubts which Lord CARNARVON faintly expressed were cancelled by his formal approval. Nevertheless, it is certain that the decision really rested with the Commissioner on the spot. No servant of the Government had greater experience of South African politics, especially in relation to the natives, of whom he was the official protector; and, in the course of his long and active career, Sir THEOPHILUS SHEPSTONE must on many occasions have had dealings with the Boers in the Transvaal and in the Colonies. One of his motives for annexing the province was probably a desire to put an end to the chronic or frequent wars between the Dutch settlers and the neighbouring tribes. Peace was, in fact, immediately re-established and permanently maintained during the continuance of English rule. No attempt was made by the provincial Government, which represented the Crown, to interfere with the domestic institutions which are not always distinguishable from slavery; but it soon became known to the coloured apprentices that compulsory servitude was not recognized by English law; and probably some of them displayed tendencies to insubordination, while others may have deserted their masters. It is not improbable that the uncertainty which consequently prevailed may have been one of the causes of

the revolt which was so easily successful. A negative reason was the destruction of the Zulu power by English arms, and the subsequent defeat of other native chiefs. All these contingencies ought to have been foreseen, nor is it possible to explain the blindness of an experienced administrator. It is probable that Sir THEOPHILUS SHEPSTONE himself, while he makes the best apologies for his conduct of which circumstances admit, may be conscious that he nevertheless committed a mistake.

There has been no proof that the annexation was in any way produced by the influence of interested persons who knew that the establishment of English dominion would increase the value of their investments; but if the Commissioner had listened to their representations, he might not unreasonably have considered that their arguments were entitled to a certain amount of weight. There is a strong presumption in favour of any administrative system which renders property more valuable. If by some miracle Irish estates became saleable, and even commanded an advanced price, it would be inferred that some beneficial mode of legislation had at last been devised. The denunciations which are now applied to speculative settlers in the Transvaal require to be vigilantly checked. It seems that the Republican Government, among other financial expedients, hit on the plan of issuing *assignats*, or land scrip, purporting to constitute titles to certain lands. They had also a paper currency, which had sunk to the price of two or three shillings in the pound, and both classes of securities were bought by enterprising capitalists, who took the chance of the substitution of a more solvent Government for the President and the Volksraad. It seems to have been agreed on all hands that any change would be for the better, and assuredly the Republican Government, notwithstanding the energy and ability of Mr. BURGERS, afforded small hope of duration. The dominant class of the community carried to excess the wholesome instinct of disliking official interference with their affairs. They were unwilling to pay taxes, and in many instances they avoided service in the Volksraad, with the result of making room for adventurers of doubtful character. There is no doubt that one of the most unpopular results of the annexation was the establishment of a comparatively efficient system of administration. If purchasers of land scrip took advantage of the existence of a regular Government to enforce the rights which they had acquired by purchase, it is difficult to dispute the justice of their pretensions; but the Commission may probably be justified in scrutinizing with jealous attention the amount of the claims to compensation which they will now prefer. If it is true that one applicant asks for 65,000*l.*, the Commissioners may well despair of satisfying the body of claimants. If the incoming Government can be trusted to respect the rights of English subjects, it would be much more desirable to secure the traders and farmers in the enjoyment of their property than to buy them off on the assumption that they will be forcibly dispossessed. Five-and-twenty years ago the English Government, on the abandonment of a protectorate of the Mosquito Coast, compensated adventurers who preferred claims to grants of land by a recognition, but not a guarantee, of their titles. The estates of which President BURGERS and his predecessors may have disposed in the form of scrip are probably not included in the vast private estates which are occupied by the Boers. If the holders of land securities are left to take possession of their properties, they will probably in many cases practically relinquish their claims.

The question which seems to form the most difficult part of the task of the Commission relates to the detachment from the Transvaal of a portion of its eastern territory. The object is to exclude a large native population from the unwelcome dominion of the Boers. It is also thought desirable to interpose a barrier between Zululand and the Transvaal. It is supposed that JOHN DUNN expresses the apprehensions of the other Zulu chiefs when he insists that either their country shall be separated from the Transvaal or the arms of which they were some time since deprived shall be restored. The English Commissioners and the Government will not fail to observe that they are asked for the benefit of the natives to incur a responsibility, even if the Boers consent to the division of territory. The Crown, retaining the sovereignty of the native territory bordering the Transvaal on the east, will be held responsible for any hostile move-

points on the part of the tribes. In some not unlikely events, the local authorities will have to choose between war with the Swazies and war with the Boers, although no English interest might be involved. Before the annexation and the Zulu war the Colonial Governments occupied a safer and more convenient position. They were on friendly terms with the Zulu King, whom they restrained by their counsels from the attack which he habitually meditated on the Transvaal. If their influence had proved insufficient for the maintenance of peace, they had the option of neutrality or of dictating the terms on which they might have accorded protection to the Boers. It has often been explained that the Zulu war would never have occurred but for the annexation of the Transvaal. The question is now complicated by the responsibility which may have been incurred in consequence of the disintegration of the Zulu kingdom and of the disarmament of the soldiery; but it will be expedient to limit as narrowly as possible any fresh obligations which may be assumed. The protection of the natives within the limits of the restored Republic will be still more embarrassing or impracticable. A Resident who would have no military force at his disposal might remonstrate in vain against the breach of undertakings which might have been given for the security of the natives against oppression. There is little use in any attempt to disguise a surrender of which the circumstances and motives are thoroughly understood in all parts of South Africa. The thin fiction of suzerainty is scarcely worth preserving when it imposes duties which there may perhaps be no means of discharging, while it confers no corresponding rights. If it is true that the negotiators on behalf of the Boers now display moderation and good will, their less pugnacious attitude may probably be explained by their knowledge that they have obtained in substance all the concessions which they require.

KINGS AND PRINCES OF THE DANUBE.

THE establishment of the Kingdom of Roumania has received, as the Roumanians say with legitimate pride, the sympathetic welcome of all Europe. The King has made himself agreeable to his powerful neighbours, and popular with his admiring subjects. A new Ministry has come in with the new reign, and has solemnly laid its programme before the Chamber. M. DEMETRIUS BRATIANO is the Prime Minister, and his Ministerial statement, unlike most Ministerial statements, had much in it that was new and striking. He drew a picture of the Roumanians for their own benefit and study. He showed them what they were and what they might be, and, while he owned that there were some dark spots on his canvas which he was too honest to obliterate, he had the merit of not despairing of his country. He had thought of something quite original, which he commended to their notice, and, although he anticipated an outburst of incredulity, he thought that he could show them that he was right. The novelty which he had happily struck out was the notion of being honest. He announced that he was going to be honest, that he was going to work with honest men, and that his Parliamentary course would be always straightforward. He had been told, he said, that this would never do. Such things were not suited to Roumania, and were in the Roumanian nature of things impossible. But he was not to be discouraged. He personally could not carry his scepticism so far as to believe that there were no honest men in Roumania, but he was ready to look the worst in the face. "Let us suppose," he said, "that there are no 'honest men' in Roumania. Well, if that is so, we will 'make them.'" The PRIME MINISTER contemplated with calmness the possibility that he was living in a country and addressing a Chamber in which every man was a rogue, and he thought that if he did but sow a few honest men they would come up like cabbages. The same dismal people who had warned him that there were no honest men in Roumania had also warned him that he must turn and twist in his management of Parliament. It was of the essence of Parliamentary institutions, they insisted, that Ministers should always go zigzag, and the notion of a Minister walking straight was contrary to the most elementary rules of the game. He, however, was going to make the bold attempt to avoid all tortuous courses, and he was sure that in the long run he would

have the approbation of the country. At any rate, he would have the approbation of his honest men when they had come up. On other points he was vague, merely saying that, if any one touched his dear Roumania, he would defend it with the fury of a tigress defending her cubs. To such sentiments the Roumanians are well accustomed. Every Minister in turn offers himself as a possible tigress if Roumania is attacked. But a Prime Minister offering to invent honesty in his country, if it did not exist, is now, not only to Roumania, but to the world. If it showed what Roumania is really like, it also showed that, with the faults of political childishness, Roumanians have that childish simplicity which resents nothing and pretends to nothing. They are, at least, free from political hypocrisy. The youngest of constitutional kingdoms starts, and consciously starts, at the very lowest stage of political virtue. As it can scarcely go down, it may be right in thinking that it must go up. Nothing is so puzzling as to know when nations are fit for constitutional government. Possibly Roumania may prove that fitness begins when the nation has pondered over its own qualities and has recognized that, so far as honesty goes, it is totally unfit.

The Prince of BULGARIA has had practically to think over the puzzle of fitness for free government, and has come to the conclusion that the two millions of poor ignorant sordid peasants who were handed over to his care by the Great Powers are totally unfit. If he is to be allowed to govern in his own way, then he will stay in Bulgaria, and this people shall have all the advantages that may accrue from a Hessian prince keeping a little court at Sofia. If the Bulgarians prefer their Constitution to their Prince, he will go away, and will not think the day an unlucky one when he wipes the dust of Bulgaria off his feet. It can scarcely be said that the mere placing of this alternative before the Bulgarians is dishonest. He swore to the Constitution as it stands, but to abdicate would not be to break his oath; and if he prefers abdication to governing with a Constitution which he declares will not work, he may not improperly ask whether the nation would prefer to see him abdicate or to change the Constitution. Practically, however, it is almost impossible that a prince should leave such a question to the free choice of the people. Prince ALEXANDER has already solved the question temporarily, if not definitely, his own way. He has suspended the Constitution while the Bulgarians are being asked whether it shall exist. He has put himself in the hands of a Russian General who manages everything as a Russian and a General likes to manage them. A Convention is to be called together to declare the mind of the nation, but the PRINCE and his friends make no secret of the very great pains they are taking to influence the elections, by which the members of the Convention are to be appointed. The proceedings of the PRINCE are in the nature of a *coup d'état*, although not of a *coup d'état* of the worst kind. He has so far improved on former precedents that he has not begun with the traditional whiff of grapeshot. But not the less he only pretends to ask a fair question, for he is doing all he can to ensure that the answer shall be what he wishes it to be. What has really happened in Bulgaria since the PRINCE arrived there is altogether obscure. But it may be safely said that nothing has happened which could not have been foreseen. There has not been the faintest approach to revolution or armed resistance. Every Bulgarian has been happier than any Irishman is now. Members of political parties have been stupid and unpractical, but no one in his senses could have expected that members of Bulgarian parties would be anything else. The Bulgarian peasants have no doubt some virtues, for without some virtues no people could exist; but their general character was amply illustrated during the war by their behaviour, not only to their Turkish enemies, but to their Russian friends. The probability is that they are not fit for the Constitution that was given them, but of all men in the world Prince ALEXANDER was the most bound to weigh this probability well before he went among them as the head of a free people.

Prince MILAN of Servia has been making one of those tours to great Courts which princes of his class have lately got into the habit of making. He has been to Vienna; he is at Berlin; he is going to St. Petersburg. It is understood that his object in these solemn calls on his superiors is to turn himself from a prince into a king. He had perhaps better go to Paris under pretence

of buying a snuff-box, for this might conciliate M. ST. HILAIRE, imitation being the most adroit kind of flattery. His plea is that he now rules over an independent State, and that Servia is as much entitled to have a king as Roumania or Greece. He has 1,800,000 subjects, mostly pig-drivers, and although this does not sound very grand, he may justly say that he has as many subjects as the King of Greece has, and that if the Greeks got ready for fighting, his people actually fought. He has, too, the special merit of not being a foreigner in his own country, and the Servians may justly plume themselves on having produced a king who is a Servian. So far as any political importance can be attached to the erection of Servia into a kingdom, it may be said to be a slight gain, and no loss, to Europe that Prince MILAN should be a king. That no difficulty should have been made at Vienna to the creation of a Servian kingdom is quite in keeping with the recent policy of Austria, but quite out of keeping with the supposition that Austria wants to swallow up one portion after another of the Balkan peninsula. That this supposition is totally erroneous must be evident to any one who is acquainted with the relations of Austria and Hungary. The Hungarians are extremely averse to the incorporation of more Slavs in the Austrian Empire; but they have a jealous dread of Russian influence among the Eastern Slavs, and they are perfectly alive to the material advantages which they themselves would derive from the development of commercial intercourse with the nationalities south of the Danube. Roumania, Bulgaria, and Servia cannot stand alone. At the best they can only play off one Great Power against another; and, although they may not become Austrian, they may very probably become as much Austrian as Russian, and that they should become so is, at least for the present, the best guarantee of their independence.

THE INDEMNITY TO AMERICAN FISHERMEN.

THE American Secretary of State, Mr. BLAINE, enjoys good fortune both at home and abroad. He has provoked his rival, Mr. CONKLING, to commit a kind of political suicide, and he has recovered a pecuniary penalty from the English Government. The payment of 15,000*l.* will not be ruinous, and it may possibly be just; but it is a strange circumstance that the present Ministry should end all disputes with foreign countries by acknowledging itself to be in the wrong. In the present instance Mr. GLADSTONE's former Administration is exclusively responsible for the petty humiliation which has been incurred. The so-called Plenipotentiaries at Washington are believed to have acted under stringent and repeated orders in their profuse and hasty concessions. Probably, if they had been allowed a discretion, Lord RIFON and SIR STAFFORD NORTHCOKE might have successfully insisted on framing the treaty so as to render impossible the profligate demand which was afterwards known as the indirect claims. The American negotiators might also have been persuaded or shamed into an agreement that the damages to be received by their Government on behalf of private claimants should not exceed the amount which they might themselves afterwards award. The Americans were more anxious for a diplomatic triumph than for profit; and Mr. GLADSTONE and his Cabinet thought, as in a more recent case, that the adversary whom they feared would be most effectually compelled by unqualified surrender. The iniquitous judgment of the Geneva arbitrators was, perhaps, welcomed as an unexpected confirmation of the American victory. The spirit in which the English concessions were received was illustrated by the subsequent hesitation of the American Government in paying the comparatively small amount which under the treaty was awarded as compensation to the Dominion of Canada. It must be confessed that after the two arbitrations the English Government displayed more dignity and self-respect than the rapacious litigants who protested against the decision of a tribunal appointed by themselves.

The petty fine of 15,000*l.* is another result of the timid precipitation with which the Treaty of Washington was concluded. The admission of American citizens to fish in colonial waters may, perhaps, have been expedient and reasonable; but no class of the community is more jealous of its own rights, or more habitually inclined to encroach on the property of its neighbours, than the hardy seamen who are engaged in the fishing trade. At the present

moment the English Government is called upon to protect the North Sea fishermen from the violence of French, Dutch, and Belgian rivals. It was certain that the people of Newfoundland would regard foreign competitors with jealousy, and that American fishermen would not be inclined to assert their newly-established claims with considerate moderation. The conditions and regulations under which the colonial fisheries were to be opened ought to have been carefully examined and plainly defined; and the most obvious stipulation of the treaty ought to have been that aliens should not be allowed any advantage over the natives with whom they were to compete. As in other parts of the negotiation, it was the interest of the American Plenipotentiaries to use vague and elastic phrases; and their English colleagues were on all occasions complaisant enough to play into their hands. Both parties ought to have been aware, and one of them probably remembered, that, when the treaty came to be interpreted, the more obstinate and more litigious disputant would be likely to succeed. Accordingly American fishermen obtained in general terms the right to fish on the coasts of Canada and of Newfoundland, and also to use the shores for certain specified purposes. Some time afterwards a fleet of American fishing-boats appeared at Fortune Bay in Newfoundland, and proceeded unconsciously to illustrate the culpable negligence of the English framers of the Washington Treaty.

The law of Newfoundland, by which the colonial fishermen were bound, prohibited the use of seines in certain circumstances, established a close time, and made it unlawful to fish on Sundays. The newcomers unhesitatingly disregarded all the restrictions, and prosecuted their calling in such a manner as to threaten ruin to native enterprise. They put out seines, they fished on Sundays, and it is asserted that they would, in default of interference, have destroyed the fishery. It is more certain that they claimed or exercised an advantage which must have been absolutely intolerable to the people of Newfoundland. Accordingly the local fishermen took the law, as might have been expected, into their own hands by removing or injuring the nets, and possibly in some instances by assaulting the unwelcome intruders. Compelled to yield to superior force, the Americans naturally appealed to their own Government, which is always glad of a ground of complaint against England. There is happily at present no risk of war or of serious embarrassment; but American Presidents and Secretaries of State know that their popularity is always increased by unhesitating adoption of the claims of American citizens, and by vigorous despatches written with a view to domestic circulation. Mr. EVARTS may perhaps have been justified in his demand for pecuniary compensation to the fishermen who had been driven from Fortune Bay. In Newfoundland, as elsewhere, private persons who are injured ought to seek legal redress, and not to assert their rights by force. If the officers of the colonial Government had prevented the American fishermen from continuing their questionable practices, the issue of international law would have been raised in a more convenient form. Wrongdoers, indeed, may be forcibly prevented from persevering in a trespass; but, according to the legal phrase, the injured person must lay hands gently on the trespasser; and it is highly probable that a body of indignant fishermen may have used more than the necessary force. Lord SALISBURY in the early part of the correspondence contended that, as in his judgment the American fishermen were trespassers, they were not entitled to compensation. Lord GRANVILLE afterwards agreed to pay compensation for the excess of force, which the Newfoundland fishermen may probably have employed. He has the qualified satisfaction of having reduced by one-fourth a demand for 20,000*l.*; and Mr. BLAINE agreed to give a receipt in full for certain petty demands which had been accumulating in the Secretary of State's office. The main controversy is nevertheless still unsettled.

Mr. EVARTS, with much force of language, and with a certain amount of plausibility, argued that an international engagement could not be overridden by municipal legislation. The American fishermen were by the treaty admitted absolutely to the right of fishing in Fortune Bay and other parts of the colonies; and, therefore, they might pursue their industry by all conceivable methods and at all times and seasons, even if their conduct tended to destroy the fishery or gave them an invidious preference to the natives whom they superseded. The only remedy

for the injured party was diplomatic remonstrance, which, as Mr. EVARTS well knew, would have been unavailing, unless the English Government were prepared to pay an additional fine for a new concession. If Mr. EVARTS was in the right, it would be impossible to produce a stronger illustration of the scandalous neglect of those who are responsible for the Washington Treaty. It was assuredly not the avowed intention of either party that the Americans should obtain, not an equal enjoyment, but a monopoly of colonial fisheries. Lord SALISBURY maintained that the document must receive an interpretation not wholly repugnant to common sense. He had no occasion to dispute the proposition that treaties could not be restricted by subsequent municipal enactments; but it is obvious that freedom of trade accorded to a foreigner means the freedom already possessed by native subjects or citizens. It is not the custom of American Governments to withdraw even the most extravagant pretensions; and Mr. BLAINE adheres to the doctrine of his predecessor. Lord GRANVILLE, with better reason, repeats the arguments of Lord SALISBURY; and neither party is likely to give way. Probably the dispute will sooner or later be settled by an admission of the English claim made in return for a concession in some other matters. It is difficult to regard with perfect calm the injustice of the American pretension. If foreigners, having previously been excluded from the right of keeping public-houses in England, were by treaty admitted to the privilege, they might, according to Mr. EVARTS and Mr. BLAINE, supply drink to customers till three or four in the morning. If they were similarly allowed for the first time to shoot game, they would be entitled to kill grouse in July, partridges in August, and pheasants in September. It would be easy to multiply illustrations of the monstrous perversity of the American contention. The English Plenipotentiaries at Washington or their Government ought to have appreciated the audacity of the diplomatists with whom they had to deal.

LORD DERBY ON CO-OPERATION.

LORD DERBY spent his Whit Monday in a highly characteristic fashion. He is probably very much of Sir GEORGE LEWIS's opinion about the relation of amusements to life, and regards a holiday passed in a Co-operative Congress as a holiday snatched from the burning. The address he delivered to the delegates was full of sound sense and useful suggestions. It is allowable on occasions of this kind to take an optimistic view of the prospects of co-operation, and no one knows better than Lord DERBY that, though he told the Congress nothing but the truth, it was not quite the whole truth. It is far from certain, however, that any good purpose would have been served by more complete frankness. When it is very desirable that certain undertakings should be set on foot, those who make the attempt may sometimes be left to find out for themselves that they can only hope for partial success. That is the best that can ever be hoped for in any human undertaking; but if this were clearly realized beforehand, it might end in many cases in the attempt never being made.

It is some comfort to hear from Lord DERBY, who is a very shrewd observer of social currents, that we are more and more adopting the doctrine that "many matters which of old it was thought essential that the governing power should regulate, may with safety and advantage be left to the community." As he admits that there are superficial appearances to the contrary, it is plain that he has formed his opinion after a fair study of the evidence which facts afford, and we are glad to have such competent testimony to a conclusion which we ourselves should have thought doubtful. There can be no question, however, of its truth as applied to the Co-operative movement. That, at all events, "does not clamour for public money; does not ask that its opponents should be put down by law; does not override free contract or meddle with individual liberties. The only appeal either to the Legislature or the Executive which has been evoked during its progress is the demand of certain tradesmen that Civil servants shall be excluded from its benefits. Lord DERBY was careful to show that the success of the Co-operative movement owes as little to morality as it does to law. He does not claim for co-operators that they are unselfish; the great merit of the movement is that it

makes selfishness amiable. Interest and duty are on the same side; the more you consult the one the better you do the other. If Lord DERBY had been speaking to a London meeting this statement would have stood in need of qualification. The Co-operative Societies with which Londoners are most familiar are not exclusively, probably not principally, Co-operative Societies in the true sense. Lord DERBY recognizes the distinction, but he does not point out how incompletely the objects aimed at by Co-operation are attained by these imitators. The first point of the Co-operative charter, he says, is "No adulteration," the second, "No running into debt." When a joint-stock Company is started for the purpose of supplying subscribers as well as shareholders with goods, there is a perfect security against debt, but there is not a perfect security against the supply of adulterated or inferior goods. So long as shareholders alone are allowed to deal at the Store, the seller and the buyer are one and the same person. But as soon as subscribers who do not share in the profits are allowed to come in as buyers, the seller and the buyer become different persons and have different interests. The seller is now anxious to make as much as he can out of the buyer, because the more he is able to make in this way the larger will be the profit on his capital. He cannot make much by raising prices, because, if these are not conspicuously lower than those of other dealers, there will be no inducement to buy at the Store rather than elsewhere. Consequently, the only way in which the profits can be increased is by lowering the quality of the goods. We do not mean, of course, that this is done by any of the respectable Co-operative Societies in London, any more than it is done by any really respectable shopkeeper. All we wish to point out is that a Co-operative Store in which the buyers have no share in the profits provides no security against adulteration different in kind from those provided by private dealers. Such a Store is simply a joint-stock general shop, and its reputation for fair dealing will in the long run depend, just as in the case of a private general shop, upon the characters of those engaged in carrying it on. Where the profits, after the payment of interest on capital advanced, are divided among the buyers in proportion to their purchases, there is an absolute protection against adulteration. The buyers of the goods take the profits derived from the sale of them, and consequently they are sellers as well as buyers.

In dealing with productive Co-operation Lord DERBY made the mistake of underrating, or rather ignoring, the pleasure which a good workman takes in his work. No doubt excessive subdivision of labour and trade-unions have done their utmost to destroy this pleasure; but in really good workmen it is, we suspect, indestructible. It is not, and is not likely to become, universally true that the man employed by the hour cares to do more than is required to secure himself from dismissal. But, though Lord DERBY is wrong in assuming that, unless a man is working for himself, his work will in all cases be either slow or scamped, it is quite true that this will be the case with a vast number of workmen, and that the multiplication of securities against this risk is a very great gain to the community. Nor does Lord DERBY see very much force in the argument—so commonly used against productive Co-operation—that the principle of division of profits must break down when there are no profits to be divided. What will then happen is that the Co-operative workman will have to live on his savings until times grow better. But this is exactly what happens to a man who lives by wages. When his master fails, or closes his works, "he loses his employment, and in a dull state of trade he may not possibly find another." Consequently workmen engaged in Co-operative production must keep two cautions steadily in view. They must put by a certain proportion of their profits before division to enable the concern to go on while trade is slack, and they must put by a certain proportion of their profits after division to enable them to live if, after all, the concern should not be able to go on. Every workman, if he is prudent, takes this latter precaution in his character as workman; and if he becomes a capitalist as well as a workman, he must take the former precaution in his character as capitalist. Difficult as it may be to make arrangements of this kind on a sufficiently large scale, Lord DERBY is in the right when he says that no labour is thrown away which brings society any nearer to a settlement of the most inveterate of conflicts. "The industrial difficulty is growing

"into continually larger proportions . . . the difference "between the relative position of employer and employed "tends to widen, not to diminish." Arbitration will not settle matters, because arbitration is only applicable when the parties to the dispute are already half way to an understanding. Trade-Unionism at best helps to equalize the resources of the combatants; but even this function it can never, in Lord DERBY's opinion, discharge completely. Not only will the employer always be able to hold out longer than the employed, but "the article which the "working-man has to sell is one which, in the very nature "of things, will not keep. . . . If he cannot sell to-day's "labour at the beginning of the day, he cannot sell it "at all. That portion of his stock has perished." So far it might seem that it is only the workman who is concerned in promoting Co-operation, and if the matter were only looked at from the social side, this would be true. If it is the workman who will be beaten if the struggle goes on, it is the workman's interest to bring it to an end. But there is a political side to the question as well as a social one. "Given the condition that nearly "all political power is virtually in one class, as under a "system of household suffrage it is whenever the class "chooses to take it, and nearly all the surplus which men "desire to possess is in the hands of another class, how "long will you be able to avert an explosion?" Co-operation does not supply an answer to this inquiry, but it tends to modify the condition which suggests it by distributing part of the surplus wealth among the class that has the political power, and it is this consideration above all others that leads Lord DERBY to advocate it "as one of "the most hopeful signs of our times."

THE SPOILS OF THE TURKS.

THE States which have been formed out of the decaying Turkish Empire are perhaps gradually settling down into their permanent condition; and it is not surprising that in the meantime they should be subject to various forms of political excitement. Prince MILAN of Serbia is visiting some of the Continental Courts in the hope that he may be recognized as King instead of Prince, after the example of his neighbour of Roumania. His request will probably be granted, though it oddly happens that he has once assumed the royal title, and afterwards tacitly dropped it. He and his countrymen had the questionable merit of beginning, at the instigation of Russia, the unprovoked attack which was the first step to the long meditated dismemberment of Turkey. After some trivial successes Prince MILAN induced his army to salute him as King, but shortly afterwards his State was only rescued from destruction by the peremptory interference of his Imperial abettor and patron. At the end of the Russian war Serbia received a small addition of territory; but the prospect of further aggrandizement was destroyed by the Austrian occupation of Bosnia. The proposed titular change is not absolutely unmeaning. It may perhaps not be agreeable to the Royal families of Europe to admit new claimants to their exclusive rank; but the kingly title is understood to imply complete independence. NAPOLEON created two or three kings within the limits of the old German Empire; and, after his fall, the Elector of Hanover asserted his claim to an equal rank with his neighbour of Saxony and Wurtemberg. Not many years afterwards Belgium was added to the list, and Greece had the good fortune to receive the same dignity. A petty kingdom seems to acquire a kind of claim to the diminution of the contrast between its rank and its material importance. In one remarkable instance, the acquisition of the royal title has contributed to the gradual creation of a great Empire. The Elector of Brandenburg obtained the consent of the Emperor to his assumption of the title of King of Prussia in the first year of the eighteenth century. His contemporaries were amused by his vanity; and even so sagacious a historian as CARLYLE falls into the error of ridiculing the coronation of FREDERICK I.; yet it was to support the kingly dignity that his son, FREDERICK WILLIAM I., organized the formidable army with which FREDERICK created a powerful monarchy, destined under WILLIAM I. and Prince BISMARCK to expand into the German Empire. To compare small things with great, a King of Serbia may possibly find himself stronger through elevation to the higher rank. Prince MILAN may perhaps also think

that as king he will be more secure from the competition of the rival dynasty which descends from KARA GEORGES.

Prince ALEXANDER of Bulgaria will almost certainly prefer a similar demand if he succeeds in his contest with the champions of the existing Constitution. Few Englishmen are sufficiently familiar with Bulgarian politics to share the confidence with which Mr. GLADSTONE is perhaps entitled to form the judgment on the controversy which is expressed in his letter to Mr. ZANKOFF. According to his opponents, Prince ALEXANDER is a conspirator and a usurper; and it is certainly not an argument in his favour that his present policy is countenanced or suggested by Russia. On the other hand, it is more than probable that an Assembly elected by universal suffrage is utterly incompetent to exercise supreme power in such a country as Bulgaria. When Lord PALMERSTON was, after the overthrow of the French Republic in 1852, accused of disrespect to constitutional liberty, he replied that he fully appreciated historical freedom, but that he cared nothing for the Constitution, which he irreverently designated as "the tomfoolery of MARRAST and TOCQUEVILLE." It is not improbable that the democratic institutions which were two or three years ago conferred on Bulgaria by the most absolute despot in Europe may deserve at least as well the character of tomfoolery. The PRINCE, according to his public professions, offers his subjects the alternative of enlarging his powers or of losing his services. If the General Assembly to which he appeals supports his demands, or if, in the event of failure, he resigns his uncomfortable post, a provisional suspension of some of the provisions of the Constitution will not necessarily deserve to be regarded as a crime. Some of those who know the circumstances of the case believe that Prince ALEXANDER would prefer abdication to continued absence from civilized society. If the Assembly succeeds in maintaining a purely democratic Government, and if the PRINCE consequently resigns, his successor will not be an object of envy. According to some reports, a brother of the King of GREECE, of the Princess of WALES, and of the Empress of RUSSIA, will be invited to fill the supposed vacancy. Like Coburg in the last generation, Copenhagen seems likely to become an *officina regum*.

The Greeks, who are the most fortunate of all the sharers of Turkish spoils, are, if those who speak in their name may be trusted, the most profoundly discontented. To the Powers who procured for them the peaceable possession of the rich province of Thessaly they not only refuse any expression of gratitude, but they loudly profess resentment and indignation. It is true that the supposed feeling of disappointment is most loudly proclaimed by the organs of the Opposition, which may, perhaps, succeed to office if its denunciations of a feeble or treacherous Ministry are generally accepted. While the settlement of the dispute was still uncertain Mr. COUMOUNDOUKOS and his colleagues repeatedly declared that acquiescence in the requirements of the Great Powers would be followed by popular explosions, and even by the overthrow of the dynasty. The army was supposed to be overflowing with military ardour, and the whole community with self-sacrificing patriotism. It was difficult to believe that a shrewd and calculating nation could be so foolish as to prefer a more than doubtful war for two provinces to the acquisition by diplomatic methods of one which is also the more valuable. There was no reason to suppose that the Greek levies would drive the seasoned Turkish troops out of Thessaly; and in Epirus an invader would also have had to count with the warlike inhabitants of the disputed districts. The only title of the Greeks to either Thessaly or Epirus was the unauthorized and imprudent award of the Conference of Berlin in an issue which had never been submitted to its decision. The blunder into which the English and French Governments led the other Powers has since been corrected by a virtual revocation of the decree. If the Turks ought to have been bound by the award of Berlin, it is evident that the more recent decision of the Powers must be still more conclusive. It is highly probable that, in spite of the strong language which is used, the Greek Government and people are well contented with their extraordinary good fortune. They may have been misled for a time by the statesmanlike encouragement which they received from their officious partisans in England; and they were justified in attaching importance to the capricious encouragement which they at one time received from the French Government; but no intelligent Greek could con-

template with equanimity the prospect of an unequal war. The modern doctrine of ethnological affinity is less absurd in its application to Greece than in almost all the other cases in which it serves as a pretext for ambitious claims. It is highly desirable that the Greek population in Thessaly should be emancipated from Turkish rule and annexed to its kindred in Boeotia and Attica; but the sympathies of race and language form at the best but an uncertain foundation for political arrangements. Either spontaneously, or perhaps in consequence of foreign intrigues, the Wallachians who occupy some parts of Thessaly have suddenly discovered that they are wronged by their proposed subjection to the Greek Government. As they must be too insignificant in numbers for independence, and as they could not conveniently be annexed to the distant Roumanian kingdom, it is difficult to understand why they should prefer the Turks to the Greeks. It is not likely that the insurrection which is threatened on their behalf will have any result, except, perhaps, to accelerate the transfer of territory; but the Greek Government may advantageously reflect on the difficulties which it will have escaped through the intervention of the Great Powers. Cavils at the terms of the Convention are imprudent as well as injurious. Perhaps they will cease when the new province is finally occupied.

INDUSTRIAL SCHOOLS.

A GOOD deal of somewhat desultory discussion has lately been going on as to the distinction between reformatory and industrial schools. At present the line of demarcation between them is not very clearly drawn, and, in the opinion of some of those who have taken part in the controversy, it might well be effaced altogether. Upon the intentions or construction of the existing law we do not propose to touch; but something may usefully be said upon the larger question whether there is, in the nature of things, any real difference between the two institutions and between the classes of children for whom they are respectively fitted.

If society were what it ought to be there would be no place for industrial schools. Children not convicted of crime would be under the care and control of their parents until they passed under the care and control of an employer, or became their own masters. The law would in no way concern itself with them. There would be no need to consider how they were to be disposed of until the actual plunge into crime had been taken. Then it would be essential to devise some method of punishment which should be reformatory as well as deterrent. It is well, of course, that both elements should enter into all punishments; but in dealing with children the reformatory element ought to have far greater prominence given to it than in the case of adult offenders. There is far more chance that reformation will be effected; and, with life before them, it is proportionately important that it should be effected. Consequently offences which would be properly punished in an adult by a short term of imprisonment are properly punished in children by a long term of confinement in a reformatory. Indeed, it is of no use to send them there except for long periods. A short imprisonment may be deterrent provided that it is made unpleasant enough; but when a child has to be weaned from evil ways and bad associates, the enforced severance from them must be long as well as complete. Unfortunately, society is not at present, or soon likely to be, in that millennial state in which every man who is not a criminal is able and willing to do his duty by his children. There are parents who are too careless of their children's good to exert any control over them; there are parents who, with the best intentions, seem to find their children hopelessly unruly. When the child ought to be at school or at work, he is wandering in the streets, with an evident desire to have a hand in any mischief that is going on. He is not, as his father occasionally informs a policeman or a school visitor, a bad boy—that is to say, he has done nothing, and very possibly does not wish to do anything, that can properly be called criminal. But it is very clear that he is on the high road to becoming a very bad boy indeed; that a year or two more of neglect at home and evil communications abroad will almost certainly bring him into conflict with the law; and that, once made acquainted with a prison, it is exceedingly likely that he will find his

way thither again. What is to be done in such a case as this? To leave things to take their course is needlessly to increase the amount of crime that there is in the world. To send the boy to a reformatory is to destroy the sense which up to this time he has retained of being superior to such of his companions as have fallen into actual crime. An industrial school exactly meets the need. The boy has as good a chance of turning out well if he is sent to one as he would have had at home under a stricter father, or with a more manageable disposition. He does not go there to be punished, but to be brought under proper training. It will be no disgrace to him in after life that he has been brought up at an industrial school, any more than it is a disgrace to a high-spirited girl that she has been brought up at a boarding-school because she was too much for her governess. The fact only testifies to an amount of daring and independence which, if turned to good account, may be of real service to their possessor. All that is necessary to industrial schools taking this rank in popular estimation is that they shall have no shadow of connexion with reformatory schools. It must be clearly understood that each school has its own specific character and place in the world; that they are meant for different classes of children; and that, though the inmate of an industrial school may by misconduct qualify himself for a reformatory school, the inmate of a reformatory school can never pass into an industrial school. More than this, it must be understood that a conviction for any crime, however small, operates as an absolute barrier against admission into an industrial school, and that no boy who has not been convicted of crime can ever be sent to a reformatory school. The two institutions cannot be made to do one another's work without becoming incapable of doing their own. If a boy who ought to be at a reformatory school is sent to an industrial school, he will almost certainly corrupt the boys he finds there. If a boy who ought to be at an industrial school is sent to a reformatory school, he will almost certainly be corrupted by the boys he finds there.

Of course there is a very real danger in all this. If unruly boys are sent as a matter of course to industrial schools, what is to prevent parents who wish to be relieved of the burden of their children from taking pains to make them unruly? The parent who does not do his duty by his child will be distinctly better off than the parent who does do his duty by him. The one will have his children brought up at the expense of the community, while the other will have to bring them up at his own expense. But real and great as this danger is, it admits of being entirely averted. In the first place it must be remembered that men and women who are very bad parents in a moral sense may be, and often are, very good parents in an emotional sense. They may not be able to control their children, but they are just as fond of them as though they were the best disciplinarians in the world. The last thing that a father or mother of this type will wish for is to be separated from their children for some years. They would rather that they played about in the streets all day, and came home at night when the working hours are over and the parent is able to enjoy his children's company. This is the consideration that makes the plan of day industrial schools so mischievous. A day industrial school takes away the child during the hours when the most affectionate parent is glad to have him away, and returns him for the hours when even an ordinarily affectionate parent is glad to have him at home. Industrial boarding-schools are free from this objection. When a child goes to one he leaves home altogether. In the second place, a parent whose child is placed in an industrial school loses the value of his labour. There are no weekly wages to be brought home. If the child is able to earn any money, it goes to the funds of the school of which he is an inmate. To a poor family this is sometimes a serious consideration. The withdrawal of one month is nothing like a compensation for the withdrawal of one pair of hands. In the third place, in any well-ordered system of industrial schools the parent will be made to contribute towards the maintenance of his child. As is very well pointed out by Mr. Watson, the Honorary Secretary to the Industrial Schools' frigate *Havannah*, in a letter in the *Standard* of Thursday, the Industrial School, though it is not meant to punish the child, is meant to punish the parent. He is in fault because he has not brought up his child properly, and when this neglect of his becomes patent, and is obviously bringing the child to ruin and

preparing him to be an injury to the State, the State steps in and punishes the parent by taking the child away without taking away the burden of supporting him. Thus there are three considerations always at work to induce a parent to bring up his children properly. If he fails to do so he will be separated from them when otherwise he would have them with him; he will lose their wages, when otherwise he would have the benefit of them; and, in addition to this, he will be obliged to give hard money for their support. A properly organized system of industrial schools does not tempt parents to neglect their children; it rather makes it their interest to take care of them. It appeals alike to their affections and their pockets by holding out to them the unpleasant prospect of having both hurt.

RUSSIA.

OF all the countries that play a leading part in human affairs, Russia is, after China, that of which foreigners know least. It is only in the broadest and most general way that we can speak of anything Russian, and we can never be sure that such information as it is possible to obtain about Russia is not exaggerated or false or irrelevant. All that can be done is to seize on passing indications of what we may suppose is happening or is likely to happen in Russia, and to take them for what they may be worth. In Russia the CZAR is everything, and the CZAR must have some sort of domestic policy, and some sort of foreign policy. To learn a little as to how the CZAR personally is living, enjoying himself or suffering, and to catch a faint clue to his domestic and foreign policy, is the most that can be aimed at. Unless the accounts that reach England are mere fiction, the CZAR is at this moment leading, perhaps, the most wretched life that any human being is called on to endure. He is a prisoner at Gatchina, and a most unhappy prisoner. No one is allowed to go near him except after the most elaborate precautions have been taken. Every person, however well known, is watched, inspected, and searched; Cossack sentinels with drawn swords tramp up and down, and are stationed at the doors of the bedrooms of the Imperial family. The poor little heir to the throne is not allowed to take his usual exercise; he cannot ride in the park adjoining his father's house; and, in short, the whole of the Imperial family lead very much the same life as was led by Louis XVI. and his family after they became the prisoners of the Jacobins. And yet, in spite of all precautions, the audacity of the enemies of the CZAR never flags, and their pertinacity is never relaxed. It is said that at the station of Gatchina itself a mass of dynamite has been discovered, which was connected with the electric system of the telegraph office. The telegraph officials have been arrested, and have been added to the long list of officials in the close neighbourhood of or in familiar contact with the CZAR who have been reasonably or unreasonably suspected. Officers of the navy and officers of the army have been discovered to be connected with revolutionary plots, and the schemes of minor villains are always coming to the surface, and reveal something like a mania for harassing, if not killing, the CZAR. The members of the Central Revolutionary Committee, whoever they may be, have been good enough to intimate, through one of those indirect channels which they seem always easily to command, that they have not given orders for the death of the CZAR. They are willing to give him a fair amount of time in which he may show whether he is worthy to reign or not. But they have not the power, and perhaps not the wish, to keep back less responsible and more ardent conspirators. The police, who are now inspired by an activity unknown in the time of the late CZAR, are continually coming upon batches of persons, most of whom are women or mere lads, engaged in the most dreadful designs on the safety of the CZAR. The discoveries of a police stirred to unwonted activity at a time of feverish excitement are always to be received with distrust. As a rule, it may be said that the police under a despotism invent quite as many plots as they discover. But it is impossible to set down all the discoveries of the Russian police as imaginary. It cannot be for nothing that the CZAR shuts himself up at Gatchina like a hunted animal in his lair. No one would lead the miserable life led by the most

powerful of sovereigns unless he were absolutely obliged to lead it.

Apart from his prison life, the CZAR is as much a CZAR as any CZAR ever was. He can count as fully as any of his predecessors on the army, the clergy, and the peasants, and his domestic policy seems to consist in asserting himself as CZAR. He has thrown himself into the arms of those who represent old as opposed to new Russia. IGNAZIEFF replaces MELIKOFF, and General MILUTIN has been relieved from his post as chief organizer of the army. The press is silenced, but an exception is made in favour of the organs of what is known as the extreme Moscow party. The CZAR is once more a Moscovite CZAR. He throws himself on the support of those on whose loyalty he can most confidently reckon. There is not the remotest chance of a real revolution in Russia, and the CZAR, with the mass of his people, is pitted against his personal enemies. They are his enemies not because they hate him, but because they wish for changes more or less radical in the Government of Russia. When he came to the throne the CZAR had his choice either of trying to crush the revolutionists, or of disarming them by making changes that would win him temporary popularity. At first he seemed to lean towards the latter course; but he soon changed his mind, and determined that he would fight the revolutionists, and not yield to them. It is very difficult for Englishmen, with all their prepossessions in favour of liberty, to say that he was wrong. Concessions made by a sovereign are very wise when they are concessions made to the nation over which he rules, and when the changes he accepts are desired by a nation that is fit for them. No one has made more concessions and accepted greater changes than the Emperor of AUSTRIA; and the result has been that he is in every way more powerful and exorcises a far deeper influence than when he first wore his crown. But his concessions were to the Hungarian nation, to the Polish nation, to the German laity, to a strong and rich middle class, to army reformers who were only bent on making the Austrian army the best that could be got. In Russia there was nothing asked for by the revolutionists which was also asked for by the nation, and for which it was fitted. Nothing would have satisfied his enemies, who had only one idea—that they would tell him what to do, and would kill him if he did not do it. Some changes were, indeed, asked for by the nation, and with demands that were justifiable the CZAR has done his best to fall in. The peasants were suffering partly from bad seasons and partly from their own improvidence, and the CZAR has partially mitigated the prevailing distress by taking on the State a greater burden than properly fell on it. There was a general dissatisfaction felt with the prevailing corruption of officials; and the CZAR has announced that he will set his face against corruption, and will dismiss without stint and without pity officials whose hands are not pure. There is not much in this. All new brooms sweep clean, and the tide of corruption is not to be stemmed by the spasmodic interference of Czars who may happen to be seized with a fit of virtue. It needs the perseverance of years to purify a corrupt administration. But the CZAR can only make a beginning whether he perseveres in efforts or not, and this beginning he has made. Corrupt officials will probably not be much frightened by hearing that the CZAR is going to introduce a reign of purity. No sovereign wishes his officials to be corrupt, and all sovereigns from time to time denounce corruption. But the CZAR wishes to mark at the outset the general character of his rule, and it is at any rate some encouragement to the sound portion of Russian society that the CZAR should take an early opportunity of letting it be known that he is as much opposed to corruption as anyone can be.

That the foreign policy of the CZAR should be pacific is not a matter of probability, but of necessity. A man who is shut up as a prisoner by revolutionists and assassins is not likely to be inclined to war or to adventure. Sometimes, no doubt, sovereigns attempt to allay popular discontent or to divert popular attention by embarking on war. But the CZAR knows that his father tried this hazardous experiment and that it was a total failure. Far from stopping revolution, it was the Turkish war that brought Russian revolution to a head. It excited the people, impoverished them, and stimulated comparisons between the despotism which Russians felt at home and the liberties they won for outsiders. The

CZAR seems convinced that not only will war do him no good, and that Russia cannot afford a war, but that Russia cannot even afford an army fit to make war. He sees that he has no choice except between national bankruptcy and a diminution of the extravagant amount spent on the army. On paper Russia has, or ought soon to have, an army of two millions of men; but Russia cannot possibly pay for an army of two millions strong. One of the elements of all calculations as to the future of Europe which most deserves to be kept in view is that France is the only nation which can really afford to keep up the huge army which it is the fashion of modern European nations to create. Italy notoriously wants to have an army out of proportion to its resources, and Ministry after Ministry falls because foolish Italians want to have more soldiers than they can support. Russia has now gone a step further, and owns that it must reduce its army, because it cannot meet the expense which the army entails. It managed to get through a costly war without that breakdown of its finances which there seemed good reason to expect. But it is now paying for this war, and it can only pay for it by weakening its great instrument of war. The same reasons, too, which inspire the CZAR with a distaste for war also inspire him with a distaste for adventure. The deputies of the Tekke Turkomans have just been received in great state at St. Petersburg, and have vowed allegiance to the CZAR. Even a representative from the Turkomans of Merv was present, although it is not clear for whom or by whose authority he spoke. But the submission of the Turkomans is the work of General SKOBLEFF, and he himself is in deep disgrace. The conquering hero was informed by the CZAR that there was nothing the CZAR hated so much as enterprises which embroil him with foreign Powers and excite the nation without doing it any good. There is no reason to doubt that the CZAR spoke what were his real feelings at the moment. As he had to reap the fruits of his general's victories, he could not avoid receiving with grace those who came to St. Petersburg to tender their submission, but he might at the same time honestly disapprove of the policy which had won this submission at a cost far heavier than it was worth. This feeling may some day pass away. If he wins in his great fight with the revolutionists, if Russia begins to breathe again, and something like peace and order is restored, he may come to look with greater favour on enterprises which are very much in harmony with the traditions and aspirations of his people. But the time has not yet come for such a change of feeling in the CZAR; and it may be safely said that, if Russia waits for a great war until she can afford one, years must elapse before a nation, the mainsprings of whose riches have been so seriously weakened, can treat itself to the most expensive of all luxuries.

THE SENATE AND THE SCRUTINS.

EVEN a Second Chamber which is as old as representative government has sometimes to play a part more in accordance with a prudent calculation of its powers than with its estimate of what is best as regards the particular measure under debate. Much more ought a Second Chamber which is only six years old, and is as yet wholly destitute of traditional authority, to be careful not to provoke an unequal conflict. By rejecting the *Scrutin de liste* after its adoption by the Chamber of Deputies, the Senate has tempted destruction just when circumstances were in an unusual degree making in its favour. It may not say much for the strength or independence of the Senate that M. GAMBETTA's reference to it at Cahors has been everywhere accepted as immensely increasing its chance of living. But it is better to be weak and protected than to be weak and solitary, and these appear to be the alternatives between which the Senate has made its choice. M. GAMBETTA was anxious that the Bill establishing the *Scrutin de liste* should be passed before the elections, and the opportunity of resisting him to any useful purpose was gone when the Bill was accepted by the Chamber of Deputies. Whether it would have been wise to have made use of that opportunity is a point upon which much might be said, but there is not a single serious argument to be alleged in favour of the course recommended by M. WADDINGTON. The Senate cannot suppose that it represents a majority in the country—indeed there is nothing to show that it even represents a strong minority.

Outside the Legislature and the Elysée nobody seems to care under which *Scrutin* the elections take place. The question has excited no enthusiasm in the constituencies, for the very simple reason that a small constituency is hardly ever anxious to be merged in a larger one. When several *arrondissements*, now returning a single member each, are grouped together in a department returning as many members as there are *arrondissements*, there will necessarily be a large loss of individual importance. The politicians who have been important in an *arrondissement* are not so conceited as to suppose that they will be equally important in a department. But nothing has happened to show that this natural dislike to absorption in a larger body has made the constituencies active partisans of the *Scrutin d'arrondissement*. Voting by departments is, on the whole, a Republican cry, and it has been recently made the especial cry of M. GAMBETTA. France is not a country in which a popular leader is deserted because his followers do not agree with him upon points of constitutional detail. The rank and file of the popular party are at least well drilled. They know how to take orders and how to carry them out. Nor will the conditions of the controversy be in any sense the same now that the *Scrutin de liste* has been rejected by the Senate. What in the Chamber of Deputies was a struggle between two methods of voting has now become a struggle between the two Chambers. More than this, it has become a struggle between the less popular of the two Chambers and a great popular leader. On the one side there is the Senate—not in very good odour with Republicans generally, regarded by some as reactionary and obstructive, by others as unsuited to Republican ideas, with nothing between it and extinction except a revision of the Constitution, the machinery for which is all prepared. On the other side is M. GAMBETTA, the real depository of power in the present, the formal depository of power in the future, the man whose rise has been accepted as inevitable alike by the reactionary party and by the Republican, with the Chamber of Deputies and the constituencies at his back, and himself pledged to the assurance that without the *Scrutin de liste* any stable Government is impossible. If this is not an unequal conflict, there has never been an unequal conflict yet.

And for what end has the Senate engaged in it? To vindicate its authority as a co-ordinate branch of the Legislature. That is one answer. To prevent M. GAMBETTA from being the object of a plebiscite. That is the other answer. It is difficult to say which of the two is the less conclusive. The Senate, like all Second Chambers, exists not to vindicate its own authority, but to defend the principles of political and social order in the event of their being assailed by the popular Chamber. When any one of those principles is really at stake, a Second Chamber has no business to think of consequences. If it surrenders the point in dispute, it surrenders that which it was expressly created to defend. Nothing, therefore, can be gained by avoiding a conflict. A Second Chamber which is too weak or too timid to do the particular work which it is designed to do may as well not exist. But when no such principle is at stake, a Second Chamber is bound to think of consequences. It has no right to engage in a warfare which may possibly incapacitate it from hereafter fulfilling its own proper function under the most favourable conditions and to the best possible advantage. There is no principle of political or social order involved in the present controversy. It relates only to a question of machinery—an important question, if you like, but still a question of machinery, and nothing more. If the Senate could have rejected the *Scrutin de liste* without incurring any risk, the case would have been different. It might then have been guided entirely by an abstract preference for small constituencies over large. But if even a slight risk had to be incurred in order to indulge this preference, it was the duty of the Senate to mortify its desire to slap M. GAMBETTA in the face, and to think of the larger interests committed to its charge. In the present instance the risk incurred is of the most serious kind. The approaching elections will take place under a *Scrutin* imposed upon the country by the will of one branch of the Legislature, and that not the branch to which the *Scrutin* in question has reference. The less popular of the two Chambers—the Chamber which is returned by indirect election, and which itself fills up a fourth of its own vacancies—has dictated to the country how the electors who return the more popular Chamber—

the Chamber which springs directly from universal suffrage, and undergoes entire renewal at each general election—shall be distributed. That is a far more exciting question than the comparative methods of the *Scrutin de liste* and the *Scrutin d'arrondissement*. If the Chamber of Deputies had rejected M. BARDOUX's Bill, it is probable that even M. GAMBETTA would have found it impossible to evoke any popular excitement. But when it is the Senate that has rejected it, he has very different cards in his hand. He will be able to accuse the Senate of thrusting itself between the constituencies and their representatives; of going out of its way to determine a point which, though it may technically come within its province, ought really to be decided by the Chamber of Deputies alone; of attacking universal suffrage in the persons of the majority directly returned by universal suffrage. In this campaign M. GAMBETTA will be able to combine forces which have lately seemed to be separated beyond the possibility of re-union. He will have the support of the Republican party generally on the ground that the Senate has shown an entire ignorance of its true position under the Constitution. He will have the support of the Extreme Left on the ground that the Senate is a mischievous appendage to the Constitution which cannot too soon be got rid of.

The probable result will be that M. GAMBETTA will be placed in power just as effectually as though the Senate had voted the *Scrutin de liste*. The difference will be that he will be placed there as the enemy of the Senate, not as its friend, and after a struggle which will have the abolition of a Second Chamber as the declared aim of a part, at all events, of those who take part in it. It will not be possible for M. GAMBETTA to refuse the help of this last section of Republicans, even if he desires to do so. Nor is it even certain that he will desire to do so. M. GAMBETTA is not without his share of imperiousness, and though he was well disposed towards the Senate a fortnight ago, he may not remain well disposed now that by an unexpectedly large majority it has bidden him defiance. Important as M. GAMBETTA has chosen to make the *Scrutin de liste*, it is mainly important because he has made it so. The Senate has acted as though the reverse of this were the truth, as though, if no more were heard of the *Scrutin de liste*, no more would be heard of M. GAMBETTA. If this is the genuine conviction of the majority which rejected M. BARDOUX's Bill, it does not say much for the accuracy of their political vision. If it is not their genuine conviction—if, that is, they have voted with a just appreciation of M. GAMBETTA's strength—it does not say much for the soundness of their political judgment. The recognition of M. GAMBETTA as the destined ruler of France is a strange reason for provoking a quarrel with him on the eve of his taking possession of supreme power. It may be heroic not to worship the rising sun, but there is but little practical wisdom in trying to keep it below the horizon.

A SQUIRE'S NOTE-BOOK IN THE SEVENTEENTH CENTURY.

ADVANCED politicians of the present day, bent upon reducing owners of property into rent-chargers and on cutting up fine estates into small pieces, may possibly not care to know how land was farmed or leased some two centuries back. What to them are old-fashioned fines and abatements *tempore Caroli Secundi*, or why should they trouble themselves about the price of wool and bark, stewards' charges, manorial rights, parochial charities, and all the other stupid details which bound tenants and landlords together about the time of the Exclusion Bill? It is sufficient for such persons that land in England is held by tenures wholly different from those in force in most Continental nations and in our Indian dependency; and that the last vestiges of "feudalism" are doomed to disappear. But to those who like to know how properties grew, devolved, and were managed by our ancestors, nothing is more attractive than the discovery of some ancient record, in the family chest or lumber-room, which, by an incredible piece of good fortune, has survived the inroads of housemaids and rats. One of these antique treasures has just fallen into our hands, and for practical men it is quite worth a barrel of flint and stone instruments adapted to the use of beings something between Bushmen and Yahoos. This said record consists of about ninety pages of stiff paper loosely stitched together by thongs of leather and covered with a thicker material now embrowned by age and dust. It is not exactly a diary, for chronological order is defied. Neither is it a mere book of accounts, made up of pounds and shillings and little else that can appeal to human sympathies.

The owner appears to have used it for the purpose of entering all the details of the receipts and expenditure of his not inconsiderable estates, and he was further in the habit of recording in it, just as they happened, the events which diversified his life in country and in town; the visits of friends and relations, marriages, births, and deaths, the time and money spent on journeys to London, the sale of stock of various kinds, a lawsuit with a neighbour, an unreasonable claim of the Dean and Chapter, remedies against paralysis and apoplexy, a certain cure for the cramp, and the stipend of the village schoolmaster. Such are the staple entries of a manuscript which would have delighted Jonathan Oldbuck, and might furnish a novelist with a chapter in a tale about Roundheads and Cavaliers. We may premise that the writer of the diary—for such we must call it—was Sir John Brownlow, of Belton, Lincolnshire, and that his estates passed by marriage into the family of Sir John Cusst, Speaker of the House of Commons in the first ten years of George III. They are now held by his direct descendant. The handwriting of the diary is strong, clear, and legible. There is no recourse to perplexing ciphers; no asterisks or blanks to create unappeasable longings and stimulate prurient curiosity; and not a remark that need cause any one a pang or a blush. The writer occasionally interpolates a sentence or two in French, possibly with the object of airing his knowledge of that language, for it is sufficiently clear that there was nothing to be hidden. "*Nous partismes de Londres*"; "*Je vins à Ringston*"; "*une charrette de paille à vendre*"; "*des arbres se doivent abatre*," these and other scraps of the French language might surely have been transcribed into the plainest English without any one being the better or the worse. And now to pick out a few of the items which the writer jotted down, we will undertake to say, without the faintest idea that they would ever form the groundwork of a short essay in the nineteenth century.

We should state that in the reign of Elizabeth there was a certain Prothonotary of the Court of Common Pleas, who acquired an estate in Lincolnshire that had belonged to the monastery of the Blessed Mary of York. This property had been sold by Henry VIII. to a family, in whose possession it remained for forty-five years, after which, eventually, it passed to Richard Brownlow, the aforesaid Prothonotary. He had two sons, William and John, created Baronets by Charles I. in 1641. The writer of our memoir, Sir John Brownlow, was born in 1594, married Alice Pultney of Misterton in Leicestershire in 1621, and died *sine prole* in 1679. His estates then went to his grandnephew, also Sir John Brownlow. He possessed a house at Iselworth, twelve miles from London; a mansion in Drury Lane; and estates in Lincolnshire near Grantham, rather more than one hundred miles from London. The journey from London to his country house seems always to have taken three or four days. We presume the family horses were employed, and one page shows that they came to London in April, returned to Lincolnshire in July, came again to London at the end of that month, and went down in August to remain for the autumn and winter. If a memorandum-book of this kind presumably gives any indication of character, we should say that Sir John must have been a person of excellent business habits; careful in the discharge of his duties and scrupulous in the administration of his estates; hospitable to friends and generous to the poor; a good Churchman and a staunch Royalist; in short, just one of those ancient squires who, with a little extra touch of colour, might figure well in the foreground of the now abandoned historical novel.

Three different stewards, Cardiff, Batchelor, and Richard Fullalow, appear to have collected and accounted for rents, and occasionally other large sums passed through the hands of one John Smith. If the rents for those times were considerable, so, on the other hand, were the outgoings. Out of 3,933l. more than 850l. were disbursed; out of 566l. nothing remained but one guinea; and out of 444l. only 11l. 13s. 1d. But to some of these balance-sheets are appended careful notes which show that divers other items had still to be accounted for or recovered. Poles of wood or Naypoles had been sold for several pounds; one hundred wethers fetched more than a pound a-piece; oats and barley brought in more than 30l.; one Mr. Greenberrie was to pay 70l. at May Day; wood, old and new, realized a good price; and there are constant entries showing that Sir John was quite alive to the necessity of being just to himself as well as generous to others. Peter Inckler owed a fine and was to sell a horse; Wetherall and Battie owed five guineas by bond, which another entry shows them to have paid. W. Olay might have half the roots in his little ground, and Sir John would stand half the cost of digging it; Will Buckberrie was to refund out-rents paid for him at London; if Thomas Garland wanted to "plow more, then he mus pay for it." Mr. Dove might for five shillings have a tree which had been blown down in the ash close; and there is an ominous query whether, if worthy Batchelor had formerly got 140l. from Cardiff, he was not bound by his own admission to pay 60l. out of it to one Aberley.

The prices of skilled and unskilled labour and of articles and stock are noteworthy. The doctor's fee for attendance on "my wyfe" was ten shillings; when Cardiff fell ill, Batchelor felled an acre for him, and might, we should think, have "stabbed Thornaby Waste." In one bag of 100l., 9s. 2d. were wanting; but Cardiff, we are happy to state, made good the deficiency. Jack Sayle was a long time paying his debt. Smeton might be permitted to have the grass mowed off the bowling-green, for so we interpret the *herbe au jeu de boules*. A beast that died of the "gargol" about the 6th of September sold for nearly 3l.; a pair of gloves cost

3s. 6d., and a ribbon 1s. 6d. Kerbie cow pasture was to be disposed of at Lady Day, and the thorns were to be grubbed up. Timothy Dove had a second presentation to two parts of the rectory at Rippengale. In a lease of eleven years the tenant had permission to plough for eight years, but not for the last three. 20s. a year was the honorarium attached to the duty of reading prayers twice every week to the poor at the almshouses; and various contributions, including one from Sir John himself, made up the schoolmaster's stipend of 17l. a year. We remark that while Sir John Wray, Richard Nelthorpe, *gent.*, Sir P. Tirwhit, H. Luddington, and others, contributed sums to the above end, of from 12s. to 2l. 10s., Corpus Christi College only gave 1s. 3d. to the above village dominie.

In the jottings of a Lincolnshire magnate we expected to find some allusion to field sports, but in this we have been rather disappointed. There is mention of gorse and cover, and the extent of the West Fenn country is put down as 19,000 acres, and it probably continued to be the "haunt of coot and hern" up to the beginning of the present century. But we hear nothing of decoys and mallards, springes and woodcocks. One tenant is, however, bound by the terms of his lease, to maintain "the warren and to leave one hundred couple of rabbits," and in some exchange of property with the Earl of Lindsey, a doubt is expressed whether free warren in Scottlethorpe had or had not been included. This reminds us of Dr. Johnson and Bennet Langton, of whom the Doctor declared that he was one of the oldest families in England:—"Langton, Sir, has a grant of free warren from Henry II.; and Cardinal Stephen Langton, in King John's reign, was of this family."

The following entries afford some clue to the value of landed property. 5,500l. represented eighteen years' purchase; 19,000l. was given for 976l. per annum, but in all probability the outgoings were considerable, seeing that in another account of Sir John's own estate, 1,724l. were disbursed out of 2,376l. received. If any doubt could ever have arisen as to the politics of the author, it would at once be solved by the loan made to the King two years after the Restoration. Charles wanted 500l. within fourteen days, and it was raised and paid by the writer in one-seventh of that time. Indeed, there was always a large store of coin placed in bags and deposited in the family chests at Isleworth or in Lincolnshire. Coin of the Protector's time to the amount of two or three hundred pounds had been left in the iron chest, and there seems to have been no attempt at turning a penny or getting any interest, except in one or two ways. The gold and silver lay idle in bags, and was only drawn on for the necessities of nephews, for marriage portions, for loans on mortgages, and for the purchase of more land. Macaulay, vol. iv. p. 319, writing of 1692, says that to many busy men, after the year's expenses of housekeeping had been defrayed out of the year's income, a surplus remained; and that a lawyer or merchant who had saved thousands was often embarrassed about investing them. The father of Pope the poet carried to a retreat in the country, the historian goes on to say, a strong box containing nearly twenty thousand pounds. This is exactly what Sir John repeatedly did in the memoir before us, and once he expressly tells us that at the time of the Great Fire of London he removed sixty-six bags of coin to his residence at Isleworth for safety.

In his dealings with his nearest relatives Sir John kept a strict account, in which we do not perceive any traces of penuriousness or unkindness. Every now and then he gave his best diamond ring and his great jewels to his wife. Then he took them back and then he gave them up again. To his nephew Sherard he made repeated loans, sometimes as much as 500l. at a time. To a young lady his great-niece, he gave a marriage portion of 3,000l. He put the children of twelve poor folks to school at a cost of half a crown a quarter for each child. He allowed R. Johnson to keep a horse in his woods; he founded almshouses; he made presents to high and low; on one occasion his liberality took the form of silver candlesticks and snufflers; on another he gave tankards; and then, again, he paid the rent of a house for his "Cosen Smith" for life.

Antiquarians may regret to learn that men had made oatmeal at Grantham "where Bacon dwelt"; but the house believed to be a horse-mill, had disappeared at the time of this memoir and a stable had also gone with it. The following items of legal expenses are shown in a trial in the Court of Common Pleas, the result of which is not very clear. The cause of action was a claim for "tith of hay and corn" growing in a certain parish, and it was brought under the statute of Edward VI. One-and-twenty jurors appeared and received five pounds each, besides their dinners. Serjeant Maynard—no doubt the same who told William III. that, if it had not been for His Majesty, he would have survived the law as well as the lawyers—had for his fee at the trial "6 ginnies," and "at other tymes, three ginnies." But Serjeants Baldwin, Turner, and Browne also had their 3 and 4 ginnies, and other fees, at odd times; and there were fees in Court of 4l. 10s., the charges of witnesses, and the bill of "Mr. Grange who solicited," which amounted to eight pounds all but sixpence. There is, too, a memo which we interpret to mean that, of the twenty-one jurymen, the nine who were not wanted and were not sworn need not have had as much as the twelve good and true men who sat on the trial; 3l. a-piece might have served the former. In this sentiment the reader will no doubt concur. Shortly before this event the Sub-Dean of Lincoln claimed to be patron of the church at Snarford with tithes, great and small, and also of a vicarage, and Sir John was called on to restore the rights of the

church, the Sub-Dean undertaking to keep up the vicarage and to provide a minister for the service. To this the prudent Sir John was disposed to make answer that, "if anything be due more than is paid, it is from the tenants, and not from me, and that there was a *modus decimandi* by prescription." We do not make out the result of the claim, but there seems to have been an offer of a compromise, the Sub-Dean paying a portion and the Lord of the Manor the rest. Against this demand the diary appears to have contemplated some counter-claim for a sum that had been constantly paid before the civil wars; but as the church lands had been sold and dispersed, "I know not of whom to demand, and know not how to recover it." The issue of another claim by a certain parson is, however, not at all doubtful. It was for twenty-nine acres of glebe lying dispersed in the parish by an ancient service of one parson Buckberrie, in 1577. The last incumbent had, however, claimed nothing, and when his successor filed a bill in Chancery against Sir John, a freeholder, and one other person, a good answer was put in, the parson was ousted, and the suit ceased. To turn from these clerical disputes, which are more edifying than ritualistic squabbles, to smaller matters, we find that to prevent lethargy or apoplexy, there was nothing like some sneezing powder, made of dried betony, tobacco, and a little musk. This, with blisters on the neck, a warming-pan held to the head, and oil of amber to the nostrils and temples, was the prescription of one worthy Doctor Walldron in his letter of July 14th, 1666. Failing this there was another prescription too long to quote. To feed bees properly you are to get roasted apples, bean flower, and bay salt, or else sop toasts of bread in strong ale and put them into the hive. For the biting of any venomous creature, hold a hot iron to the place affected or a coal of fire; and a piece of briony-root worn about one will cure and prevent the cramp, while mare's milk drunk by women every morning in March and April will tend to conception. There are other curious entries, but our space is running short, and when we have noted that one line commemorates the death of Nicholas the cooke, and the very next that of the Duchess of Dudley, we come to the last entry of all, which has a tinge of sadness and yet fittingly closes a record over which Thackeray would have moralized. It is as follows, spelling and all:—"My dear wyfe dyed at Isleworth on tuesday the 27th of June 1675, between one and twoe at noone: exceeding suddenlie (no cause for it appearing), being 68 years of age as was apprehended or very near it. The corps being very well embalmed in a very good coffin was removed, late in the evening, about 10 o'clock, toward London and brought to my house in Drurie Lane on the 30th of June following, and on the 5th of Julie after, was carried towards Belton and there was buried on the 7th of Julie, where I also intend to lye."

A note adds that the age was probably seventy-two. The writer survived his partner, and died without issue some four years afterwards. A solid monument with the effigies of this excellent couple attests their virtues, and we may be permitted to doubt whether any brief diaries or loose memoranda kept in this age of bustle, excitement, and perhaps shams, will, if revealed in the year 2081, excel this record in interest and solid worth.

PAST AND PRESENT.

IN a letter sent last week by a Correspondent of the *Daily News* from Tunis there was a passage which might have given occasion for not a little thought to readers of that and other journals. "It has been a great surprise to me to find," says the writer, "the strong conviction that exists among all Arabs leading an Arab's life that England must interfere in their favour. The England these people rely on is not the one you and I live in, but the England of Wellington and Nelson, the enemy of France, the most powerful of all powers, always ready to strike a blow for a weaker friend; a nation that never lies. It is foolish, I own, but many a time lately my heart has been stirred by appeals and arguments based on the above estimate of English character; and I have not had the courage to try and convince the poor fellows of the very small chance of interference by our Government on their behalf." There may possibly be two opinions about the foolishness of the Correspondent's heart-stirrings; there can be but one as to the wisdom of his belief in the change from the England of history to the England of fact. Perhaps the description of the former England as the England of Wellington and Nelson is, except as a mere chronological indication, unjust; for, to do our generals and admirals justice, there is no reason to believe in their degeneracy. They blunder now, but they used to blunder then; and now, as then, it is pretty safe to calculate that, with fair luck and due encouragement, Marlboroughs and Wolfes and Wellingtons can be produced as well as Galways and Sackvilles and Whitlockes. The real difference is not in English generalship, or even in English soldiery; for it may be whispered in confidence to those who are not experts in military history that there were scares before "Fort Funk," and succumbings to an inferior enemy before Majuba. The difference is in English policy and English public opinion—in short, as the Correspondent very aptly puts it, in "the England in which you and I live" as compared with the England in which our grandfathers lived.

Even here of course it is necessary not to exaggerate. Just as there were blundering generals and time-serving generals of

old, so there were politicians who kept their consciences in their tempers or in their purses, who made the difficulty of the nation the opportunity of a party, who cringed and bullied in office, who defamed and caballed out of it. But where, without being extraordinarily pessimist, it is possible to see a distinct deterioration is in the fact that all these things, which were once looked upon with unqualified disfavour (in whatever party they appeared) by the nation at large, are now abetted and defended by a great, if not the greatest, part of that nation, a part which has next to no interest in abetting or in aiding them. The pamphleteer of the last century who drew pen in a Minister's service was in most cases a simple hireling, whose individual moral degradation might be considerable, but whose proceedings indicated no corresponding degradation on the part of the public. The modern journalist who praises the conduct of the present Government in the Transvaal, or in the teeth of the reports appearing in his own columns, accuses the Opposition of factiously obstructing Mr. Gladstone, is individually a much more respectable person than his spiritual ancestors; but as a symptom he is a much more unpleasant phenomenon. There is no reason to think that he says what he does not think; if he did it would not matter. But if he does think what he says, and if his readers and partisans think so too, it follows that the sense of national honour is absolutely extinct in them, and the capacity of political judgment hopelessly warped. For a parallel extinction and a parallel warping it is vain to look backwards, for none such will be found. On two occasions something faintly and distantly resembling the foreign policy of the present Government was the subject of violent reprehension on the part of one English party and of violent defence on the other. The Peace of Utrecht, with the abandonment of the Catalans, was the one; the peace of Paris, following on the partial abandonment of Frederick II., was the other. But in respect of relinquishments of territory and other advantages, the only charge against Harley and Bute was that they did not make enough profit, not that they abandoned any of the actual possessions of the nation and the Crown. As to the Catalans, though they were not too handsomely treated, it was, after all, the business of the sovereign they had supported to look after them, not the business of the English; and Frederick was a person quite able to take care of himself, as well as one who had got from the English alliance much more than he gave for it. Thus the conduct of the Ministry of the day, if open to attack, was also capable of making a very good defence. It is perfectly certain that the Transvaal business—with its ignominious surrender, its unavenged defeats, and its abandonment of Englishmen and English subjects—would, either at the beginning or the middle of the last century, have raised a storm which all the boroughmongering and Parliamentary jobbing of the day would not have enabled the Ministry guilty of it to weather. Again, the policy of the late Government was in many respects analogous to that of the various Tory Governments of the revolutionary period. But, while the sense of national interest and national honour in the latter case was strong enough to leave only an insignificant fraction of the Whig party in irreconcilable opposition, that sense was the other day so weakened that only a still more insignificant fraction abstained from opposition of the most virulent and factious kind. The greater the purity of modern political life the more sinister is the spectacle which from this point of view that life presents. If Sir Wilfrid Lawson saw his way in his action on the Transvaal matter to a pension of five thousand a year, with places and reversions worth ten thousand or twenty thousand more for his relations and friends, his conduct would not be half so disquieting. If the editors of Government journals received an occasional five hundred pound note from Lord Richard Grosvenor, in return for a particularly telling exposition of the text that, Irish property being robbery, all Irish persons with a taste for robbery ought to be made proprietors, there would be no cause for alarm. These persons, instead of being, as they are now, most estimable gentlemen, would be simple scoundrels, and as, though the majority is often composed of fools, scoundrels are on the whole in a decided minority in the human race, prospects would be tolerably encouraging. It would sometimes be for the interest of the dishonest men to take the right side, and the honest men would not be in danger of perversion in these gross and palpable ways. This is the explanation of what has often puzzled enquiring, but not very long-sighted, historical students, the combination of flagrant political dishonesty in the last century with a total result, chequered of course by individual folly or rascality, but still, on the whole, a total result, of continual national prosperity. Almost everybody was sound on the root of the matter, the doctrine which Thackeray (not a Tory politician by any means) has happily formulated in *Edmond*, with reference to the greatest genius and the greatest scoundrel in English military history—"In face of the enemy there was no question at all. Wherever my Lord Duke found a French army he would fight it and beat it."

"In face of the enemy there was no question whatever." It would probably be impossible in any ten words to formulate more sharply the doctrine which still about a century ago, was the doctrine of all Englishmen, whatever politics who were not individually villains, and of some who were, and which has only lately been openly denied by any considerable body either of politicians or of Englishmen in general. It would be impossible also to express both in deeds and words the opposite of this doctrine more strikingly than has been done by Mr. Gladstone's Ministry and by its supporters. It is in the face of the enemy that questions begin. At more or less distance from that formidable person they

can be brave enough in Queen's Speeches and otherwise. But in face of him? That is another matter. And when he has still further altered the relative position, and obtained a view not of their faces, but their backs, the matter is different still. The motto of the Radical in power appears to be not to fight the enemy and beat him wherever you find him, but to run away from him and be beaten by him wherever he finds you. The doctrine has been applied most signally and in most remarkable fashion of course in the Transvaal. It has been applied in a hesitating and fitful sort of way in Ireland; and now the Radical organs are urging the Radical Ministry to apply it altogether, to give up coercion, to capitulate with Archbishop Oroke, to browbeat the House of Lords (who are thought to be weak and safe to browbeat), and to rob the Irish landlords retrospectively as well as prospectively as a peace offering to the redoubtable Land League. We do not say that the country approves these doctrines—indeed there is considerable evidence of a certain sullen and undecided kind of disapproval which may or may not break out into active revolt. But the point is that in a healthy state of national opinion the disapproval would have been instant, loud, and conclusive. The same may be said of the Bradlaugh business, though a somewhat different point is involved. But it is in reference to foreign and Irish policy chiefly that the difference is to be noted. In home politics there has been no such breach with ancient tradition, though of late years the party of destruction have made the pace somewhat faster than it used to be, and the course has been very considerably less well chosen. But the real point is that in reference to Ireland and to foreign Powers, including their high mightinesses of the defunct Republic which has (reversing the old story) painted out "Requiescat in pace," and painted in "Resurgam" on its hatchment. The old policy of England in all matters where armed resistance was expected or shown was a word and a blow, and the blow first. The new policy retains the words, but substitutes the reception for the administration of blows, and the nation, or a great part of the nation, if it does not exactly approve the change, permits it. It is of course possible that this oblivion of the simple fact that a nation is an association for the purpose of self-preservation, and that self-preservation means hitting out at all comers who appear dangerous, may be temporary, and that a reaction may follow. The curious thing is that, though democracies are not, as a rule, by any means patient or meek, to all appearance the delight of going against a Tory and aristocratic tradition has absorbed all other feelings in the Radical and democratic mind of England. The Radical, no doubt, promises himself that in the blessed days of the federated Hibernian, Caledonian, Wallian, and Anglian Republics (we name them in due order of dignity and without prejudice to the rights of Sodor and Man, &c.), he will make up for past *reculements* by the most vigorous leaps. Even on this supposition, however, the process is dangerous. When all the vantage points which benighted ancestors seized have been given up, and when the average Englishman has been brought to appreciate more fully even than at present the magnanimous satisfaction of being beaten and the exquisite luxury of being kicked, recovery of spirit, and still more of dominion, may not be so easy. Malcontents might then quote "Non his juvenis orta," and so forth. But a quotation from the classics will probably be punishable by fine in those days, not on the healthy principle of "sconcing," once prevalent at the Universities, but as an evidence of "aristocracy," an insult to the sovereign people who have only learnt biology and the principles of physics, and a sign that the Past, and not the Present, engages the sympathies of the quoter.

MR. FROUDE ON THE TRACTARIAN MOVEMENT.

MR. ANTHONY FROUDE, as we all know, is nothing if not a controversialist. He has passed indeed in his time through almost as many "phases of faith" as another prominent writer of the day, but in none of them has he ever lacked the courage of his opinions or the courage of attacking their opposites. In his early Oxford career he was an ardent disciple of Mr. Newman's, and wrote, as he has just reminded us, *Lives of the Saints*. From Newmanism, as it used then to be called, he suddenly turned to what is now designated Agnosticism, and instead of *Lives of the Saints*, we had *Shadows of the Clouds* and the *Nemesis of Faith* from his facile pen. But soon another change passed over the spirit of his dream, and he became convinced that these "roads, both of them, lead to the wrong place"; and he next posed as the apostle of that robust, if somewhat illogical, form of English Protestant orthodoxy, which takes Henry VIII. and good Queen Bess as its patron Saints, and treats all who opposed them, in politics or religion, as no better than fools or fanatics. In that drastic and uncompromising temper which he had partly acquired from his second master, the biographer of Frederick the Great, he composed his *History of England*. He has more recently indeed given us a *Sketch of Julius Cæsar*, which might seem a sufficiently neutral and undogmatic subject, yet even there his irrepressible theological or anti-theological instincts proved too much for him, and he could not refrain from ending with an elaborate parallel—which to most readers appeared equally foolish and indecent—between Cæsar and Christ. He has now been good enough, beguiled perhaps by the illustrious example of his old master, to give us a sort of *Apologia pro Vita Sua* in the shape of a series of Letters on the Tractarian movement, which has been published in *Good Words*, and which

we may expect to see reprinted with *quorum pars magna fui* as a motto on the title-page. Tractarianism had been sketched already *ab intra* and *ab extra* from very various points of view, friendly, hostile, or indifferent, by Tractarians who were still High Churchmen, by Tractarians who had gone over to Rome, or had become Rationalists, by outsiders, like Dean Stanley, who professed a certain intellectual respect for a movement they heartily disliked and very imperfectly appreciated, and by outsiders like Sir James Stephen, who freely ridiculed what they neither respected nor understood. The peculiarity of Mr. Froude's method of delineation is that it is at once entirely *ab intra* and wholly unsympathetic, while the final criterion of the merits or demerits of the movement is found in its personal effect on himself. He was bred up in it, he tried it, and he rejected it—*voilà tout*. Its doom is sealed. That is the moral of the tale, but it is not of course stated precisely in those words. On the contrary it is England, or rather the present age, which has tried and rejected "Sacerdotalism"—Roman or Anglican—but it is clear enough to the intelligent reader that Mr. Froude's mind is a microcosm of the age.

Mr. Froude's estimate of the character and results of the movement is based on his estimate of the religious condition of England fifty years ago, before it began, which to religionists, or irreligionists, of every class will appear a somewhat singular one in its complacent optimism. In those good old days, we are told, all who openly questioned the truth of Christianity were treated as offenders and excommunicated by society, whereas now, while one set of men are bringing back mediævalism, another openly question not only miracles but Theism. Both alike are wrong; sensible men have as little to gain from those who teach that bishops in ordination give really supernatural powers, as from the school of scientific criticism. And "to raise a doubt about a creed established by general acceptance is a direct injury to the general welfare," and even "discussion about it is out of place, for only bad men wish to question the rule of life which religion commands." After this we are not surprised to learn, from this disciple of Mr. Carlyle's Gospel of force, that "in stern and serious ages the religion of every country has been under the charge of the law; and to deny it has been treated as a crime"—as e.g. by the Spanish Inquisition. It was an unfortunate "relaxation" when legal punishment was exchanged for social excommunication, but still the principle was retained, and on the whole "the Church [of England] was perhaps in the healthiest condition it had ever known" fifty years ago. It is still more surprising to hear what is however still more emphatically insisted upon by the writer, that the Church would have remained in that happy condition to this hour, if the Tractarians had never disturbed its peace. It was they who, in their restless craving for "something deeper and truer than satisfied the last century," upset the coach, or in Mr. Froude's more ornate diction, by touching one part of a piece of complicated machinery spoilt the whole. What "The Edinburgh Review" and Brougham and Mackintosh, and the Reform Ministry, and Low Church philosophy, and the London University" and Liberals in general—"whose talk was nine parts nonsense"—could never have achieved, was brought about by "young Oxford" under the auspices of Mr. Newman. "But for the Oxford movement, scepticism might have continued a harmless speculation of a few philosophers." Not that the fault of either sceptics or Tractarians lay in their disturbing faith—for that is a very secondary consideration—but in disturbing "an Established creed," which is quite another and a much better thing. For you do not ask of an Established Church or system of belief, any more than of a tree, "is it true, but is it *alive*?"—the italics are not ours—and if it is alive its orthodoxy must not be called in question with impunity. "Doctrinal problems were little thought of" in those halcyon days, either by priest or people. Parsons preached and people listened, much like Tennyson's "Northern Farmer" and his Rector:—

An' I niver knawed what a meán'd, but I thowt a 'ad summut to say,
An' I thowt a said what a ow't to 'a said an' I comed awa'y.

But if the parson was not a profound divine, he was "generally a magistrate," was looked up to in his parish as "the master," could not be looked down upon by "the family in the great house," and was oftener than not a good shot and a "moderate" fox-hunter. Such, Mr. Froude gives us to understand, was the state of the Church of England in general before the Tractarians with their wild-goose chase after "the something deeper and truer" turned it topsy-turvy, and let loose the flood-gates of infidelity. It was "the healthiest condition the Church had ever known." This is indeed a poetic picture truly charming in its Arcadian simplicity, but somehow it hardly seems to harmonize with the rougher teachings of reason or experience.

We cannot follow Mr. Froude in detail through the successive phases of his devious course. His second paper, which is chiefly a criticism of Mr. Keble, contains nothing specially remarkable. The next, which records his Oxford recollections of "John Henry Newman," is more interesting, though by no means equal in sympathetic discrimination to the sketch drawn some years ago by another hearer of Newman's in those early days. However, Mr. Froude is in the main appreciative and just in his account of the personal bearing and public teaching of the master he then revered. So little, he tells us, was Newman eager to make disciples that he never talked to undergraduates on theological questions, but on whatever subjects of the day were generally interesting, about which he always seemed to know more

than anybody else present. "He was never condescending with us, never didactic or authoritative; but what he said carried conviction along with it. When we were wrong he knew why we were wrong, and excused our mistakes to ourselves while he set us right. Perhaps his supreme merit as a talker was that he never tried to be witty or to say striking things. Ironical he could be, but not ill-natured. Not a malicious anecdote was ever heard from him. Prosy he could not be." Mr. Froude proceeds to explain how "no one who heard his sermons in those days could ever forget them," and recalls some characteristic illustrations of the peculiar force and fascination of his manner of preaching. In his next Letter he tells us how, after taking his degree, he went to spend some months in the family of an Evangelical clergyman in Ireland, and was amazed to find that Protestants, who did not believe in "the Catholic theory of the Sacraments" and thought "the Christian priesthood a fiction," could be such excellent people, whereupon straightway his "feelings of reverence for the Reformers revived." The process of reasoning is again Arcadian in its simplicity, and it is the stranger in a disciple of Mr. Newman's, who was so far from encouraging the absurd notion, which Mr. Froude attributes to himself, that "not even a Dissenter could be a really good man, and unbelievers were (necessarily and always) prodigates seeking only an excuse for indulging their wicked passions," that he has again and again in his writings insisted on the contrary fact and offered an explanation of it from his own point of view which is at least perfectly intelligible. Mr. Froude then tells us about Tract XC, which had appeared before his return to Oxford, and had stirred "not the university only, but all England" as with a hurricane. The argument of the famous Tract—if we rightly understand him—he considers to be a perfectly honest and legitimate one, and he insists that had the author waited a few years longer, he would have seen that the Church accepted it as such; "his impatient departure has been condemned by his own arguments." Mr. Froude then adds that to himself on his return to Oxford "Newman was as fascinating as ever," though he had acquired in Ireland the disturbing and novel conviction that there were good men who did not believe in Newmanism.

The last Letter is entitled "The Lives of the Saints." When Mr. Froude returned to Oxford, the series of *Lives of the English Saints* was in course of publication. In these most of the leading Tractarians took part, and they gained a high commendation from Dean Milman for historical insight and exquisite grace of style, though he thought the writers grievously misused their powers. Mr. Froude was asked to take part in this work, and "the proposal pleased and flattered" him. It seems a little odd, however, that he should have accepted the offer, however flattering, when he had already on his own showing lost, or nearly lost, all faith in "the Catholic theory" of things. And it is still less easy to understand why, when he had undertaken the task, he should have been "thrown into a wilderness of perplexities," and felt obliged "after a short experiment to retreat out of his occupation," simply because he found the Lives of the Saints full of miraculous stories, for which "the evidence is commonly respectable," but which were to him as incredible as the tales of "Amadis of Gaul" or "Orlando Furioso." One might have supposed that any educated man, though he had never been an ardent Tractarian, would know what kind of matter he was likely to meet with in the lives of mediæval Saints, and in Mr. Froude's case such ignorance is the more inexplicable, because several years before Mr. Newman himself had published an elaborate essay on Ecclesiastical Miracles, discussing in detail their characteristics, evidence, credibility, and relation to the miracles of Scripture. He seems to imply indeed in this very paper that he was familiar with the Essay—as it is hardly conceivable that he should not have been—and if so his "wilderness of perplexities" at finding what he had undertaken to write about becomes itself hopelessly perplexing. His third "serious discovery," like the two former ones about "good" Dissenters and "pure-minded" unbelievers, can hardly at least have been a discovery to anybody but himself. But it is time to come to an end, and we are sorry to find that the end of Mr. Froude's lucubrations is still more gloomy than the beginning. He began with a lamentation and he ends with a prophecy. We were reminded at the outset of that Paradisiac age of fox-hunting parsons and uninquiring, if somewhat unenthusiastic, believers which was rudely disturbed by the outbreak of the Tractarian movement; we are assured at the close that neither we nor our grandchildren for many generations will ever see the like again; "centuries will pass" before the golden age returns. It is indeed dispiriting to contemplate the prospect of the long æons during which "a ritualist English Church" and an unbelieving laity will be continually engaged in fruitlessly sparring at one another—we ask pardon for the homely phrase, but it exactly conveys the impression Mr. Froude's words have left on our mind—albeit there is some consolation in reflecting that there is a good time coming back for the race at last, though neither we nor our children's children will live to see it. "Centuries will pass first"—Keble and Newman wrought that irreparable evil for their anoffending posterity, but at last in the dim future "religion and common sense will again work together, with the practical harmony that existed between them in the days of Whately and Arnold and Hare and Sedgwick." Let us be thankful that there is yet this much of balm in Gilead.

CRICKET.

THOUGH the season is still young, a good deal of cricket has been played, and perhaps as much sport has been shown as in the whole of a wet summer like that of 1879. So far the character of the play has served to prove once more how completely cricket is a creature of the weather. We had an uncommonly dry spring, and from the very beginning of May long scores have been made. Dr. W. G. Grace has already passed his two hundred, we believe, in one of those local matches in which the Graces are wont to keep their neighbours occupied in the healthy exercise of fielding through the whole of a summer's day. At the Universities long scores have been the rule. The relative chances of Oxford and Cambridge are always the most interesting topics of discussion at the opening of the cricket season. On paper Cambridge seemed to have all the better of the position, and to be certain of repeating the victories of the last three years. Mr. Ivo Bligh, indeed, has not been able to take part in the matches; and, if he is still too unwell to play at Lord's, his absence will be regretted as much by tennis-players as by cricketers. Mr. Bligh might have been expected to come very near winning the silver reward of him who attains to be next to Mr. Heathcote. But, though he is absent, Cambridge has still Mr. Steel. As the grounds have been so lively and true this season, Mr. Steel has not had all his wonted success with the ball. The Gentlemen of England, a strong batting team, and the Yorkshire Eleven, have each exceeded three hundred in one innings against Cambridge. It is not possible to say at present whether the great genius of Mr. Steel has deserted him, or whether he has been badly served by the character of the ground. Bowlers are, like poets, the creatures of inspiration, and a great bowler has his *annus mirabilis*, when everything goes well with him, and his lean years when his wickets are expensive. Ever since Mr. Steel has played in the Cambridge Eleven, the weather, so unfortunate for the farmer, has provided wickets which were hard beneath and wet at top, or in other ways suited to his skill. If the storms of this week are to last, he may be as dangerous as ever at Lord's.

Cambridge seems to have no other bowler of very great mark. In playing against Kent at Lord's a few days ago, Mr. Ford was by no means on the spot. Though difficult when he was straight, he was not so straight as he might have been. Mr. Napier, who appears to be a fast bowler, may prove a worthy successor of Mr. Morton, who so puzzled the Australians on their first visit. The other bowlers do not appear to be more than respectable. But in batting Cambridge is known to be exceedingly strong. The three Messrs. Studd are really men who can be relied on by their University. One of them may chance to fail on any given occasion, but he who does not score never has to feel the truth of the Icelandic proverb, "Bare is back without brother behind it." The other two brothers are certain to put on about a hundred and fifty runs between them against any bowling, except, perhaps, that of Peate and Bates and Hill. Last year the batting of the two Studds entirely discomfited Oxford, even after Mr. Fowler's pads stamped Mr. Steel. He, too, has been scoring very steadily, and he is supported by Mr. Ford, a very dangerous bat, Mr. Lancashire, and an almost embarrassing choice of other good men. Thus, though Cambridge scarcely seems so strong in bowling as when she defeated the Australians, and though it is scarcely possible that any fielding can match what she displayed there, she is still very powerful.

In one respect Oxford has made an advance this year. She has got a respectable cricket-ground in the Parks, within easy reach of the Colleges. The yearning friends of the endowment of research watched with anguish the subscription which the University offered to the new cricket-ground. There was so much less to be divided between budding professors of various branches of the science of Hypothesis. The *Pall Mall Gazette* was made the mouthpiece of the misery of culture. But the new ground is really a great boon to the undergraduates. It prevents much waste of time, it enables reading men to practise—an exercise much more wholesome than walking round "Mesopotamia"—and it cuts down the expense of cabs and drags to Cowley and the Magdalen ground. It is scarcely more important that the new ground is a true and lively one, as the long scores of the present season testify. Oxford Elevens have been in the habit of coming up to Lord's discouraged, after six weeks spent in collecting ducks' eggs in the mud and slime of Cowley. This year they have had no such gloomy experiences to abate their confidence. But the team is by no means so strong, on paper, as that of Cambridge. Oxford has only one very "consummate" Freshman, Mr. Leslie, of Rugby, who has been scoring with much freedom. We have only seen Mr. Leslie at Lord's this year, when he played for Middlesex against Yorkshire. Though he got some runs in the second innings, in the first he was quite unable to master the problems of Peate and Bates. The former, who three years ago was rather a simple bowler, has developed into, perhaps, the most difficult of the day. His deliveries in the neighbourhood of the off-wicket have an alarming way of rising up particularly, so that even Mr. Grace seemed wholly puzzled by him in the first innings of "Over Thirty" against "Under Thirty." Mr. Leslie, as we have said, could not play Peate, but neither could Mr. Webb, Mr. Walker, nor Mr. Vernon. At Oxford the Rugby Freshman has almost invariably scored very highly. Mr. Whiting, also a Freshman, we believe, Mr. Thornton, Mr. Wilson, Mr. Kemp, and Mr. Evans, have made very considerable scores. But while any of these, with Mr. Trevor, perhaps the prettiest bat of them all, may get runs,

four or five of the Cambridge Eleven are morally certain to get runs. It is as if there were four Leslies at Cambridge to one at Oxford. In bowling Oxford is not strong. The baneful examination system has kept the captain in the schools. When Mr. Evans bowled against "Over Thirty" on Whit Monday, he was severely handled by the impetuous Mr. Hornby, and seemed by no means as fast and dangerous as he has sometimes been. Mr. Walker's name, too, has usually been absent from the Oxford Eleven, and we have scarcely had an opportunity of seeing whether he is as good this year as the Australians last year found him at Glasgow. In Mr. Robinson Oxford has a new fast bowler, who was very successful in the first innings of the Gentlemen of England. But that Eleven were by no means so strong as that which under the same name played Cambridge. For many years Oxford has been slack in securing severe trial matches, whereas Cambridge has already played Yorkshire, and intends, we understand, to play Lancashire. Though much depends on the weather, most prophets will expect to see Cambridge victorious at Lord's in the end of June. One of the best of cricketers and judges of cricket is, however, of the opposite opinion.

The match between "Over Thirty" and "Under Thirty" would have been an interesting one, in spite of the absence of Shaw (who has been batting wonderfully well this year), had it not been spoiled by the weather. It proved once more that he had recovered the art of bowling; and Mr. Ridley showed his old mastery with the bat. Mr. Pearson distinguished himself at the wicket, and Mr. Ridley's fielding at point rewarded enthusiasts who looked on in the icy cold of a British June. The ground being slow, Mr. Hornby hit much too soon at several balls, the result being strokes of the sort generally observed on village greens, and known to the fastidious as "agrarian outrages." It is worth noticing that Kent has beaten Derbyshire, strong as that county is in bowling. The victory was mainly due to the excellent batting of Lord Harris, who scored thirty-four, and, ably aided by Mr. Jones, made seventy-two, not out, in the second innings, when runs were badly wanted.

In contrast to the general prosperity of cricket is the quarrel between the Notts men and the County Committee. That Mr. Poljambé, Oacroft, Wild, Gunn, Brown, Miles, Wright, Sherwin, Lane, Butler, and Shore should represent Notts borders on the ludicrous. Notts is not herself without Shaw and Morley and Flowers. It is always difficult to unravel these quarrels, but there appear, as usual, to be faults on both sides. The trouble began with last year's ill-omened visit of the Australians. These men drew such large sums that English professionals became ambitious in their turn. The Notts men made a high, though perhaps not unreasonable, charge for playing against the Colonists. This caused some bad feeling. Then there was a quarrel as to whether a member of the Eleven might take a team under the county name to play eleven of Yorkshire. Though the member of the Eleven made large concessions, the Committee did not meet him in a very conciliatory spirit. Then came demands from the Committee, meant to protect the sacred name of "Nottinghamshire," and the Players in turn made new demands. Seven of them wanted engagements for the season's county matches, and the Committee would not make the engagement with more than five. There were much less justifiable stipulations about "benefits." There seems also to have been some want of courtesy on a certain occasion. On the whole, it is far from being "a very pretty quarrel," and we hope that the contending parties, like Mr. Gladstone, will submit these matters to peaceful arbitration. If the Committee and the Players will bury the private tomahawk, and only think of cricket and the county of Robin Hood, all may yet be well.

LITTÉRÉ.

THE death of M. Littré in the fulness of years and honours deprives France and Europe of certainly the greatest lexicographer of recent days, and France at least of the greatest example of that class of men of letters that she has ever possessed, even Henri Estienne being hardly an exception. Like Estienne, Johnson, and Grimm, M. Littré was a signal example of the futility of supposing that dictionary-making is the proper function only of a pedant who has no interest in words except as words only. He was not only a man of the very widest information and cultivation, both in science and literature, but his literary studies bore fruit in miscellaneous essays, translations, and other such like things of the least arid kind. Nothing could be further from the exertions of the mere pedant than the famous article which he wrote more than thirty years ago on Homer and French epic, with an included translation of part of the *Iliad* into French verse of the *Chanson-de-geste* pattern in language and metre. That the experiment was wholly successful could hardly be said; nor, for reasons the giving of which would necessitate a venture into that great and terrible wilderness the Homer-translation controversy, could it be expected to be so. But the attempt showed, as most of M. Littré's old French studies showed, that he had with the beautiful old tongue the kind of familiarity which scholars of the last and earlier generations had with the classics. From the point of view of modern and strictly scientific philology, his fashion of old French scholarship might be found fault with now and then, but not from the literary and humanist side. Indeed, his devotion to old

French was very much that of a humanist of the fifteenth and sixteenth centuries to Latin and Greek. He renewed only a year or two ago his practice in old French composition by translating Dante into the language which Dante himself heard from and talked to Frenchmen of his own day. At an earlier period he had taken a considerable part in the great and slowly advancing *Histoire littéraire* of France, one of his most noteworthy contributions being a paper on the *Romans d'aventures*, which is one of the best in the whole collection, though at the time the treasures of this department of literature were by no means so fully explored as at present. Nor should it be forgotten that M. Littré was one of the stoutest champions of the absolute continuity of French literature from the beginning to the present day. Every now and then, too, he would review the work of a fellow-labourer in singularly pleasant and appreciative essays. Some of these were republished not long ago, and were then noticed in these columns, the volume containing them including also a delightful paper, the title of which, "Comment j'ai fait mon Dictionnaire," best describes its contents.

Except to specialists of one kind or another, his Dictionary and the way in which he made it will always be the chief points of interest in M. Littré's work. Even as far as mere bulk, ponderable and numerable, is concerned, it is one of the most surprising works ever accomplished by a single man. But the bulk of it is by no means its most remarkable feature. The worker had considerably less assistance from his predecessors, as well as a much vaster expanse of ground to traverse, than most of those who can be compared to him. The great classical lexicographers of modern times in particular had the advantage of possessing in the Greek and Latin classics a field large and difficult indeed, but very clearly marked out, and capable of being traversed in no very extraordinary time. To read through every author quoted in *Faccoli* or in *Stephanus* would be a formidable task no doubt, but by no means a hopeless or an illimitable one. But the enormous mass of literature in which before the invention of printing France was richer than all the other European nations put together, while even since that time she has certainly not been inferior to any, exceeds in volume the subject-matter of the classical lexicographer almost infinitely. Nor, as has just been said, had the bold scholar much assistance from his predecessors. The slowly-moving Dictionary of the Academy seems to have frightened competitors out of the way by impressing upon them the hopelessness of doing in a single life what forty chosen lives, continued through half-a-dozen generations, had failed to achieve. The little good work which had been done, such as Nodier's, was for the most part fragmentary. M. Littré had, however, both the qualifications of genius—audacity and the capacity of taking pains. He had, of course, collaborators—the mere mechanical part of the work necessitated this—and of these M. Beaujean, the compiler subsequently of the excellent abridgment, which is probably the best hand dictionary of any modern language, is understood to have been the chief. But the plan, the capital fund of knowledge and study, and, in all important respects, the execution, were as much his own as in the case of any work of the kind, if not more. Considerations of proportion and of size made it unfortunately necessary to restrict the vocabulary and commentary in reference to the elder branch of the tongue with which M. Littré was so excellently qualified to deal. But quite recently, and with his own cordial approval, this work has been taken up, and a companion *Thesaurus* of old French, on a scale even more imposing and exhaustive, is already some stages on its journey.

If it be desirable that a dictionary-maker should know something of everything, as it certainly is, it may be doubted whether any one ever fulfilled the condition more satisfactorily. Omniscience was not M. Littré's foible; but it was in some respect his forte, and it was not an inaccurate omniscience either. He was, as is well known, by original education a student of medicine, though we believe he never fully graduated nor attempted to practise. He was an excellent Greek scholar, and his well-known *Hippocrates* made him a member of the Académie des Inscriptions long before the Académie Française deigned to admit the man who had beaten her single-handed at her own special task. He followed this up by a considerable number of works on medical and scientific history, and was at least a fair proficient in some Oriental tongues. But while literature, philology, and science would each have sufficed to give him a position of no small eminence, one important field to which he devoted his energies remains to be noticed. His relations with Comte and Comtism will make up a large part of the story of his life when it comes to be written. He was, though at no time a fanatic, a strong Democrat and Freethinker. Born as he was in the first year of the century when religion was almost banished from France, and when the Republic was still all in all to most of those who took an interest in politics, he was apparently brought up in the same principles, or the same lack of them. He translated Strauss's *Life of Jesus* very soon after it appeared, and for a time he threw himself with ardour into the Positive crusade. But, as every one knows who knows anything about Comte, the later lunacy of that philosopher were very far from satisfying M. Littré's cool and critical judgment. It was not by any means that his philosophy was purely negative, but that the fantastic follies of the later period seemed to him contemptible. He remained, therefore, both during the latest period of Comte's life, and after his death, the head of the philosophical as opposed to the religious Comtists, and most people whose duty or inclination has taken them in the way of the debates which have arisen on this question, have been

amused at the noble profusion of invective with which the fanatics of the latter party have poured on M. Littré and those who dared to oppose the new revelations. These invectives did not greatly disturb the lexicographer any more than the opposite invectives with which he was visited by the orthodox party, with Mgr. Dupanloup at its head. So long as the Empire lasted the Bishop succeeded in keeping his enemy out of the assembly, and it seemed likely that M. Littré would go down to posterity as one of the most illustrious occupants of the forty-first chair. In 1871, however, the tables were turned. M. Littré, as a strong Republican, had already been elected to the National Assembly, and he was admitted to the Academy by a large majority, against, it is true, two rather weak competitors. Thereupon Mgr. Dupanloup shook the dust off his feet and retired from the polluted halls. In estimating the conduct of the Bishop, to whom every credit for consistency and conscientiousness must be given, it should be remembered on M. Littré's side that his irreligion, such as it was, was of a purely speculative and unaggressive type, that he had never indulged in offensive language towards Christianity, and that the *odium theologicum* had never been understood to be entitled to penetrate the Academy. Four years afterwards M. Littré was elected a life senator.

The usual idle and somewhat disgusting controversy about the religious opinions of the dead man at his death has been stirred up in France, according to a bad fashion revived from the last century. It is at least amusing to find that the very persons who charge his relations with surreptitious conversion in *extremis* admit that in a former illness their own friends blockaded his sick room against the now victorious enemy. This odd method of maintaining thought in its freedom suggests St. Evremond's story of the generous philosopher who was on the point of blowing his free-thinking friend's brains out to save him from the disgrace of recanting. Whatever may be the truth of the case, which, of how-ever great importance it may be to the person principally concerned, is one as to which curiosity from outsiders is absolutely impertinent, it may be repeated that no one ever kept more aloof from the type of the aggressive enemy of religion and of Christianity than M. Littré.

This, however, let it be also repeated, is hardly the business of survivors to discuss. For those who come after him M. Littré will be an interesting exponent of a certain stage of the Positivist movement, no doubt. But his importance in this respect, like the importance of all commentators and expounders of systems of philosophy, will dwindle by degrees, and will become at last merely a subject of historical and antiquarian interest to specialists. So, too, his contributions to medical and scientific history will have their day and pass, as such things must. Science may be eternal, but each particular scientific expositor has the most precarious tenure of subjective immortality. It is otherwise with those who betake themselves to the more abiding fastnesses of literature. M. Littré's original compositions in this kind, if not of the first excellence, would be sufficient to give him a place, and an honourable one, in literary history. But his Dictionary is a claim of a very different kind. Done as it is, and at the particular time of its doing, it may be said to have been done once for all. It may be supplemented, corrected, rehandled perhaps, but—at any rate for some centuries, unless M. Zola succeeds in the task of abolishing the French language and substituting for it the *langue verte*—it will certainly not be superseded, and will even then form the basis of whatever it may be that supersedes it. Of the busy and brilliant generations among whom M. Littré passed his life of more than fourscore years there has hardly been another man who has so entirely given up his days to study, diverging into politics only as an occasional exercise, and never spending much time on active political business. Nor, perhaps, has there been another whose study has yielded such solid and nourishing fruit.

GEORGE STEPHENSON.

IT is a great misfortune that the whole subject of the history of the steam-engine and its inventors has for so long been in the hands of the picturesque bookmakers who, only wishing to manufacture amusing and romantic works, and being for the most part splendidly ignorant of science and mechanism, have devoted themselves to glorifying inventors and representing them to the world as a class of inspired prophets to whom direct revelations were made by accidents happening in their presence, which revelations they at once put into a practical form by the aid of an inspired genius. The result of all this tawdry, inaccurate writing is that when the real truth becomes generally known, there is a feeling excited in the popular mind that these inventors were not such very great men after all. Few men have suffered more from this over-praise in the wrong direction than George Stephenson. He is generally looked upon as the inventor of the locomotive engine in the sense that, at a time when locomotive engines were unknown, he actually thought out and made a carriage to run upon rails, propelled by steam. Now in this sense George Stephenson is perhaps hardly the inventor of the locomotive; and indeed what he did towards the actual construction of the historical "Rocket" was, setting aside the help he received from his son Robert, in strict technical language less the work of an inventor than of a "schemer," a schemer being a man to whom the outlines of an invention are given, his duty being to work out the practical details.

To justify our remarks we may shortly trace the history of the locomotive up to the time of the building of the "Rocket," confining ourselves to the high-pressure engine without condensers. In 1784—or three years after George Stephenson's birth—William Murdoch, a superintendent of Boulton and Watt's pumping engines in Cornwall, constructed a model of a high-pressure steam-carriage, but was prevented from carrying his invention any further by Watt's almost superstitious hatred and distrust of the high-pressure engine, together with his utter disbelief, in spite of his own designs in the same direction, of the practicability of steam locomotion, which is strongly shown in the following letter from Watt to Boulton, dated September 12, 1786, which we extract from a recent valuable work (*The Steam Engine and its Inventors: a Historical Sketch*. By Robert L. Galloway, Mining Engineer. London: Macmillan & Co.):—

I am extremely sorry that W[illiam] M[urdoch] still busies himself with the steam-carriage. In one of my specifications I have secured it as well as words could do it according to my ideas of it; and if to that you add Symington's and Sadler's patents, it can scarcely be patentable, even if free of the general specification in the Act of Parliament; for even granting that what I have done cannot secure it, yet it can act as prior invention against anybody else, and if it cannot be secured by patent, to what purpose should anybody labour at it? I have still the same opinions concerning it that I had; but to prevent as much as possible more fruitless argument about it, I have one of some size under hand, and am resolved to try if God will work a miracle in favour of these carriages. I shall in some future letter send you the words of my specification on that subject. In the meantime I wish W[illiam] could be brought to do as we do, to mind the business in hand, and let such as Symington and Sadler throw away their time and money hunting shadows.

Murdoch was also the inventor of the slide-valve, one of the most important details of the modern locomotive, and indeed of almost all kinds of steam engine.

Trevethick, in 1801, actually constructed a road carriage propelled by steam; and in 1804 constructed a locomotive to run on a tramway, which was used at Pen-y-Darran, South Wales, and in this engine he used a form of steam-blast, by which the steam in escaping, after doing its work in the engine, increased the draught through the fire; and in 1808 exhibited in London a locomotive drawing a carriage on a circular railroad. Later on Blenkinsop tried the plan of toothed wheels on the engine, and a rack cut on a rail, to enable the locomotive to go up steep gradients. Stephenson's attention was directed to the subject of steam locomotion about 1814, at which time several engines were in use on tramways in his neighbourhood; and he constructed an engine of the smooth-wheel type, which was tried on the Killingworth Railway with success. From this time he designed many locomotives, and soon abandoned the complicated gearing by which the motion of the piston-rod had hitherto been communicated to the driving wheels, and applied the connecting rods directly to them. Hackworth, in 1827, built the "Royal George," and for the first time applied the two connecting rods to the same pair of wheels. In 1828 M. Seguin, of the St. Etienne Railway, patented the multitubular boiler; and, later on, applied it with success to a locomotive which George Stephenson had built for him.

In 1829 came the great competitive trial of locomotive engines on the Liverpool and Manchester Railway, and for this George Stephenson, with great help from his son Robert, designed and built the "Rocket." In this engine the multitubular boiler was used, and the exhaust-pipe was narrowed at its mouth so as to increase the efficiency of the steam blast, and the cylinders were inclined instead of vertical. This locomotive not only fulfilled all the conditions of the trial but triumphantly beat all its competitors, and at once showed that the problem of steam locomotion on railways was solved.

Thus we see that the locomotive engine was not invented in the popular sense of the word by any one man, but was the result of a regular process of evolution, each man connected with its development adding some improvement, and to the Stephensons, father and son, can only be given the credit due to combining many known improvements in a very perfect way. But though George Stephenson had less to do with the actual invention of the locomotive engine than is popularly supposed, his real greatness is far beyond his modern reputation. As a mechanical engineer he had the quickness and readiness necessary to enable him to combine the isolated work of others into a practical scheme, which alone implies great grasp and power of mind. But further, at a time when steam locomotion was looked upon rather as a scientific curiosity, useful perhaps under certain circumstances, but useless if not harmful for general purposes, he had the foresight to see that a great new power had been given to the world which would soon change the habits and thoughts of all men. He had raised himself from the condition of a labourer to that of a skilled mechanical engineer without help, and purely by his own industry and cleverness; and now he became a reformer, almost a statesman, and it is this later development of his character which shows him to have been one of the world's great men. He fought prejudice even in Committees of the House of Commons, where he had to meet the opposition of men better educated than himself, and submit to the ordeal of cross-examination by the leaders of the Bar at a time when the license of cross-examination was far greater than it is now. But with mingled shrewdness and good temper he won his way, and did more for the establishment of our modern railway system than any man of his time. When ignorance and prejudice had been overcome he returned to professional work, and kept his place as the first railway engineer of his day in spite of all opposition. This he did by being one

of those able to lead and command. In his engine factories he had to make his workmen, and had but few machine tools to enable him to dispense with highly skilled labour; but yet he founded a business which has lasted to our time with a high reputation for excellence of work. Fortunately George Stephenson had a body strong enough to bear the wear and tear of his active brain. He tired out his assistants and subordinates by his enormous power of work, and, above all, by his complete indifference to sleep, two or three hours in a night sufficing to keep him in good health and in full possession of his mental activity.

And such a man as this runs the risk of having his reputation destroyed, because a certain class of writers have chosen to glorify him for things which he has not done and to ignore the things which he has done. For improved scientific and technical education has produced a necessity for better information, and the result is that writers of good technical and scientific knowledge have re-examined the old authorities, and have written books which, though perhaps not so "readable" as the old class of works, are of infinitely greater value, so that the truth is becoming known, and we fear that we may soon see that reaction of popular feeling set in to which we have referred before.

George Stephenson has another claim to honourable memory in his labours to lessen the dangers of coal-mining. Early in his career he devised a form of safety lamp, still known, we believe, amongst pitmen as the "Geordie"; and, not content with experimental trials, he actually took the lamp himself into dangerous parts of fiery mines, thus showing those qualities of courage and firm belief in his own powers which were the main instruments of his later triumphs. This invention formed the subject of one of those sad controversies which occur from time to time between rival inventors and their friends, between Stephenson and Sir Humphry Davy. In the end, priority of invention was conceded to Stephenson; but, in point of fact, the two lamps—the "Davy" and the "Geordie"—had such points of difference between them that each might well have stood upon its own merits.

STEAM-YACHT RACING.

AT the Nice International Regatta of March last a prize was given for steam-yachts, but though four very fine vessels—the *Amy*, the *Aline*, the *Fair Geraldine*, and the *Franziiska*—appeared to contend for it, the result of the race was not altogether satisfactory, as of the owners only one, to wit he who secured the prize, was satisfied—a state of things perhaps not altogether unprecedented in yacht races, but nevertheless much to be deplored. Lord Otho Fitzgerald, the owner of the *Fair Geraldine*, was the first to raise a wail. The *Franziiska* took the prize from him by time, and he complained in a letter to the *Field* that the time allowance was unfair, and, moreover, that the start was mismanaged. As, however, at the time of writing this letter he was apparently mistaken, both about the time he had to give the *Franziiska* and about the circumstances of the start, his protest failed, to say the least, to carry conviction, despite the fact of his having constructed for himself seventeen steamers, which he recorded with some pride. His letter had however one stirring result, as it evoked indignant remonstrances against the management of the race from the owners of the *Amy* and of the *Aline*. The first vessel, indeed, was singularly unfortunate. Her crew, it seems, had supplied themselves with tinned meat from the stores of one "Bobbly Joe," and, having eaten this bad substitute for the time-honoured salt junk on the morning of the race, were made extremely ill by it, so that the *Amy* had to give up the contest. Had she taken part in it, however, she would, in the opinion of her owner, have been at a great disadvantage, the time she had to allow the others being excessive. Those who settled it had not, in the opinion of this ill-used gentleman, taken into consideration the fact that the *Amy* had only auxiliary steam, while the others were full-powered steamers. The owner of the *Aline* was just as discontented as were those of the *Amy* and the *Fair Geraldine*. He considered that he had to allow more time than was fair to the last-named vessel and to the *Franziiska*. He also objected, as did the other two owners, to the smallness of the prize offered for steamers compared with that offered for sailing-vessels; and wound up by offering to race for 100 miles without any time allowance for horse power. This condition might not possibly be objected to; but it would be hard to find fault with the owner of the *Aline* for suggesting it, as he was clearly smarting under a sense of injustice; and, indeed, the principal result of the offer of a prize for steamers at Nice seems to have been to fill the minds of three estimable gentlemen with wrath and discontent.

We doubt not that by this time they are appeased, and that the sinning Nice Committee is forgiven, as the correspondence in which their woes were recorded took place long ago. We should not have referred to it now had it not been that it seems to have had some effect in awakening the idea of steam-yacht races, and that it shows very clearly an initial difficulty which will be found in settling the conditions of such matches. Some three or four weeks after the last of the complainant's letters appeared, Mr. Dixon Kemp, so well known as a writer on yachts and on the principles of designing, took up the subject of steam races in the *Field*, and he has since treated it again; while another writer in the same journal has begun an elementary description of the modern

marine steam-engine. We have frequently borne testimony in these columns to the excellence of Mr. Dixon Kemp's works and to his thorough acquaintance with the subjects to which he has devoted himself, and we much regret to differ from him; but, with regard to steam-yacht racing, we cannot but think him mistaken. He is strongly of opinion that such races are desirable, for he says in his second article that, with a fleet of four hundred steam-yachts, there is plenty of material for racing, and that the contests would prove not only interesting but highly instructive. Some instruction might no doubt be obtained, but the same instruction could be much better obtained without any contests at all. This we will presently endeavour to show, but it will be best first to consider the manner in which Mr. Dixon Kemp proposes to settle the conditions of these races. It has been seen that the owners of three of the four steam-yachts at Nice considered the time allowance most unfair, and it is obvious that fixing the allowance for steamers must be a much harder matter than fixing it for sailing-vessels, as both power and size have to be taken into consideration. Seeing what difficulty there has been about the simpler kind of time allowance, the arrangement of the more complex one would seem likely to prove troublesome in the extreme; but Mr. Dixon Kemp is quite ready with a method. He begins, of course, with measurement, and, considering the animated controversy which has been recently raging over his rule for measuring sailing-yachts, it certainly shows no small courage to propose a plan for measuring steamers with a view to competitive trials. This, however, Mr. Kemp does without hesitation. He does not, rightly enough, think either the Thames rule or the rule recently proposed applicable to steamers, but suggests displacement as the only proper measurement, and with this suggestion few who have any knowledge of the subject are likely to quarrel. Mr. Kemp's method of finding the displacement is, however, open to criticism. The length from stem to sternpost, the "mean breadth" and mean height of freeboard, are to be multiplied together, and then divided by 100. The quotient, together with "any closed in deck spaces or poop," is to be deducted from the gross register tonnage, and the remainder, multiplied by 1.0 and divided by 35, will, with an easily calculated addition for frames and thickness of planking, give the displacement in tons. No doubt this is a very good rough and ready method, but it is only a rough and ready method somewhat vaguely stated, and is subject to error. It would never be acquiesced in for competitive steaming, as every yacht-owner who failed to win prizes would set to work to show how badly it applied, and would have ample opportunities for criticism. It would be far better to take simply the gross register tonnage than an approximate displacement. The real displacement, accurately ascertained, would, no doubt, be the proper tonnage for competitive sailing, but there are sometimes peculiar difficulties in the way of verifying the displacement of a yacht. Mr. Dixon Kemp's method of determining the horse-power is also, as he candidly admits, approximate, and gives in some cases very erroneous results, so that it could never be accepted for fixing the conditions of contests. Indicated horse-power alone could be relied on.

In *limine*, therefore, are two difficulties which Mr. Kemp, despite his thorough knowledge of the subject, does not seem to have overcome. The main principle, however, which he lays down for settling time allowance certainly appears to be the right one. The test of merit, he says, ought to be "the largest displacement moved with the greatest speed by any given steam power." He will be a bold man who endeavours to dispute this *dictum* and he will also be a bold man who endeavours to arrange a system of time allowance to be understood of all, with this principle for a basis. Mr. Dixon Kemp proposes a plan which we have not now space to treat in detail, but which we hope to consider at length in a future article, as the mathematics are interesting. We may observe, however, that amongst other objections to his plan there is the important one that in too many cases sailing or rather steaming Committees and secretaries of clubs would be greatly puzzled to understand the reasoning on which it is based. The articles of Mr. Dixon Kemp's colleague "Helix" show that he considers very elementary instruction necessary for yachtsmen. The rule, however, in which Mr. Dixon Kemp's calculations result is simple enough. The difference between the theoretical, or, to speak more accurately, hypothetical speed of any two yachts over a given length constitutes the time allowance. This, no doubt, seems a good rule, but we venture to say that, if steam-yacht races became frequent, many would be the complaints of owners about the hypothetical speed assigned to their vessels. As just said, however, we have not now space to enter into the mathematical portion of the question. It is sufficient to say that in the system set forth by Mr. Dixon Kemp in his two articles there are sources of error that would lend, if that system were adopted, to wrangling almost as bad as that which has continued for so long over the Thames rule of measurement.

As has been shown, the race at Nice gave rise at once to indignant remonstrances about the time allowed to the winner and to the *Fair Geraldine*, and if a man of Mr. Dixon Kemp's exceptional knowledge is not able to devise a thoroughly satisfactory method of calculating what should be given and taken by steamers, it may fairly be assumed that this question of time allowance which is sure to give rise to such strong feeling is a very difficult one and not likely to be easily settled. Even, however, if it is settled, and if a system to which no legitimate objection can be taken is elaborated, it will still be most doubtful whether steam-yacht racing is a desirable addition to the national sports. Very possibly,

as Mr. Dixon Kemp says, some instruction will be obtained from the contests of steamers; but the same instruction can be obtained from ordinary trials, and is indeed obtained from them every day. A steamship Company does not want to race one of its vessels against another in order to ascertain merits and defects; and it is to be observed that ordinary trials, being made simply for the purpose of acquiring knowledge of the engines, speed, &c., will give results far more trustworthy than those of trials made in all the heat and excitement of contest. Then, surely, steam-yacht races will be the very duller races that can possibly be seen. In most cases the vessels will, within a short time after the start, be arranged in the precise order in which they will arrive, and often the race will be nothing but a gradual lengthening of the spaces between them. Any one who witnessed the latter part of the race between the *Vandua* and *Fornosa* in the Royal Thames match last year, which, however satisfactory to the men of the *Vandua*, was uninteresting and most wearisome to spectators, will be able, we should say, to form a very good idea of what a steam-yacht race will be like. Mr. Dixon Kemp himself admits that, as a picturesque spectacle, such a race will be less interesting than a contest between sailing vessels, and in another respect it will be very far inferior. There will be no opportunity for the display of the good seamanship endeared by the noblest associations to Englishmen. Moreover, steam races will, if they become common, present scarcely more interest than is offered by a sum in addition and subtraction. (Often it will be easy to foretell the result with all but absolute certainty. The speed of a steamship, in smooth water and with a light breeze in her favour or a light breeze against her, is commonly known with great exactness by those who have to do with her; and, if matches between steam yachts grow frequent, the owners of racing vessels will know very accurately the speed of their rivals. Steamships are not driven hither and thither as sailing vessels are, but steer direct courses, so that the precise distances they have to cover can be ascertained. Frequently, therefore, on the morning of a race, the owner of a yacht, by working a very short and easy sum, will be able to discover the intervals which will separate the vessels at the end of the contest; and then, by referring to time allowance, he will find out whether he is to be winner of a prize or not. What possible interest there can be in such races it is hard to see, and we trust that for once the advice of Mr. Dixon Kemp, often so valuable, will pass unheeded, and that we shall not be afflicted with what may prove to be merely ostentatious exhibitions of wealth.

TRADE PROSPECTS.

THE effects upon trade of the severe weather of the early part of the year are at length passing away, and evidences are accumulating that once more a decided improvement is setting in. The Board of Trade returns for May, which were issued on Wednesday, show a marked increase both in the imports and the exports. The exports for the month exhibit an increase of about 10½ per cent. over those for May of last year, and even for the first five months of the year there is an increase of over 1½ million sterling. In the imports the increase is about 7½ per cent. for the month, while for the five months there is a decrease of about 5 millions. From these figures it appears clear that what we have been witnessing since January is not an actual decrease, but only a check, due in large measure to the severity of the weather. To recur to the exports, it appears that even for the five months, while there were such great complaints of loss of business, there is an actual and very considerable increase in the value of the goods sent abroad. The truth appears to be that at the beginning of the year over sanguine expectations were entertained as regards the future. The revival had then lasted nearly a year and a half, and it was assuming such considerable proportions that it was hoped the present year would witness a still greater expansion of trade. When, instead, there was stationariness, or at best but a very slight increase, and when prices fell away, the disappointment was so great that what was only a temporary check was regarded as a serious decrease. In April, indeed, there was an actual diminution in the exports; but this was the only month of the five in which the volume of trade was smaller compared with 1880, a year of admittedly good business; and the marked increase which occurred in May shows that this was due chiefly to the Easter holidays and to bad weather. Another most encouraging feature of the returns is that the increase in the exports is very general. A larger value was sold to our foreign customers of cotton manufactures and cotton yarn, of linen manufactures and linen yarn, of jute manufactures, of silk and silk manufactures, of tin, lead, and copper, of hardware, haberdashery, chemicals, and apparel. The only two important articles which show a decrease as compared with May 1880 are woollen goods and iron. In woollen yarns and also in woollen manufactures there is a falling off; but certain kinds of woollen manufactures—as, for example, woollen cloths—show an increase. It is in blankets, flannels, and carpets that the falling off occurs. As regards iron, again, the decrease is entirely in the exports to the United States. Railway construction in the United States assumed such enormous proportions in the end of 1879 and the beginning of 1880, that the trade at home was unable to meet the demand, and consequently large purchases had to be made in Europe. The rise of prices, however, gave such a

stimulus to the native supply that the demand for European iron came to an end in the middle of last year. But, with the exception of the United States, the demand fully keeps up, and in many quarters is considerably increased. The falling off occurs in old and pig iron, in tin-plates, bars, angles, and hoops; whereas there is an increase in steel and in railroad iron, a very large one indeed in rails; and there is likewise an increase in wires, and in cast and wrought iron. There is, moreover, an increased export of telegraph wires, and of millwork and machinery. It is quite clear from this that our foreign customers generally are augmenting their purchases of iron from us, and that though the process is slow, it may be expected before very long to overtake the supply and cause a rise of prices. As regards the imports there is an increase in some of the raw materials of manufacture, and also in some of the articles of food. Amongst the former we find wool, silk, hemp, and copper imported in larger quantities, and also unrefined sugar. But woollen yarn, raw silk, flax hides, and raw cotton have fallen off. Tea, wheat, maize, and wheat-flour show increases; while wine, coffee, butter, cheese, and living animals show decreases.

The evidences of improved trade are not confined to the imports and the exports. There are unquestionable signs of a very large business being done at home also. For example, the railway traffic returns for the first three months of the present year show decreases in the earnings from goods traffic on eleven out of the thirteen weeks. In April, however, there was a change, and the increases began to outweigh the decreases. In May this change became more accentuated. In the two last weeks of that month, for instance, the increases in the receipts from goods amounted to 79,000*l.* and 65,000*l.* respectively, the result being that on seventeen selected railways of the United Kingdom the goods receipts show for the first five months of the year an increase of 42,000*l.* In these seventeen Companies are included some of the Scotch and Irish, which exaggerate the loss of traffic. If we were to confine our observations to English lines alone, the gain from goods traffic would be still more considerable. It is evident from this that the amount of trade being done this year is considerably larger than it was last year. Prices now, it is true, are lower than they were then, and profits consequently may not be quite as good. But, at the same time, the profits must be considerable. At any rate, there is a very large trade going on, and this trade is rapidly expanding. It was checked, as we have already said, and, as is shown very markedly by the railway traffic returns, in the first three months of the year; but during the last two months it has been again increasing, and is now assuming very large proportions, the returns for the present week in particular being exceptionally satisfactory. The returns of the London Bankers' Clearing House equally afford evidence of the increase of trade. During the month of May alone the amount cleared exceeded 500 millions, the increase being about 11 per cent. as compared with the corresponding month of last year. And three-fifths of this increase was from legitimate business, the increase on Stock Exchange settling days being only about two-fifths. In other words, not more than two-fifths of the increase, at the outside, can be set down to speculation, the remaining three-fifths being due to the growth of legitimate business. Upon the 4th of the month, when trade bills are cleared, the increase was about 5 per cent. Lastly, the revenue is also becoming more productive. It is too soon to attach much importance to this fact, and it is, besides, difficult to institute an accurate comparison, on account of the changes in taxation made by Mr. Gladstone. But, so far as the Revenue returns go for the month of May, they undoubtedly show an elasticity which for some time has been wanting. The evidence thus afforded by statistics is confirmed by the market reports and trade circulars. There is a much more encouraging tone about these than was observable when we last wrote upon the subject. Bankers, too, although they still complain of scarcity of bills, are agreed that trade is much better than it was in the spring. Altogether, in short, there is a more hopeful spirit than there was a little time ago. As regards the scarcity of bills, of which bankers complain, and which has been adduced as evidence of the slackness of trade, it is due in large measure, we are inclined to think, to the fact that trade is now conducted upon sounder principles than it was some time ago. Partly because prices are lower, and partly because the unhealthy credit that used to be allowed is not now extended, business is carried on on a ready-money basis much more largely than it formerly was. Besides, the extension of the telegraph to all parts of the world enables business to be conducted in a manner which was not possible formerly, and thus dispenses with the manufacture of bills to a very large extent.

Upon the whole, then, there cannot be any doubt that trade is improving, and is likely to improve. The great cheapness of money is as advantageous to trade as it is favourable to speculation. When money is so abundant, and can be had on such moderate terms, people are encouraged to go into enterprises which they would not embark upon if there was any difficulty in obtaining accommodation. The extreme lowness of wages is equally favourable, since it enables manufacturers and merchants to sell at moderate prices, and thus tempt custom, whilst low prices themselves are favourable both to the manufacturer and to the consumer. The great point now, however, is the coming harvest. If the weather continues favourable, and the crops are good, there is every reason to hope that trade will continue to improve and will expand rapidly in the autumn. If, on the other hand, we are to have another bad harvest, the consequences must be serious, and the improvement of trade, if not stopped, must be seriously checked.

The one unfavourable circumstance at present is the poverty of the agricultural classes. Landlords and tenants alike are unable to spend as they used to do, and the small towns throughout the country suffer, therefore, not only from the loss of the custom of their agricultural neighbours, but also from the difficulty these have in paying their debts. A good harvest would put both landlords and tenants in funds, and, what is quite as important, it would give them new hope and new courage. They would feel that the doom of British agriculture had not yet come; that it was worth while to go on struggling against foreign competition; and that, if they were only blessed with a few good years, they would be still able to hold their own, and, perhaps, be as well off as ever they were.

THE PICTURE GALLERIES.

v.

SUBSEQUENT visits to the exhibition of the Royal Academy do but confirm the impression of disappointment—one may say even of amazement—first aroused by the “tricks and manners” of the Hanging Committee. It is bad enough in ordinary years to have work of the kind that Mr. Frith delights in staring one perforce in the face. This year, not only is this evil intensified to a terrible degree, but, as we have before had occasion to remark, the juxtaposition of the majority of the pictures has the air of being arranged with a view to injuring their effect. Again, it might be said by way of not unpardonable exaggeration, that, while all the least satisfactory pictures of this year may readily be appreciated by a dwarf, many of the most artistic works can only be seen either by a giant or by a person armed with “one of those long sliding opera-glasses that they call tallow-scoops.”

In Gallery No. II. re-examination of Signor Gaetano Obericci's “A Frightful State of Things” (71), while it cannot but increase admiration for the perfect humour and originality of the picture, as well as for the care and skill bestowed upon the details, yet reveals one or two trifling shortcomings. For instance, the baby is smaller than the goose, and the fire seems to be in the same plane with the table. In Mr. Long's large picture “Diana or Ohrist” (97) “the scene is the stadium of Ephesus, with Roman rulers sitting in judgment.” In the foreground a little to the right a maiden is being besought by her lover, who stands immediately behind her, clasping and seeking to guide her hand, to throw upon the altar of Diana the one grain of incense which will set her free. If Mr. Long has failed in rising to the full height of the occasion he has set himself to portray, it is in the face of the maiden herself rather than in the faces of the bystanders. These, indeed, are full of finely imagined character and expression. Most of them wear, according to their different temperaments, an aspect conveying some sort of pity for the fate to which the determined and beautiful girl seems doomed. The grim figure of the negro who stands on the spectator's right with his silver ornaments showing against his black skin alone seems unmoved. The work has many high qualities of technique and composition, but perhaps the crowd in the middle distance is a little awkwardly massed. As a complete model in this room of what a portrait should not be, we may point to No. 108, by Mr. Horsley. Returning to Mr. S. E. Waller's capital and spirited “Success” (81), we become impressed with a notion that the carriage which is waiting to carry off the unhappy victor is of gigantic proportions. We have to notice for the first time Mr. J. S. Noble's splendid portrait of a dog, called “In the Lap of Luxury” (77). We may also call attention to Mr. W. J. Hennessy's bright and pleasant Normandy scene (123), to M. Graef's fine portrait of Mrs. Alfred Cock (133), and to three very clever little bits of landscape by Mr. Baker (134-136). It is scarcely necessary to dwell on the merits of Mr. Pettie's “Her Grace” (112), a study in white drapery, which recalls the achievements of the Dutch school.

In Gallery No. III. Mr. Cecil Lawson's really beautiful landscape, “Barden Moore, Yorkshire” (167), the least good part of which is the clouds, is to a certain extent injured in effect by being hung directly over a work by Mr. Ansdell, which is a mass of white mules and goats. It is not easy to imagine why Mr. Poynter should have thought it worth while to paint the picture numbered 198. To hang it was an obvious mistake, and to call it “Helen” was an outrageous absurdity. This, however, may pass unnoticed by many spectators, if one may judge from the authentic story of the visitor who was heard lamenting that a portrait should be indicated only by a Christian name. In No. 208, “Il dolce far niente,” Mr. Yeames has produced a shameless “crib” from Mr. Alma-Tadema, which, however, is singularly ill drawn and ill painted. Mr. H. M. Page shows a good study of flowers and a peacock under the title “Rival Beauties” (212). At Mr. Alma-Tadema's exquisite “Sappho” (269) one could never tire of looking. Mr. Hook's “Diamond Merchants, Cornwall” (258), is an unpleasing work, in which the water wants transparency, and the colour is far from attractive. Mr. John Collier's fine picture “The Last Voyage of Henry Hudson” (260) is a work that grows upon one. “Henry Hudson,” the catalogue says, “the great navigator, made his last voyage to the Polar Seas in 1610. In the summer of 1611 his crew mutinied, and set him adrift in an open boat, with his son, John Hudson, and some of the most inferior of the sailors. They were never heard of more.” Mr. Collier shows us in illustration of this the stern half of an open boat, the helm of

which is grasped by Hudson. Resting against his knees is the drooping and half-fainting figure of his son, while in the foreground there lies leaning against the starboard side of the boat one of the infirm sailors above referred to. The background is occupied by part of an iceberg, a stretch of grey water, and a rocky and ice-bound shore. On the spectator's left a floe of drift ice seems to threaten the doomed boat. All these details are worked out with much skill, thought, and mastery; but the dramatic interest centres naturally in the face and figure of Hudson himself, in the treatment of which the painter has in a marked degree combined strength with refinement. The mixture of courage and despair in the face of the old man is very striking. It might be possible to cavil at the air of too great freshness which seems to belong to the very well painted drapery; but it would be absurd to dwell upon such a fault, if fault it is, in a work which is powerful in itself, and which shows a great advance in the painter's command of his art.

From certain qualities found in his portrait of Mr. Matthew Arnold (156), it would seem that Mr. Watts is becoming an impressionist or an independent. Anything like close examination of this work reveals the surprising fact that, if Mr. Watts is right, his sitter's hair is of a deep, striking green colour, which is especially noticeable at the back of the neck, where at one spot green pigment has been laid on with a munificent thickness. It is less astonishing to find blue whites to the eyes, for that what we call the whites of people's eyes are really of a distinct and ethereal blue is clearly, to judge from other pictures, an established belief with Mr. Watts. In the same way a blue shirtcollar may go for comparatively little; but it is rather too bad to find the flesh tints laid on apparently with a palette knife, the result of which method is naturally an almost complete loss of form. Mr. Watts's creed as to green hair seems to be shared by Mr. Walter Horsley, who, in "In Time of Need" (30), in the first gallery, a work by no means without merit, has given distinctly green beards to the men. Mr. Dicksee's "The Symbol" (175), with the motto "Is it nothing to you, all ye that pass by?" has, as we have on a former occasion observed, considerable beauty of colouring; but the choice of the subject is perhaps hardly fortunate with regard to the importance aimed at by the work. The more incident of a mediæval Italian beggar holding up a crucifix to a procession of laughing young men and maidens, who troop gaily by him, is hardly enough to support a picture of the pretensions of Mr. Dicksee's, however clever the execution of the work may be. It is, of course, possible that the painter has intended to charge the picture with a deeper significance than we have been able to detect in it.

In the fourth gallery we have Mr. Andrew Gow's "Montrose at Killyth" (311), showing the moment when Montrose "threw off his doublet saying, 'The cowardly rascals durst not face us till they are cased in iron; to show our contempt of them, let us fight them in our shirts'; so by that resolution to strike terror into the enemy, and to let them know they were resolved either to conquer or die." The picture is full of life and animation, and will add to the high repute in which Mr. Gow has been for some time past held. Mr. O. Green's "A Choico Vintage" (327) is a small genre picture possessing a great deal of humour. It would be difficult to praise too highly Mr. Henry Wood's "The Gondolier's Courtship" (334), a picture which grows upon one by repeated inspection. In the fifth gallery we have already expressed our admiration of Mr. Boughton's charming picture of "A Dead City of the Zuyder Zee; the Town of Hoorn, North Holland" (374). In Mr. P. R. Morris's "The Queen's Shilling" (408), the villagers have a disappointingly theatrical air. Next to this hangs a true and careful portrait of Sir Philip Protheroe Smith (409), by Mr. Sydney Hodges; and we may at the same time mention a clever portrait by Mr. C. W. Mitchell of "C. Mitchell, Esq." (423).

The sixth gallery is chiefly remarkable for containing Mr. Brett's splendid work "Golden Prospects" (145). In this Mr. Brett shows us once again the combined charm of atmosphere, space, and sunlight which distinguished his well-known picture of the Channel Islands a few years ago. Miss Clara Montalba's "St. Mark's, Venice; the Piazza Inundated" (453) is perhaps more striking and effective than true to nature. There is a decided charm about Mr. Prinsep's "The Palace on the Lake" (452); and Mr. Keeley Halswelle's "After Rain" (459) is a fine Thames study, unhappily disfigured by impossible clouds. Of some important works in the seventh room we have already spoken; but it is a pleasure to recur to such a picture as Mr. Van Haanen's "Washerwomen, Venice" (589), which is one of the best drawn and best painted pictures that have been seen for a long time.

THE OAKS.

IN former years the day of the Oaks used to be considered the pleasantest of the Epsom week, and much was said and written about its comparative quiet and peacefulness. It is still true that the crowds are far smaller on the Oaks than on the Derby Day; but even on the Oaks day there are swarms of ruffians about the Grand Stand that make an attendance at what has been termed the ladies' race anything but an occasion of repose and tranquillity. The ground on the course itself, and on either side of it, is naturally more covered with orange-peel, corks, straw, and pieces of paper on the last day of the Epsom meeting

than on any other; and even the breezes on the Downs do not seem to dispel the general atmosphere of over-heated humanity, dust, ham sandwiches, and bad tobacco which has made Epsom racecourse horrible for four successive days.

All lovers of racing ought to regret that Lord Falmouth's filly Bal Gal became a rover. She was certainly the best two-year-old last year, and, if she had remained sound, both the Derby and the Oaks would probably have been at her mercy. After possessing such mares as Jaunette and Wheel of Fortune, which won the Oaks in 1878 and 1879, her owner can hardly complain, and Bal Gal herself is not much in his debt, as she won more than 10,000*l.* last year in stakes alone; yet, in looking back on the Oaks of 1881, one cannot but regret that the best filly should have been prevented by infirmity from winning it. It is, however, useless to lament over the inevitable; and, as Bal Gal was proved incapable of winning the Oaks, it became necessary to choose another favourite. There was not much difficulty in doing this. Mr. Crawford's Thebais, a chestnut filly by Hermit out of Devotion, had won ten races out of twelve last year, and her winnings as a two-year-old had exceeded 5,000*l.* She had begun by running a miserable third to Scobell, in a race at Stockbridge last June. Her next performance had been to run nowhere to Bal Gal in the July Stakes at Newmarket. Then she began her winning career in the Ham Stakes at Goodwood; after which she never lost a race during the remainder of the season. Nevertheless, her performances were scarcely so brilliant as might at first sight appear. Three of her ten victories had been walks over, and in three more she had only been opposed by one other horse. In the Ham Stakes the best horse she had beaten had been Amber Witch. In the Triennial Stakes, at Newmarket, she had beaten thirteen opponents, of which Lennoxlove was second and Kulleborn was third. Lennoxlove had won the Great Yorkshire Foal Stakes in the spring, but he was afterwards beaten very often. In her last race Thebais beat Lennoxlove again. Her only other two-year-old race was the Criterion, and this was really an important affair. She was giving from 1 lb. to 5 lbs. to each of her eight adversaries. She won the race over the severe course with great ease by a length and a half, Savoyard being second and Sir Marmaduke third. This was a good performance, but still it could hardly be said that she had ever beaten any two-year-olds of the first class. This spring she was made first favourite for the One Thousand, and she won the race very cleverly by a neck; but she had to gallop to beat Thora, who had a little the best of it as they came out of the dip. Bal Gal, Angelina, the winner of the Woodcote Stakes at Epsom, Wandering Nun, Lucy Glitters, and other fillies which had shown form last year, were among the defeated. Lucy Glitters had been third in the Middle Park Plate, the Dewhurst Plate, and the Tattersall Sale Stakes at Doncaster. She had also been second in the North of England Biennial at York. In the Dewhurst Plate she had run within a length of Bal Gal. Thora had won the Troy Stakes and the Exeter Stakes, and, like Wandering Nun, she had been one of the five two-year-olds that had come in almost abreast for the Ashley Stakes at Lewes. She had run this season in the City and Suburban Stakes, but she was not placed for that race. In our notice of the Derby, we observed that she had been beaten with extraordinary ease by Geologist in the Criterion Nursery; the miserable running of Geologist in the Derby, therefore, seemed to show that Thora must be far below the first class of racehorses. Among the unplaced fillies in the One Thousand was Lord Rosebery's Myra, a chestnut filly by Doncaster out of Czarina. Although she ran badly, it was thought that she would improve considerably by the Oaks Day. Last year she was often beaten, but she won the Rous Plate at Doncaster and the Second Nursery Stakes at the Newmarket First October Meeting. Another filly that won a couple of races last year, and was beaten in the One Thousand, was Metcorm, by Thunderbolt.

A dozen fillies went to the post, and they were soon off. A mare belonging to the same owner as Thebais made the running early in the race. At the mile-post Caper Sauce, the third favourite, took the lead. Half way down the hill Thebais, who had been in a good position throughout the race, drew near the leaders. When they came into the straight Caper Sauce was beaten, and her stable companion, Lucy Glitters, took the lead from her. As they passed the road Lucy Glitters was quite two lengths in front of Thebais, but presently her jockey was hard at work with his whip, and she was evidently tiring. Fordham then brought Thebais forward without any trouble, and, passing Lucy Glitters, won the race by three lengths in a canter. Myra was a very bad third. Whatever may be said against the appearance of the winner of the Derby, there can be little doubt that Thebais is almost, if not quite, as good-looking as any filly that ever won the Oaks. She is rather inbred, as her sire, Hermit, is by Newminster, who was by Touchstone, while her dam was out of Alceatis, who was by Touchstone. Yet, if she must needs be inbred, she could scarcely be inbred to a better horse than Touchstone; and, after all, inbreeding often answers well with racehorses.

There was some other racing at Epsom which deserves comment. Only five two-year-olds came out for the Woodcote Stakes. This was a terrible falling-off from the fields for this race in former years. Indeed nineteen years have passed since so few horses went to the post for it. The first favourite won by a neck only. He is a bay colt called Dunmore, by Scottish Chief out of Czarina by King Tom. He won the Mostyn Stakes at the late Chester meeting. Purple and Scarlet, who was second, had also won a race previously. The Epsom Stakes was won by Petronel, the

winner of the Two Thousand Guineas of 1880. The Thursday, which used to be an off day, was enlivened last week by an important new race called the Epsom Grand Prize. This stake consists of 1,000 sovereigns for the winner, and 200 for the breeder of the winner, added to a sweepstakes of 25 sovereigns each, for three-year-olds, the distance being a mile and a quarter. On this occasion the race was worth 4,562l. There are certain penalties and allowances. Ishmael and Lord Bradford's colt by Wenlock out of Zephyr, were the first and second favourites. They had each 8 st. 3 lbs. to carry. The third favourite was Scobell, who had run in the Derby on the previous day. This horse was giving each of the two leading favourites a stone. The Zephyr colt made the running, but, as they came to the bottom of the hill, he lost his position. Voluptuary gained the lead as they crossed the road. It may be remembered that this horse led for a few moments in the Derby at much the same part of the race. When they were fairly in the straight Scobell came up, and as they passed the distance he shot forward. Ishmael and Count de Lagrange's Leon made a great rush as they drew near to the winning-post; but Scobell gallantly responded to their challenge, and, holding his own, won, after a good race, by half a length. Ishmael was three-quarters of a length in advance of Leon. This performance of Scobell's, considering his hard race in the Derby of the previous day and his extra weight of 14 lbs., seemed to show that the leading horses in the Derby must, after all, be of a better class than was at first supposed. We must now notice a race which far exceeded the Oaks in interest, and, we might also add, the Derby also. This was the Epsom Gold Cup, which followed the Oaks on Friday afternoon. Only two horses were saddled for this race, but these were Robert the Devil and Bend Or. It is needless that we should recapitulate the famous contests between these two great champions of the racing season of 1880. It will be sufficient to remember that Bend Or beat Robert the Devil by a head for the Derby, and that in each of their three subsequent battles—including the St. Leger—Robert the Devil was victorious. The pair were now to meet for the first time as four-year-olds, at even weights, over the course on which Bend Or had been the winner. Robert the Devil was a decided favourite at 6 to 4, and this state of the betting seemed reasonable enough. There was immense excitement as the two horses came out to take their preliminary canter, and it was generally considered that Bend Or seemed to move better over the hard ground. When they left the starting-post, Bend Or was off a little quicker than the other horse, but Archer kept him back, and Robert the Devil got away three lengths in advance. At the top of the hill Bend Or drew nearer to his opponent, but Cannon sent Robert the Devil on faster, and again led by about three lengths. Coming down the hill Bend Or drew nearer again, and as they came round Tattenham Corner there was only about a length between them. When they entered the straight it became a closer race, but Robert the Devil was still leading. Very near home the favourite still held his advantage, but Cannon had to ride him resolutely, and Bend Or soon closed up with him. Opposite the reserved enclosure Cannon had to raise his whip, and then Archer roused Bend Or, who darted forward very gamely, got on even terms with Robert the Devil, and on the post had his neck in front of his adversary's nose. It is generally believed that Bend Or could have won by a greater distance; but, be that as it may, it was a beautiful race. Upon the whole, the late Epsom meeting was a decided success, and the weather was, if possible, even too fine.

REVIEWS.

ANCIENT BRONZE.*

MR. EVANS'S new work on the bronze implements of our country is marked by the research, carefulness, and moderation of tone to which his other writings have accustomed us. Nothing can be better than the methods and the copious illustrations of his new volume. It is much easier, and more profitable, to give a summary of the results of Mr. Evans's inquiries than to attempt to criticize a work so accomplished. One or two critical remarks, however, we may venture to make on passages where Mr. Evans's studies border on literature or on ethnology. Thus (p. 6) Mr. Evans mentions M. Mariette's opinion that "the early Egyptians never really made use of iron, and he seems to think that from some mythological cause that metal was regarded as the bones of Typho, and was the object of a certain aversion." Now Mr. Evans (p. 8) remarks that in his opinion iron was only called the "bones of Typho in contrast to the bone of Horus"—that is, the loadstone—"and it seems difficult to admit any great antiquity for the appellation." This is where we differ from Mr. Evans, and, as the topic is comparatively new, we proceed to give our reasons for thinking "bone of Horus" and "bone of Typho" very old appellations for the metals. If we examine the cosmogonies of savage or of civilized races, we find that the earth, as a rule, is thought to have grown out of some original matter, perhaps an animal, perhaps an egg which floated on the water, perhaps a

handful of mud. But these conceptions do not exclude the idea that many of the things in the world—minerals, plants, and what not—are fragments of the frame of a semi-supernatural being, belonging to a race which preceded the advent of ordinary men. Such beings were the giant Ymer in Scandinavian mythology.

From Ymer's body
Earth was created;
From his blood the sea,
Plants from his hair;

and so forth. Another example is the giantess Omoroca, of Chaldean cosmogony, whom Bel cut in twain, and whose body he fashioned into heaven and earth. In Mangaia, tufa stones are "the bones of Ru," a supernatural early being. Among the Greeks, pomegranates and other fruits were the blood of the dismembered God, Dionysus Zagreus. And, in the opinion of the Red Indians, flints are the scattered bones of a primitive Titanic being, named Chokanipok, who was dismembered by Manabosho. Typho and Horus are conceptions like Ymer, Ru, Chokanipok, Omoroca, Dionysus Zagreus, and the rest. As this sort of myth among civilized races is manifestly an inheritance from savagery, it seems to follow that the name "bone of Typho" for iron is really very ancient and derived from a very early stage of thought. As to iron among the undivided Aryans, Mr. Evans observes that in 1864 Mr. Max Müller thought that it was probably unknown. But in his *Selected Essays* (i. 348) Mr. Müller says "there can be no doubt that iron was known and its value appreciated." In a note, however, he expresses a doubt as to whether we can say more than that the Aryans had a metal which was neither gold nor silver. The question is interesting, because it appears from Mr. Evans's book that, if the ancestors of the early Celts knew the use of iron, their descendants lost the knowledge on the way to Britain.

Mr. Evans's general views as to the date of what is called the Bronze Age in Britain may be briefly stated before we go on to examine the process by which the various weapons were evolved. He thinks, "with all reserve," that the age in which bronze had, for most purposes, superseded stone, and had not yet given way to iron, lasted for eight hundred or for a thousand years. Iron probably came into use in the southern parts of Britain not later than the fourth or fifth century B.C., and by the second or third century B.C. the employment of bronze for cutting instruments had practically ceased. Thus the Bronze Period in Britain may have begun about 1400 B.C. The probability is that bronze was introduced by a hostile conquering people, bigger and larger of bone than the stone-using people whose remains are found with flint knives, arrow-heads, and axes in the barrows. But this invasion must have been even earlier than 1400 B.C., if we hold with Sir John Lubbock that the Phœnicians dealt with British miners between 1500 B.C. and 1200 B.C. For it is excessively unlikely that the Phœnicians discovered our tin mines; and if the natives of our islands were the discoverers, the odds are that they used the tin for mixing with the copper of the same regions in the manufacture of bronze.

Without pausing over Mr. Evans's confutation of Mr. Gladstone's theory of iron in heroic Greece (and for our own part we believe that it was still more common than Mr. Evans supposes), we go on to examine the probable evolution of various forms of "celts," or bronze tomahawks. In the evolution of objects of human manufacture it is the rule that when a new material for an old article is introduced, the shape of the article continues much what it used to be, while its less necessary parts generally degenerate into mere ornament. The ornaments of Lycian stone tombs, for example, are the survivals of necessary parts of the wooden structures which were common before stone was applied to the purpose. In very much the same way the characteristics of the celt, or bronze axe, were probably evolved. The old stone axe had been a thin, flat blade, probably stuck into the cleft of a stick, and fastened there with string or the sinews of animals. When bronze began to be used, the bronze tomahawk heads imitated the shape of the old flat stone heads. Mr. Evans gives a figure of a very old flat bronze or copper celt from Cyprus. Another comes from Butterwick, in the East Riding of Yorkshire. The handle of this tomahawk "could be plainly traced by means of a dark line of decayed wood." When these flat celts are ornamented, it is by means of rather savage patterns, like those on Australian shields, indented with punches. The next stage in the evolution of the tomahawk head is where the sides have been hammered in, so as to make "flanges," which curve over the narrower part of the blade. The flat blades, we presume, were hafted like the old stone blades, by being driven into a cleft stick. But the curved flanges gradually became a kind of socket, which would hold the handle of a haft shaped like a common walking-stick or umbrella-handle. If one wanted to haft a flanged celt, one would split the crook of a walking-stick, push the celt between, so that the flanges overlapped the wood on each side, and then bind all round with cords or sinews of animals. A "stop-ridge" of metal, half way down, prevented the tomahawk head from being driven too far into the stick-handle. The next step was to hammer the flanges down till they almost met each other, thus making two rude sockets for the stick. The next improvement was to make a regular sunk socket, like that in the head of a modern arrow, and into this socket the handle of the walking-stick was thrust. Yet the flanges did not disappear, though they had become useless. They remained in the shape of ornament, as in figure 110 (p. 109). The little loop at the side

* *The Ancient Bronze Implements, Weapons, and Ornaments of Great Britain and Ireland.* By John Evans, D.C.L., LL.D., F.R.S., &c. London: Longmans & Co. 1881.

of the socket was probably intended to hold the string which was used in fastening the tomahawk head to its stick. Ornaments in relief now came in, and superseded the old punched chevron patterns. Mr. Evans remarks:—

As an illustration of the view that similar wants, with similar means at command with which to supply them, lead to the production of similar forms of tools and weapons in countries widely remote from each other, I may mention a socketed celt (10½ inches) found in an ancient grave near Coplago, Chilli. In general form it is almost identical with some of the Italian bronze celts, but it is of copper, and not bronze, and it is not cast, but wrought with the hammer. The socket has, therefore, been formed in the same manner as those of the early iron celts from Hallstatt, with which it closely corresponds in outline. The surface, however, has been ornamented by engraving, and among the patterns we find bands of chevrons, alternately plain and hatched, closely allied to the common ornament of the European Bronze Age. What is, perhaps, more striking still, is that the Greek fret also occurs as an ornament on the faces.

Man, in short, does pretty much the same things, uses the same patterns, tells the same myths, and practises the same queer customs all over the world in his savage and barbarous periods.

Our own axes, as every one knows, are hafted on a very different principle from the old tomahawks, that needed what the Scotch call "a nibby stick." Perhaps the first step to a socket driven through at right angles to the blade is to be found in a very queer celt in Mr. Evans's collection, which was found at Raron, in the Valais. It is, in form, like the crooked bone handle of an umbrella removed from the stick, with its silver socket attached.

The reason why it should have been cast in this manner is probably to be found in the fact that boughs of trees, with a smaller branch at right angles to them, are not easily met with, though such boughs are best adapted for conversion into the helve of this kind of hatchet. Some ingenious bronze founder of old times conceived the idea of producing a hatchet which did not require a crooked helve, but for hafting which any ordinary straight stick would serve, and we have here his new form of axe-head.

If he had driven his socket through, and shortened his blade, he would have produced something like the modern axe. Metal was perhaps too expensive for this system of axe-making to become fashionable. Among other reasons which prevented the introduction of the modern axe-head, Mr. Evans gives these:—

When first bronze came into use it must have been extremely scarce and valuable; and to cast an axe-head in bronze, like one of the perforated axe-hammers of stone, would have required not only a considerably greater amount of the then precious metal than was required for a flat hatchet-head, but would also have involved a far higher skill in the art of casting. Moreover, the flat form of these simple blades rendered them well adapted for being readily drawn out to a sharp cutting edge, and when once they had come into general use they would not have been readily superseded by those of another form, hafted in a different method, even were that method more simple. If the bronze celts were mainly in use for peaceful industries, while the warlike battle-axes were made of stone, the progressive modifications in the shape of the former would be less likely to be affected by the characteristics of the latter. It must also be remembered that in France, which then as now set the fashion to Britain, perforated axe-heads of stone were very seldom used, and those of bronze were in the north of the country unknown.

But we cannot hold with Mr. Evans (p. 161) that the feat of shooting an arrow "through the iron" of several axes set up in a row proves the modern perforated socket to have existed in Homeric Greece. This is the view which Mr. Merry took in his *Odyssey* (the smaller edition, vol. ii.). It is hard to see how a standing or a seated archer could shoot so low as this theory requires. Goebel, on the other hand, thinks Odysseus shot through the sort of ring formed by the meeting of the two blades of the double-headed axe. But we are aware of no such axes in early Greek remains, those from Mycenæ being hammer-headed. In a metope at Selinus, one of the figures uses an axe, somewhat of the Lochaber pattern, through a wide opening in the head of which it would be easy to shoot (Benndorf's *Metopen von Selinus*, pl. 7). And on the whole we think that an axe somewhat of this shape must have been in the mind of Homer when he described the feat of Odysseus.

Though we have been tempted to linger over the axe-heads, Mr. Evans's remarks on and designs of bronze daggers, razors (very queer pieces), torques, ear-rings, and swords are not less interesting than his chapters on celts. His Irish bronze fish-hook (p. 192), although he does not remark on the coincidence, is of the "Limerick bend," still used in Ireland. We do hope that no jeweller will imitate the taste of the Bronze Age in coal-scuttle ear-rings (p. 392), which are exquisitely ugly. Torques and bracelets in better taste, for example the bracelet in figure 485, have already been imitated in gold.

THE METROPOLITAN AREA.*

IN the reign of Henry VIII. an Act of Parliament made Westminster a City. In the reign of Queen Victoria an Act of Parliament has made the said City and certain other districts surrounding London into the "Metropolitan Area." We have, therefore, the highest possible authority for calling by an epithet which is very like the one appropriate to "Metropolitica" Canterbury the ring of suburbs which is without the jurisdiction of the Lord Mayor. The anomalies of London nomenclature cannot be better illustrated than by this example. Indeed, at a recent banquet given by the Chairman of the "Metro-

politan" governing body, the word "metropolis" was more than once used by the speechmakers in contradistinction to the word "London." A loose and incorrect use of names and epithets will perhaps last as long as men themselves; but the confusion here indicated is such that no plain statement of the facts will quite unravel it. The City, or "shire" of London, on the confines of the shires of Middlesex and Essex, is situated about sixty miles from the metropolis, which is a city in Kent. It is not necessary, except in children's books of geography, to assign a "capital" to every county; but perhaps we may say that Brentford is the capital of Middlesex because the elections come off there, Colchester of Essex, and Maidstone of Kent on account of the assizes. This is not strictly correct, as it is not possible in England to use the word capital as the Americans use it when they appoint a certain town, city, or village, not necessarily the largest, to be capital of a State. We have no such capitals; and some may consider Olerkenwell rather than Brentford the capital of Middlesex, and Canterbury rather than Maidstone of Kent. But about the metropolis there can be and is no such difficulty; and few people can hesitate about calling London the capital of England and Canterbury its metropolis. Yet it would be more correct to say that Westminster is the capital of England; and as to the word metropolis, we have Parliamentary authority for applying it to the suburbs of London and certain villages and districts in Middlesex and the adjoining counties. At Westminster are the Houses of Parliament, the law courts, and the royal palaces, for Kensington, Buckingham, St. James's, Whitehall, are all within the precincts of St. Margaret's. The new Law Courts will equally be in Westminster, though portions of the east wing are within the city boundaries.

The use of the word "metropolis" as applied to London is of some antiquity. In De Laune's *Present State of London*, published after the Great Fire, though the author himself does not use the term, an admirer who sends him an "Acrostick" does not hesitate to turn a rhyme with it; but the character of his authority may be judged by the opening triplet of the poem:—

This is the City which the Papal Crew
Have by their Damn'd Devices overthrow,
Erected on her old Foundations, New.

When the Board of Works was formed in 1855, under Sir Benjamin Hall's Act, the word was boldly assumed; and the Board is appointed "for the purpose of diverting the sewage of the metropolis." Thenceforth this, so to speak, diverting use of the word has been usual; and the Board now deals with the whole Hundred of Ossulston, the Hundred of Isleworth, certain districts on the southern side of the Thames in the counties of Kent and Surrey, and part of Essex. This constitutes the "Metropolitan Area"; but London, which probably the framers of the Act contemplated under the name of the metropolis, is itself manifestly excepted.

The immense size of this area is denoted by some of the figures mentioned in the annual Report of the Board. The rateable value is twenty-four millions and a half sterling; the money spent during a year is two and a half millions. Haedeker's *Handbook*, of which a new edition, the third, is before us, enumerates, besides the nine Parliamentary boroughs, each sending two members to the House of Commons, no fewer than sixty distinct "villages" which have in course of time become constituent parts of London. The area is occupied by several thousand streets, "which, if laid end to end, would form a line 2,600 miles long." There are more than half a million different buildings and eleven hundred churches. Within the police district the population is fully four millions. "There are in London more Scotchmen than in Edinburgh, more Irish than in Dublin, more Jews than in Palestine, and more Roman Catholics than in Rome." Compared with the Metropolitan Area, even New York and Paris, the two cities of the world which come nearest to it, are so far behind that both put together would only equal it. The six towns of Great Britain which come nearest to it are Glasgow, Liverpool, Manchester with Salford, Birmingham, Leeds, and Sheffield; but the population of all put together does not equal that of the Metropolitan Area, even if the City of London be taken out. In his speech at the recent dinner given by Sir James Hogg, the Duke of Connaught mentioned that since it came into being the Board has made 65 miles of main sewers, besides making or renewing 165 miles of smaller drains. The immense cost of works in the Area, the gigantic scale on which everything has to be done, may be gathered from some of the figures given in the annual Reports. The Embankments cost three millions of money. The Fire Brigade numbers more than five hundred men; and there were more than one thousand eight hundred fires last year. About quarter of a million has been paid for freeing bridges in the same time; and nearly 40,000*l.* for property through which new streets are to pass. No fewer than one hundred Acts of Parliament referring to the work of the Board have been passed in the twenty-six years of its existence. The main drainage system cost four and a half millions, and Haedeker's *Guide* thus sums up a few of the statistics:—"There are annually consumed about 2,000,000 quarters of wheat, 400,000 oxen, 1,500,000 sheep, 130,000 calves, 250,000 swine, 8 million head of poultry and game, 400 million pounds of fish, 500 million oysters, 1,200,000 lobsters, and 3,000,000 salmon. The butcher's meat alone is valued at 50,000,000*l.*"

The most extraordinary thing about this enormous and practically anonymous "Area" is the looseness of its governing system. It has no governing system, in fact. Every parochial vestry does what seems right to itself. The Board of Works is not a govern-

* Haedeker's *London and its Environs*. Third Edition, revised. London: Dulau. 1881.

ing body, and has really been called into existence by a kind of accident. The neighbouring City of London is admirably organized, and might be an example in this respect to the Area. If its night population goes on decreasing at the present rate there will some day be more common councillors, aldermen, and sheriffs than sleepers. The City sleeping population, which eighty years ago was more than one hundred and fifty thousand, has dwindled to one-third of that number. On the other hand, the suburbs, if the recent census returns are correctly reported, have increased in population by more than half a million of souls—not in eighty years, but in ten. The question is constantly cropping up in Parliament and out of Parliament, Are we to let this immense population govern itself as heretofore, in the old hole-and-corner or parochial way, or is it to be organized, superintended by a governing body, and, in a sense, consolidated? If this question is answered in the affirmative, then comes the further question as to the kind of government—Is it to be a Corporation or a Board? Is it to be a kind of magnified vestry, a vestry of vestries, or is the old City organisation to be extended so as to take in the suburbs? This was the old course of action. When Fleet Street was built the City formed the new ward still called Farringdon Without. This is only one of several examples. The Abbot of Westminster stopped the way westward. His rights, which formerly extended to the wall, were infringed. The Abbot's successors, the Dean and Chapter, still present to St. Bride's, which at some remote period must have been a chapel, or, as we should say, a district church, in the vast parish of St. Margaret's, Westminster. A writer in a new magazine, *Our Times*, has stated the question very carefully in two successive chapters. The writer is one of those people who regard civic hospitality with something like indignation, and may be supposed to think that the army of cooks, waiters, purveyors, and wine merchants who are benefited by a banquet in the Mansion House should not be allowed to live. Political economists generally run away with some part or other of their subject, but on the whole the writer states his views with moderation. He has, however, no mercy on the Corporation, and would even deny them the merit of having purchased and preserved Epping Forest and Burnham Beeches. The spirit which animated the City was not, he asserts, love for "the people of the metropolis, but antagonism to the Metropolitan Board." To prove this he tells the story of the grain dues. The City claimed a right to certain metage duty on grain coming into the Port of London. This was resisted by a well-known brewing firm. "At a point in the litigation, the charter granting this tax was ordered to be produced." The City, however, "preferred not to produce its charter." So says the writer; and he goes on to tell us, somewhat obscurely, that "the suit died out." Now, if he had turned to Norton, or any other writer on the subject of London law, he would have found that the metage of grain was a very ancient and unquestionable right of the City. His subsequent remarks, in which he describes the Corporation as introducing a Bill to revive this right, and proposing to devote the proceeds to the purchase of the open spaces alluded to, though verbally true, convey a false impression. We are not particularly concerned for the City; but even Corporations are entitled to fair play. The writer from whom we have quoted complains rather that the powers of the Board are too circumscribed than that they are too extensive. When it essayed to deal with the water supply, the official auditor disallowed the expenditure, which had amounted to 16,000*l.*, "and a special Act of Parliament had then to be passed to enable it to pay the same out of the rates." All its costs and charges before Committees of the House of Commons on railways, gas, and other suchlike matters are "illegal, and could be objected to by any ratepayer. Such," continues the writer, "is the discreditable government of the Metropolis of the Empire." To many people this remark will appear a *non-sequitur*. It is nothing discreditable that government is carried on by a system which gives every taxpayer a control of the expenditure. On the contrary, such a government system is strictly in accordance with one's ideas of the principles of the British Constitution. It still remains to be proved that the "Metropolis of the Empire" would be cleaner, richer, healthier, more moral under any other system.

AYALA'S ANGEL.*

THE least attractive part of Mr. Trollope's latest novel is the name, which is likewise misleading. Imagination suggested an Oriental romance, although that seemed scarcely in harmony with the special genius of the writer. In reality, Mr. Trollope remains on the familiar ground, presenting us again in the course of the story to more than one of our old acquaintances. Ayala Dormer is a genuinely English girl, whose father being an eccentric artist, with an admiration for the fanciful and gorgeous, had simply carried to a somewhat extravagant length the fashion of christening children by fancy names. It seems besides to have been but a passing caprice; for Ayala had a sister older than herself, who bears the sweeter and more homely name of Lucy. The names, we may assume, to be expressive of their dispositions. Lucy is pretty, graceful, and unassuming, with good sense that is slightly leavened by romance, and no small share of quiet resolution. Ayala is as pretty, or perhaps more so, looks being a

question of taste; but her beauty is in a different style. She is bright and piquante; she is outspoken and waywardly impulsive; she loves admiration, of course, though fastidious as to the gentlemen who offer it; while as for romance, in place of being merely tinged by it, it appears to be the very essence of her nature. At all events, it forms the motive of the behaviour on which the interest of the novel mainly turns; prompting her consciously to the acts of suicidal folly which well-nigh make shipwreck of her happiness and life. Ayala's Angel is an imaginary "angel of light," of whom we hear more than enough, *à propos* to her maiden meditations, though that resplendent figure of her lively fancy plays an important part in Mr. Trollope's plot. She has set up an image in the inner sanctuary of her heart, attributing to it every masculine fascination, moral or physical. When she meets in the actual world the counterpart of the cherished idol, then she will marry, but not before. As may be supposed, should Ayala prove constant to her purpose, there is every prospect of her dying unmarried, however her days may be prolonged. Of three gentlemen who tender her their hands and fortunes, two have as little of the popular conception of an angel in them as can well be conceived. Both are thoroughly prosaic, and one is objectionably vulgar. As for the third, there are glimmerings of doubt, when Ayala takes time for consideration and self-examination. Colonel Stubbs lives in the best society; he is brilliantly popular; he is clever, and a distinguished soldier to boot; and Ayala, who heartily likes him from the first, is persuaded that he fully deserves his popularity. His frank manner is irresistibly winning; what would be impertinence, or at least over-assurance, in another man, seems in him nothing more than natural *bonhomie*, and on the very shortest acquaintance she comes to treat and trust him as a brother. When Colonel Stubbs proposes to the penniless orphan, there is not a lady or lady's maid under the aristocratic roof-tree of Stalham who does not consider her a most fortunate girl. Ayala must certainly have come to the same conclusion had it not been for the absurdly romantic turn of her mind. As it is, although she likes and even looks up to Colonel Stubbs, his first proposal appears preposterous, if not positively sacrilegious. It is impossible that any angel of light should appear to her bearing the Christian name of Jonathan and the surname of Stubbs. It is still more out of character that he should have fiery red hair, with a mouth that, although good-natured and intelligent, absolutely stretches from ear to ear. So, yielding to an impulse she cannot resist, she dismisses him with the negative the Fates have dictated. Colonel Jonathan Stubbs goes away sorrowful, but not altogether cast down. Fortunately for Ayala, he has set his heart on having her for his wife, and, so long as she shows him sisterly regard, he is not a man to be easily discouraged. As for her, after each successive rejection of his suit she regrets with ever-aggravated intensity the answer that has escaped her. Her wayward persistency in playing fast and loose with her own future is at once perverse, provoking, and improbable. Although romantic, Ayala was no fool; and she was just the girl to be influenced by the opinions of the ladies of greater experience and higher position who had graciously taken her by the hand. She had every motive to make a suitable marriage which could sway a young woman of her pleasure-loving temperament; for wedlock offered her an escape from the dulllest of homes, in which she lives secluded from the society she delights in. But the fact of her conduct being inexplicably irritating gives the story an interest which it would not otherwise possess. We feel fully assured from the first that Colonel Stubbs will be successful in the end. But the girl's eccentric behaviour is very naturally a puzzle to the many people who have interested themselves in the Colonel's love affair; and Mr. Trollope ingeniously exercises their minds in speculating on her feelings and the explanation of her caprices.

Ayala is pretty and fascinating, no doubt; she tempts her suitor on by the unpleasant surprises she prepares for him when he believes himself tolerably sure of a gracious reception. But we agree with the Colonel's good friend and cousin Lady Albury, that Miss Dormer hardly deserves the trouble she causes him. She is no Lily Dale or Grace Crawley. So far as we can see, there is little in her. She has perversity and fits of obstinacy, but no real decision of character; while the Colonel is perhaps as masterly a male character as Mr. Trollope has drawn in any recent book. He is the sort of good fellow who seems to be born to go through the world with the regard of all whose regard is worth having. Like Thackeray's Dobbin in *Vanity Fair*, he gradually impresses you with a sense of his power as well as of his sterling worth. You feel that his judgment is to be relied upon; that he may invariably be trusted to say or do the right thing; and that there is no one you would sooner consult on delicate matters or in a difficulty. The men seem hardly to grudge him the golden opinions he wins from the women. He is far plainer than Dobbin; but, unlike Dobbin, he is in no way awkward. On the contrary, he is a ready man of the world, who knows well how to make the most of himself, and who finds his advantage in the knowledge. And the masculine side of his character, as the story goes on, is thrown out into stronger and stronger relief, more especially in his dealings with Tom Tringle, one of his rivals. Tom, although the heir to untold thousands, and although he ought to have benefited by not only a good, but a fashionable education, is represented as a lout offensively given to gorgeous dress. Thanks to his awkward shyness and his superb costumes, he is snubbed mercilessly by many people as well as by his cousin

* *Ayala's Angel*. By Anthony Trollope, Author of "Dr. Thorne," &c. London: Chapman & Hall (Limited). 1881.

Ayala, who will have nothing to say to his repeated offers. As it happens, he once did the Colonel some little kindness in a foreign hunting-field, and the Colonel is grateful. Though by no means blind to the youth's very conspicuous foibles, he stands up for Tom, whom he maintains to be an excellent fellow. He is persuaded that Tom is by no means the fool he looks, and that he has the makings of a gentleman in him, notwithstanding superficial vulgarities. So, popular as he is, he goes out of his way to win the young man by little civilities. He invites him to his quarters at Aldershot, and Tom is proportionately flattered. If the Colonel has any object beyond his constitutional good nature, it is to influence Tom into doing himself more justice. So strong is the influence that Tom turns to the Colonel, though that gallant officer is but a slight acquaintance, for counsel as to the prosecution of his suit. Of course, in the circumstances, he could hardly have fallen on a more inappropriate adviser; and it costs this other lover of Ayala a considerable effort to carry on the conversation without betraying himself. Tom, who is very much in love, very miserable, very angry, and very unreasonable, chooses afterwards to resent the Colonel's having accepted his confidence without giving his own in the way of reciprocity. Under the united inspiration of love and liquor, he goes so far as to assault his false friend in the street. Fortunately the Colonel's credit for courage stands so high that he can afford to accept the insult passively. The surrounding crowd passes unflattering comments on his inaction; but the nobility in Tom's nature is touched. He is absolutely disarmed by a man of Stubbs's high spirit returning good for evil, and trying to screen him from the consequences of his folly; although at the same time he feels even more aggrieved than before at being robbed of the possibility of revenging his wrongs. It is true that the Colonel, although he had acted on high principle or generous impulse, is no loser in the end. The story gets wind, and comes round to Ayala's ears, and with that romantic young woman it goes a long way, as we should have supposed, towards investing him with the spirituality of her "Angel of Light."

But besides Colonel Stubbs there are sundry other people, in a novel almost overcrowded with characters, who merit something more than a passing notice. Sir Thomas Tringle, the father of our young friend "Tom," is as graphically conceived as he is true to probabilities. No doubt he is a Philistine of the Philistines, who delights in money-getting and the consequence it gives him, and who seeks relief from domestic worries in manipulating millions in the City. But, according to his lights, though his ideas are limited, and although he loves his own way almost to the point of pigheadedness, he is a singularly large-hearted and generous man. With some reason, he considers money a specific for most human sorrows, and he benevolently deals wholesale in heavy cheques. In the hospitality he exercises as head of his lavish household he is the financial counterpart of the clerical Archdeacon Grantley. And there is considerable humour in his transactions with his son-in-law and his intending sons-in-law, as with his relations to his unmarried daughter and nieces and their lovers. We understand how he grows gradually to detest his son-in-law the Hon. Mr. Traffick, although originally proud of the connexion with that nobly born hero of red tape. Knowing Traffick to be almost penniless, he gladly gave his daughter a portion of 120,000*l.* But the meanness of Mr. Traffick, who insists on spurning on him after marriage, in place of setting up an establishment of his own, is altogether antipathetical to the free-handed City gentleman. On the other hand, he is almost gained over by Frank Houston, although at the first he had set his face as a flint against that gentleman's addresses to his younger daughter, apparently because Houston, with somewhat ambiguous manliness, maintains independence of language in an embarrassing position, and more than insinuates that he regards marriage with Miss Gertrude simply as an easy and creditable profession. Ayala's sister, Lucy, is comparatively dull, although we do not question that she will make a wife who will wear well. Among the many ladies who play subordinate parts, we think we like Lady Albury best, whose platonic affection for her cousin Jonathan might easily have been changed into something warmer, had the Colonel been heart-free and she unfettered. We shall only add that, in our opinion, Mr. Trollope has never showed to more advantage than in those dialogues which he generally succeeds in making extraordinarily lifelike.

GORDON'S CENTRAL AFRICA.*

WHEN Colonel Gordon, after a brilliant career of victory in China, where he crushed a rebellion that was desolating the fairest provinces of the Celestial Empire, transferred his services to the Egyptian Government, it seemed as though a decisive blow was at length about to be struck at the iniquities of the slave trade in Africa. Had it been possible for a single individual to suppress this inhuman and debasing traffic, Gordon Pasha was the man. The province which he undertook to organize was scarcely within the pale of even the civilization of the East; for years it had been in the hands of adventurers, who had thought of nothing but their own profit and aggrandizement, and had traded in ivory and slaves, regulating their

commerce, if such it could be called, by armed force. The Governor of the Soudan had nominal control over these "slibusters," but his authority had never made itself really felt; the Khedive, therefore, resolved to form the district in which their operations were carried on into a separate government, and to monopolize the trade of Equatorial Africa, with a view to ultimately throwing it open to the world. The lesson was to be plainly taught "that mere difference in colour does not turn men into wares, and that life and liberty are sacred things." The native tribes also were themselves to be coerced or conciliated, and the practice of the wholesale capture of prisoners sternly repressed, lest, if he did succeed in putting a stop to the slave trade, these unfortunate creatures should be slaughtered for want of a market. The story of Colonel Gordon's loyal attempt to carry out this programme in the face of unheard-of difficulties on the spot, and less than half-hearted support from the slave-holding Government at headquarters, is told in the volume before us, in his own words, ably and judiciously edited by Dr. Hill. Egyptian conquest in Africa is essentially a thing of recent date, for although her fortified outposts are now found between the Albert and Victoria Nyanza Lakes, the empire of the Pharaohs scarcely reached to Khartoum. By the subjugation of Darfour, however, the Egyptian frontier now comes within less than fifteen days' march of Lake Tchad, while in the east lands have been annexed which are washed by the lower part of the Red Sea and the Gulf of Aden. Traders, Europeans amongst the number, had penetrated into Equatorial Africa, but the ivory was found a less profitable source of merchandize than human goods and chattels, and the vast district became the hunting-ground for them.

The suffering and devastation created by the slave-traders, and the atrocities they committed, are almost beyond belief; within twenty years the eastern shore of the Victoria Nile has degenerated into a mere forest waste, the population has been diminished by at least two-thirds, and all traces of progress have been obliterated. The Egyptian officials, themselves inveterate slave-dealers, encouraged and participated in these horrors, and the Khedive, when he was at last induced to move in the matter, did so from no sympathy with the cause of humanity, but only through dread of the too numerous bands of slavers developing into a rival Power. One of these men was possessed of almost fabulous wealth, lived in a style of regal barbarity, and owned no less than thirty fortified stations carried into the very heart of Africa, where the slave-trader exercised absolutely despotic rule. An insufficiently equipped expedition against this person was defeated, and the Khedive, being powerless to avenge the disgrace, the trader, Sebehr Rahama by name, reigned as little less than an independent sovereign and threatened the annexation of the entire Soudan. But for these pretensions we should probably have heard but little of Ismail Pasha's desire for the suppression of the slave-trade, and there is no doubt but that Colonel Gordon was sent more in the interests of the Viceroy's supremacy than in that of humanity. Sebehr, unluckily for himself, but fortunately for the country, went to Cairo to assert his claim to the title of Governor-General, and was there detained; but his son broke out into a formidable revolt, the history of the repression of which forms one of the most interesting chapters in the book. For the first three years, however, Colonel Gordon did not come into collision with this ruffian, though the other slave-dealers gave him plenty of occupation. In his most arduous task he received no support whatever from any officer of the Egyptian Government. "The Khedive," he writes, "gave me a firman [a decree] as Governor-General of the Equator, and left me to work out the rest." By the year 1876 "things were generally consolidated," but his advance to Lake Victoria was met with determined opposition from the native chiefs, and Colonel Gordon returned "with the sad conviction that no good could be done in those parts, and that it would have been better had no expedition ever been sent." Indeed, from the beginning he seems to have despaired, as well he might, of the success of anything that depended upon the good faith of the Cairo "ring," for on the very first page occur the ominous words, "I think I can see the true motive now of the expedition, and believe it to be a sham to catch the attention of the English people."

The slave-traders of course were in accord with the local authorities, and thought to find an easy dupe in the Frank Governor-General, but soon found themselves mistaken. Some letters addressed to the Mudir, or District-Governor of Fashoda, were accidentally intercepted, and one of them said—

"I am on my way to you with the 2000 cows I promised you. . . . and with *all* to satisfy your wants." These cows they had taken from the tribes around them—a robbery; and "*all*" means a number of slaves. The other letters were to different people, saying, "I bring you the negroes you asked for, who, I hope, will please you," and others to the same effect. Now these slaves do not know that I am on the way to the Mudir of Fashoda, and that I am prepared to seize them all. I shall confiscate the 2000 cows, for I cannot give them back to the far-away tribes from whom they were stolen. I shall seize the slaves, and take them back to their homes, if I can; and I shall punish the slave-dealers. The road by which this convoy comes crosses my present camp here.

On another occasion he boarded two boats and found 105 slaves stowed away under some wood; this cargo, together with 2,000*l.* worth of ivory, was promptly confiscated. Here is another instance of the scoundrelism with which Colonel Gordon had to contend, and of the manner in which he met it:—

Wal el Mek had some difficulty in getting porters from a sheikh to carry some ivory. He was drunk, and at once ordered the man to be hanged, which he was. I need not say that it is more than probable that Wal el Mek will be hanged also.

* *Colonel Gordon in Central Africa, 1874-1879, from Original Letters and Documents.* Edited by G. B. Hill, D.C.L. London: T. De La Rue & Co. 1881.

Colonel Gordon was only twenty-one days on the way from Khartoum to Gondokoro, Sir Samuel Baker, his predecessor, having taken over eighteen months to accomplish the same distance. The reason for this was that the latter was detained by the *sudd*, which had fortunately opened on the arrival of the new Governor of the Equator. What this is the reader can best judge from Gordon Pasha's own words:—
